A new variety of willow, or rather one of which the merits are of recent discovery, is attracting attention in the West, particularly along the Missouri River Valley. It is popularly known as "Diamond" Willow—sometimes as "Post Oak," getting the first name because of the frequent, peculiar, diamond-shaped indentations in the wood; and the second, on account of its durability, especially under ground. The latter characteristic is certainly new of the willow family, which is noted for soft, perishable wood. The red, or inner wood very much resembles red cedar, and is almost as durable for any purpose—fence posts even. The writer has in his possession specimens of wood with regard to whose use and exposure he has had personal knowledge for twelve years. For seven years it was used as a fence rail; for five it lay in the grass and weeds along the fence row; yet it is now as sound and well preserved as cedar would have been under like conditions. Old settlers in Missouri bottoms say they have used it for many years as fence posts, and find it equal to anything they have tried.

I will not attempt a minute botanical description other than to say that in all respects it very much resembles the Black Willow—Salix nigra. It is not abundant anywhere I know. It is, so to speak, clanish, or gregarious, growing in patches or groups by itself. It is not of rapid or rampant growth, like other willows. The wood is straight, close-grained, and splits as smoothly and nicely as cedar. It grows to the hight of a good-sized tree, eighteen inches to two feet in diameter, and the wood finishes beautifully under the plane and turning-lathe.

We hear of it more in the mountains North and West, warranting the inference that, while seemingly indigenous along the Missouri River, its real home, or habitat, is in the higher altitudes. I know of no specimens growing off the Missouri, on any of its tributaries below Fort Benton or thereabouts. I have specimens growing from cuttings on the high, upland prairie, showing a stand and growth better than those of any other cuttings of the same season on my grounds.

Specimens have been sent both to Prof. Sargent, of the Arnold Arboretum, Cambridge, Mass., and to Dr. J. A. Warder, President of the American Forestry Association, North Bend, Ohio, but neither of them, as yet, has given it a botanical name or habitat. Prof. Sargent says: "It is foreign, and closely allied to Salix alba. It is very interesting and important, from the fact of its being durable under ground." With Prof. Sargent, I regard this willow as "interesting and important," and will watch its future with interest.

To experimental grounds or individuals who will test it, I will be pleased to furnish a few cuttings in season, *gratis*. There is no patent on it. It is Nature's gift. If valuable and worthy, let the public have the benefit of it.

Brownville, Nebraska.

[Gov. Furnas sends a specimen of the willow referred to, ten inches long by nearly two in diameter. The outside is white and close-grained, while 1½ inch of the diameter is of the color of the red wood of the Red Cedar. —Eds.]

Pomological.

IOWA EXPERIENCE WITH ORIENTAL PEARS.

PROFESSOR J. L. BUDD.

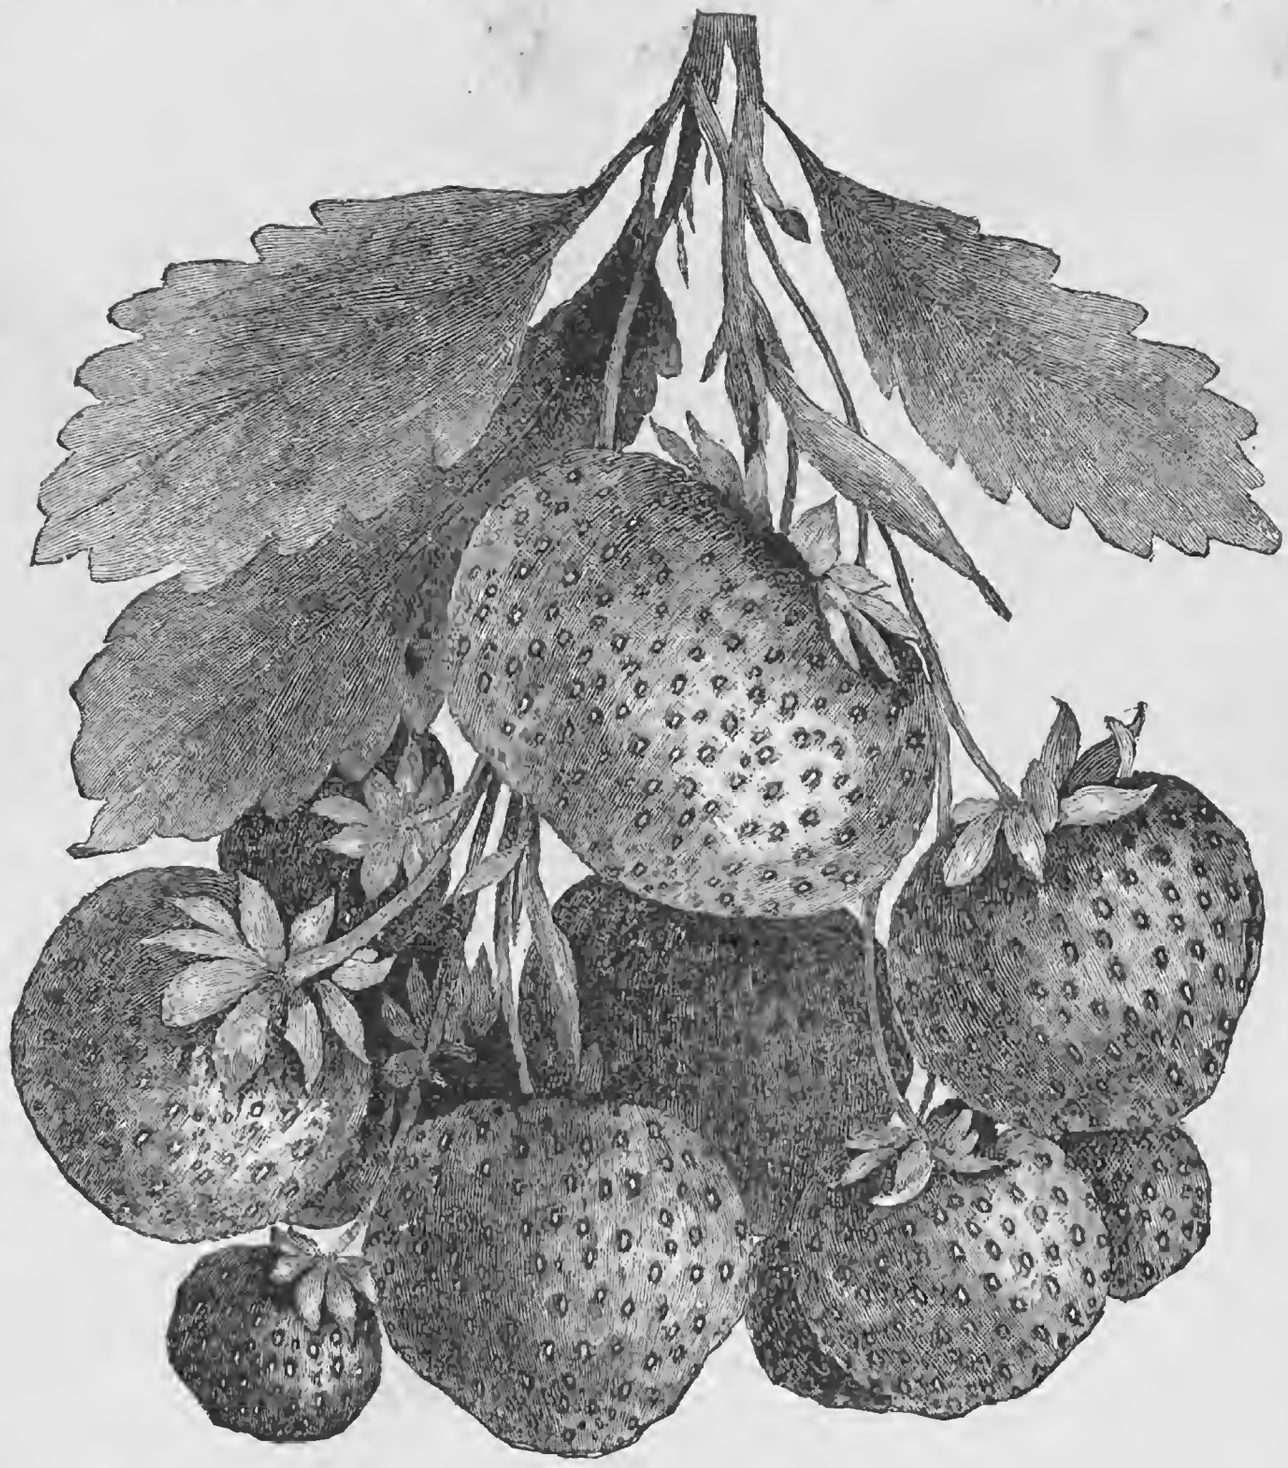
During the past two years I have been experimenting in a small way with quite a large number of Oriental pears. Many of these have been obtained from the grounds of the Agricultural College near Moscow and from the Botanic Gardens at St. Petersburg, Russia, yet I place them under the above head for the reason that recent researches have traced their original home to Northwestern China. Some of them, I am assured, are recent importations from the Province of Shensi, China. My experience is yet limited, but it so happens that our past Winter was one of almost unexampled severity, and it was followed by a Summer exceptionally trying to the foliage of all trees. As an instance, we had in this section a rainfall, in five days, of 17½ inches, about three weeks since, which was followed for three weeks by high temperature and aridity of air such as are never known in the Eastern States. Under such circumstances my observations of two years may have some value. Reserving the privilege of modifying any opinion expressed, as I gain new experience, I will offer a few notes on Chinese pears from my present stand-point.

Leaving out the many confusing names which botanists have given to the Asiatic forms of the pear, I will speak of the races under the names by which they are known in China:

Sha-li, or Sand Pear.—This seems a semi-tropical race. Its ability to endure tropical heat has caused its name—Sand Pear—to follow it from its home in Southern China through India, and to the hot, dry plains of Australia, where Sir Walter Hill states it thrives and fruits where no other known pear can live. In our country the Le Conte and other varieties of the Sand Pear succeed better in Florida than any other sorts yet tried. Our thirty or forty varieties of the Sand Pear, and crosses with the common pear, were models of health during our hot, dry Summer, but the October freeze of the Fall of 1881 caught them napping. At present I do not think that one of them will endure our ordinary Winters with sufficient vigor retained to produce a crop of fruit.

Pei-li, or Snow Pear.—The Hon. S. Wells Williams, of Salem, Mass., and others who have spent several years in Northwestern China, assure us that the varieties of the Snow Pear are globular, white, juicy, and generally regarded as the best fruits of the country. The varieties we have are very upright in growth, and their leaves are nearly as large and thick as those of the Sand Pear, but, unlike the latter's, they are nearly entire, some of them having only a slightly wavy edge covered, in their early stages of growth, with peculiar silky hairs. The surfaces of the young leaves, buds and branches are tomentose, and show traces of the same silken threads or hairs. It has been claimed that William R. Prince grew seedlings of the Snow Pear and disseminated them fifty or more years ago. This may be true, but no specimens I have seen have any resemblance to the true Snow Pear, such as we have from Moscow, and the leaves of which we have received from Peking. I have much faith in this race of the pear, which is common in nearly all parts of Northern Europe and Asia. The plants stand our Summers and Winters about as well as do the Russian apples.

Kuang-li, or Strawberry Pear.—This gets its name from its peculiar flavor, of which Karl Koch says: "The story was told me in the East that its peculiar flavor came from a



JERSEY QUEEN. FROM LIFE. FIG. 427.

cross with the quince. This I do not consider very improbable." As grown around Peking, China, this race is shaped like our Bergamots, and Koch—the highest modern authority on the origin and races of the pear—gives the decided opinion that the Kuang-li of Northern China is the original type from which all the Bergamots have descended. Some of those of this class we have from Moscow have the prefix Bergamot. As an instance, one of our strongest growers, the first year in the nursery, is called Bergamotte Sapieganka. We grew last season plants five feet in hight of this variety from short cions whip-grafted in the cellar on apple roots. Yet every terminal bud was perfect before the advent of the first severe frost. But all the varieties of this class are, to quite an extent, crooked growers in the nursery. Some of them want to go in every direction except up.

These Northern Bergamots seem very hardy when they go into Winter in the right condition. Last year the foliage was healthy, and not a twig was injured. I now notice that our recent trying weather has a tendency to curl the leaves, as it has curled those of the cherry and of most sorts of the apple. It may prove that the foliage will not fully meet our climatic requirements. All things considered, they do not seem as promising as the more globular Snow Pears.

Agricultural College, Ames, Ia.

AGRICULTURAL FAIRS AND POMOLOGY.

PRES. T. T. LYON.

Suggestions for Exhibiting and Judging Fruits, etc.

PROBABLY in no branch of agriculture is the necessity of careful discrimination, and of great accuracy, on the part of both exhibitor and observer, more important than in horticulture and especially in that branch of it known as pomology, not only on account of the immense number of varieties of fruits grown; but equally on account of their disposition to vary under change of soils, difference of seasons and other circumstances. Hence I submit the following suggestions:

1. No general exhibit of fruits should be attempted, except under the superintendence of an expert, or a committee of experts in the nomenclature of fruits.

2. No fruit should be permitted to appear on exhibition under an erroneous name; and, if doubtful, it should be so marked.

3. The exhibition of large and showy but worthless sorts, should be discouraged; and, if shown as a means of education, such worthlessness should in some manner be clearly indicated to visitors.

4. All wormy and imperfect fruits should be excluded from competition for premiums, if not even from exhibition.

5. All names of fruit exhibited should be distinct and clear, and should be so attached to the fruit or dish containing it, as not to be liable to accidental displacement.

6. No person, whether exhibitor or visitor, should in any case be permitted to handle fruits when once placed upon exhibition, except by permission either of the superintendent or the awarding committee in discharge of their duties.

7. Committees should be definitely instructed to base their awards—1st, upon the varieties, only, which have been correctly named by the exhibitors; 2nd, upon the value of the varieties for the required purpose, whether general or special; 3rd, upon the color, size and evenness of the specimens; 4th, upon their freedom from insect marks or other blemishes.

8. The exhibitor should be required to submit a list of the varieties in each entry, arranged in the order of their value for the required purpose, *in his estimation*, and the committee should be required to report the lists to which premiums have been awarded, arranged as estimated by such committee for such purpose.

9. It would seem that, with the growing importance of this whole subject, we have reached a point at which some influential authority, (as by preference, the American Pomological Society) should frame and submit for general adoption, a full set of rules or principles covering this entire subject, as a means of inviting unity and harmony of action thereon.

Every person possessing ground for a tree or a patch of berries should ignore the peripatetic "tree agent," and the nurseryman as well, and should, instead, look over the fruit lists of the societies, or the standard pomological works, or both, and go to the fairs, and make the actual acquaintance of these fruits and of those who have grown them, after which he will be able to choose wisely for his own individual purpose. To such I suggest:—

1. Never choose a variety for your own use upon its popularity alone as a market fruit.

2. Never select a fruit, for your own planting and use, because it is showy or of very large size. Such, as a rule, are undesirable, if not worthless.

3. If your grounds are limited, it will be found better to plant the earlier fruits, and depend upon the markets for the long keepers.

4. Whatever you plant, you can be sure, at the fairs, to find the most successful cultivators who are sure to be able to tell you how best to manage to secure such results as you will find illustrated upon the exhibition tables.

TWO VALUABLE CHERRIES.

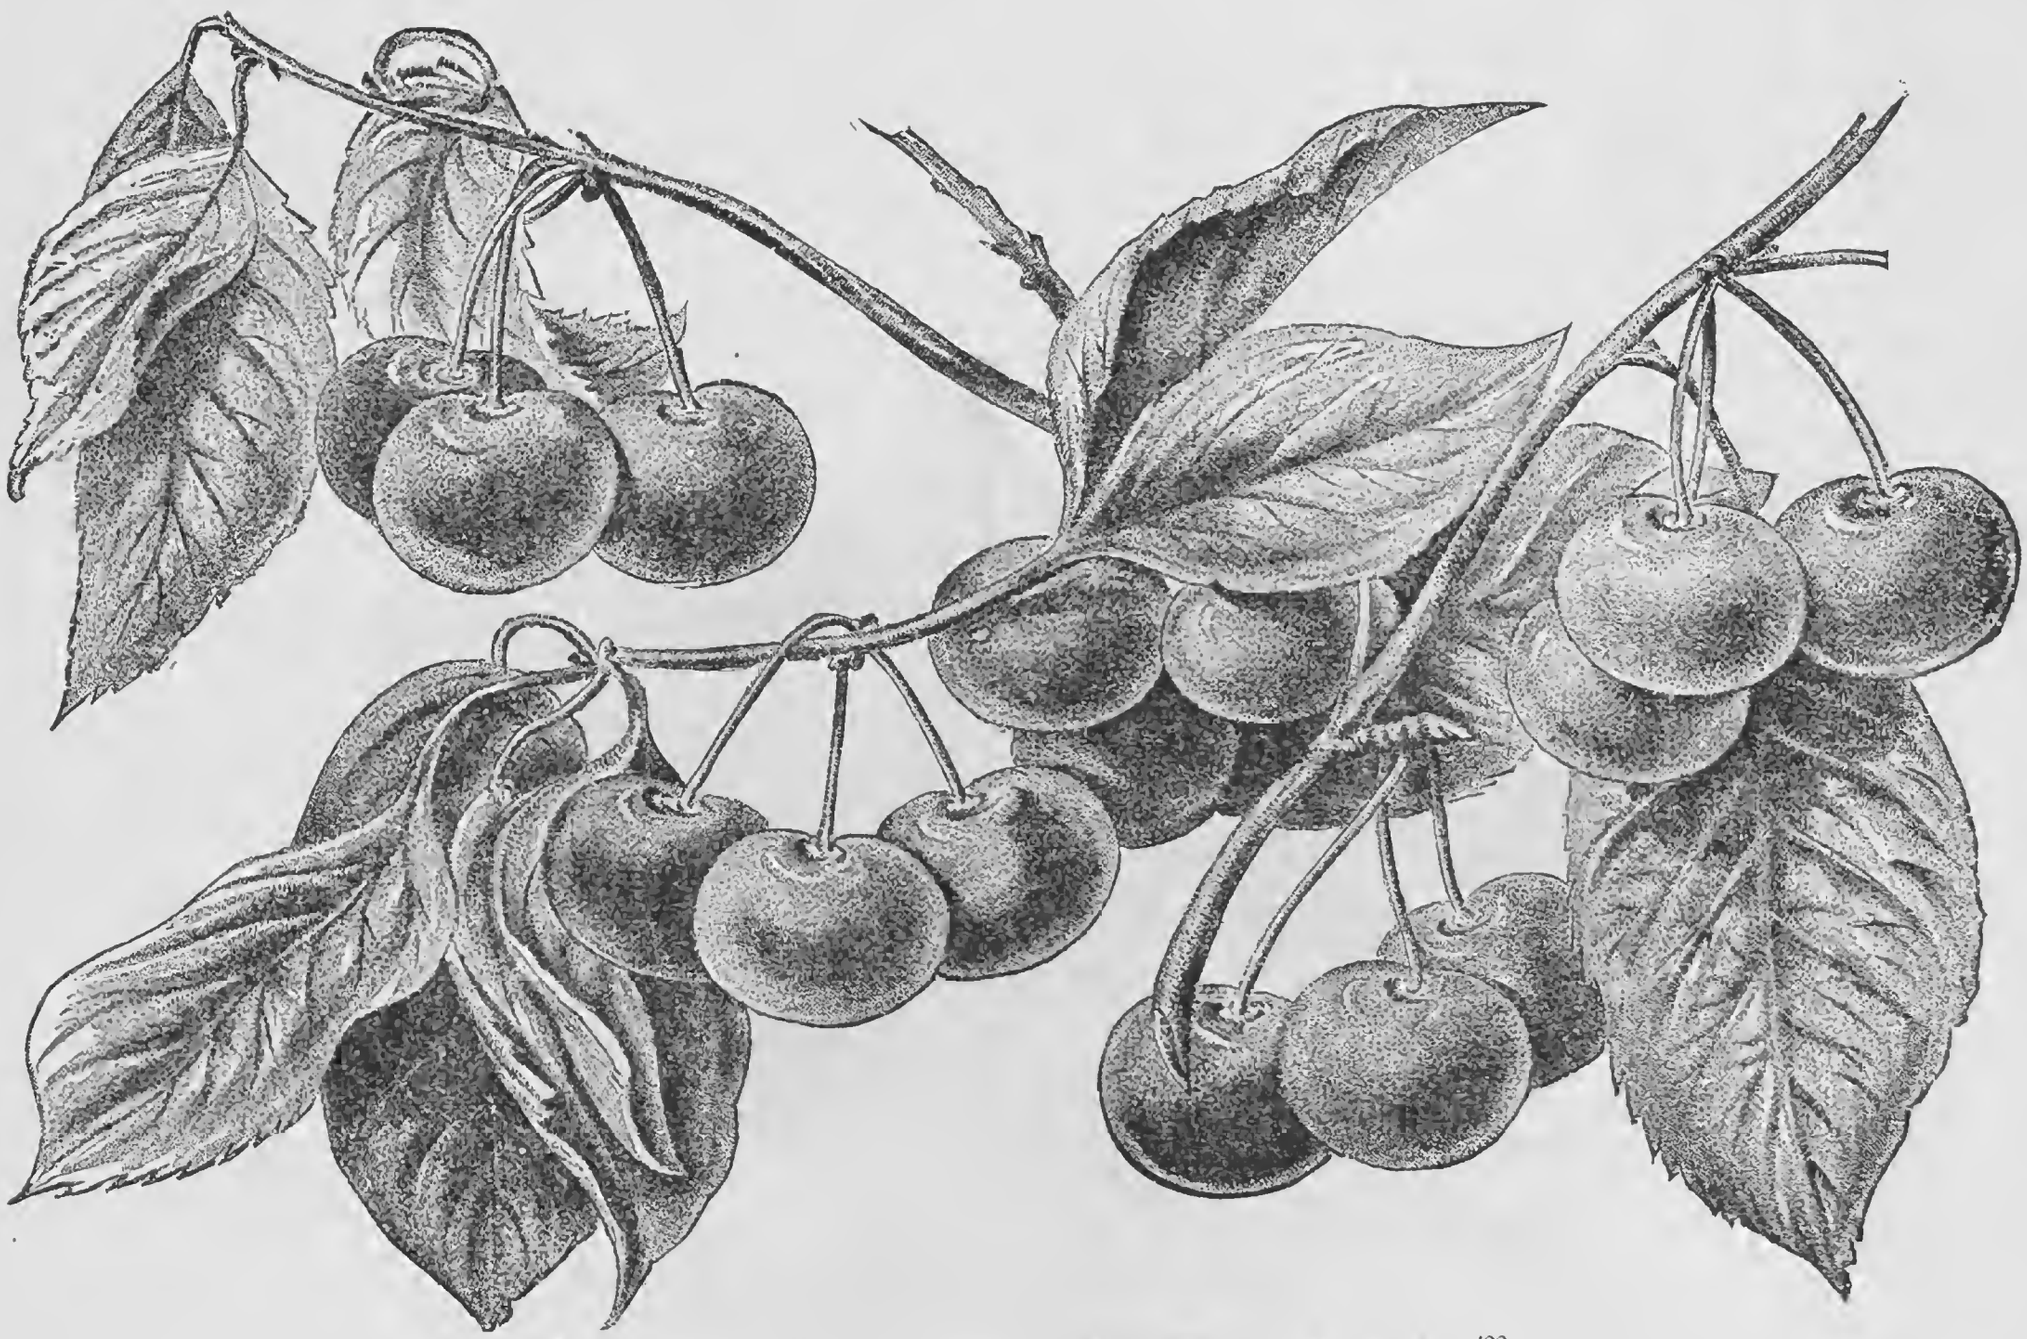
W. C. BARRY.

MOST people consider the so-called sour cherries too acid for dessert or table use, and, although their sprightly, refreshing qualities are enjoyed by some, the number of persons who value such fruit for table use is comparatively small. Among the Duke and Morello varieties there are a few large, fine-flavored sorts, but unfortunately they are mostly shy bearers. This being the case, it is gratifying to be able to draw attention to two Morello cherries which, besides possessing the valuable qualities peculiar to the class, have such fine flavor as to render them suitable for dessert purposes.

The kinds I refer to are Montmorency Ordinaire and Montmorency Large-Fruited. Both were received from France a few years ago, and, after having been tried in the experimental orchards of Ellwanger & Barry, proved to be of high merit. They have also been tested in Illinois, Kansas and New Jersey and have been found to be equally desirable at the East and West. Even where the sweet cherries can be grown successfully they are much esteemed, and people who enjoy acidulous fruits consider them more palatable than the Hearts and Bigarreaus.

Montmorency Ordinaire is of medium size, and of a beautiful light-red color; flesh juicy, melting, with just enough acidity to be peculiarly refreshing. The tree makes a handsome growth, and is extremely hardy and productive. The fruit ripens about a week after that of the Early Richmond. For cooking and canning it is unexcelled.

Montmorency Large-Fruited is larger, of a darker color, richer and in every way a finer cherry than the above-mentioned; but the fruit is not produced so abundantly, though the tree yields what everyone would call a good crop. It is also very hardy. The accompanying illustration, Fig. 428, enables one to form a correct idea of the size and appearance of the fruit. I have watched these varieties closely since their introduction, and I think orchardists and amateurs will find them worthy of attention.



MONTMORENCY LARGE-FRUITED CHERRY. FROM A PAINTING FROM LIFE.—FIG. 428.

Sheep Husbandry.

THE PROFITS OF A SMALL FLOCK OF SHEEP.

LARGE flocks of sheep or poultry are rarely profitable excepting when the sole attention of the owners is given to them. The greater part of the whole number of the sheep in the country is kept in small flocks, and the profit from these is relatively more than that from the large flocks of hundreds or thousands each. A large flock on the plains returns, on the average, a profit of a dollar per head. A small flock kept on a mixed farm usually returns a profit of three to five dollars per head. It is true, the sheep are of better quality, but that is another advantage of the small flock, for it costs no more to raise a good sheep than a poor one, and, indeed, a pure-bred Merino or a good grade sheep is much hardier than the poorly-bred native sheep. The scope for sheep keeping is large and wide. Sheep may be kept as easily as a flock of fowls and, like them, will live on what would otherwise be wasted; they will glean the stubbles, pick over the rough ground, clean a fallow field, range a wood lot, clear the fence rows and corners of the field, and in the Winter will do well on a few turnips and straw. On this feed they will even fatten and be healthier than if fed on corn. If a farmer will count up the cost of a flock of 10 or 20 sheep, and the profit from a few fat lambs and wethers through the Summer, he can easily see a hundred per cent. income from the investment, leaving the fleeces to pay for the keep. There is no other farm stock more profitable when the size of the flock is judiciously proportioned to the conveniences for keeping them. Crowding is as fatal to sheep as it is to fowls. They must have pure air and clean quarters, and as soon as the flock begins to increase too rapidly it comes to grief at once.

Dr. E. Lewis Sturtevant, of Mass., says "The Rural New-Yorker has the best list of contributors of any paper of its class and is doing a noble work."

Swineherd.

DIFFERENT BREEDS OF PIGS.

COL. F. D. CURTIS.

ALL breeds of pigs have merits. Some of them have quite similar ones. The black and red breeds are the least liable to mange or any skin disorder. This peculiarity fits them for any climate better than the white breeds. They also have more lean meat in proportion to the fat than the white ones. The Essex will keep easier than the Berkshire because they are usually smaller and finer-boned. Both of these breeds will fatten at any age. Red hogs, which are an old family of Berkshires, will grow the largest and are remarkable for breeding and the length of body, which makes them the best breed for bacon, as they also possess the same characteristic of more lean meat than white breeds.

White hogs have the advantage of a more pleasing color—more popular—but they are more liable to get sun-burnt and scabby in the Summer and also in the Winter.

Chester-Whites are the coarsest white breed and will attain to a large size. They have a good coat of wavy hair, which fits them for exposure. They are large breeders and well

adapted to districts where hogs range, and are extensively grown.

Poland-Chinas are spotted black-and-white, and are also specially adapted to sections where corn is cheap and large quantities of pork are produced. They are freer from skin disease or trouble than white breeds and are prolific, of large weight, hardy and, with plenty of feed, rapid growers.

The Yorkshires are divided into several families with English names indicating where they originated. The Large Yorkshires make heavy hogs, with flesh of finer grain than other large breeds. They are quiet in habit, which unfits them for field ranging, and they also have thin hair which is unsuited to exposure. They are compact in form and have less offal than other large hogs. The smaller families of Yorkshires are easy to keep, and fatten at any age, the flesh being tender and fine. They are very docile, with only a small per cent. of offal, as the noses are exceedingly short, the ears small and bones very fine. They, with the Suffolk, are the most refined pigs bred, and reach perfection in the proportion of food and growth, as very little food will keep them fat and ready for slaughter. The flesh is fine and tender with an excess of fat.

Victorias are medium between the small Yorkshires and the large, with more hair and activity, which better fits them to take care of themselves.

Cheshires, another white American breed, are not so chunky as the Yorkshires of which they are a cross. These hogs, for a number of years in some parts of the country, led the Yorkshires in popular favor. Their meat is of fine quality.

Neapolitan hogs are rare in this country. They are black, come from Italy and have little hair, but are compact, with fine flesh and bone, and they have been used in England to improve both the Berkshire and Essex. Our native hogs are crosses of all breeds.

BLACK BEAUTY.

WHOEVER keeps a pig, whether for pleasure or profit, should remember that one of the most important considerations in selecting a breed is contentment. The quiet pig is always a fat pig, and however healthy the pig, and however good its appetite, if it is restless and uneasy it will always be a hard keeper. Look into any pen of fattening pigs and you will always find the restless, squealing pig the poorest of the lot. The restless pig is also a great rooter, and as most Eastern farmers are fruit growers as well, they do not want their orchards torn up and the roots broken and destroyed. The fruit grower has two objects in view in keeping pigs; of these the most important is, the eating of all wormy and prematurely fallen fruit, and the destruction of all insects contained in them; the other is the making of a reasonable profit on the growing and fattening of the pig for market, and to him the quiet, peaceable, non-rooting pig is indispensable.

Pigs of no other breed so entirely and fully meet these requirements as do the Essex. They are very peaceable and quiet; scarcely ever attempt to root; are very fond of a grass and vegetable diet, and on a full supply of fallen fruit and grass they will always be fat and growing and at any time fit for the butcher, whether they are old or young. Their skin is thin, ears small and faces short, and they have a very small proportion of waste when slaughtered. Their flesh is fine-grained, with a large proportion of ham and shoulder. Some may object to their color, but their clean, plum-colored skin covers a healthy carcass and the color is only scurf-deep, for they dress as white as the whitest breeds. They are prolific breeders, and good mothers. In fact there are no amiable traits possessed by the swine family, that are lacking in the Essex.

Black Beauty, whose portrait we give, "is of royal blood." She was farrowed October 20th, 1877; sire, "Young Negro"; he by old "Negro" imported. Dam, "Miss Dinah," granddam, "Hestor" by "Black Prince," imported, by Stockwell; great-grand-dam imported "Queen May." This sow is a perfect beauty with fine limbs and ears, and short face. She has taken first premium wherever shown in Canada or New York. She is one of the quietest sows ever seen, always fat and brings fine stock.

J. S. WOODWARD.

ESSEX HOGS.

Less than half a century ago the native hogs of Essex County, England, were coarse and of no particular character or color. Subsequently Lord Western improved them by direct crossing with the Neapolitan, a small black breed, imported from the Peninsula of Italy. Fisher Hobbs, of Essex, afterwards continued the breeding of these cross-bred pigs and established the breed of "Improved Essex." Importations of these pigs were made to America, from which the Essex hogs of this country have descended. They are not numerous, as they are overshadowed by the Berkshires which they closely resemble, and to which they are closely related, as both breeds have been improved by crossing with the Neapolitan. Unlike the Berkshires, the Essex are pure black in color, but both sorts are quite similar in the quality of their flesh. They are finer in the bone and smaller in size. They have the same tendency to lean meat; will fatten at any age, and are very easy keepers. They are excellent to cross on coarser breeds, such crosses making grades profitable to fatten.

F. D. C.

Horseman.

THE CLYDESDALE HORSE.

THE origin of this noble breed of horses is not definitely established, but the fact that for more than 200 years it has been favorably known and highly prized along the valley of the Clyde, in Scotland, is well understood. Tradition asserts that more than two centuries ago one of the Dukes of Hamilton brought to his estate in Lanarkshire, Scotland, from Flanders, six fine black stallions, which were kept at Stratharen Castle. The enterprising and sagacious Scotch tenants and farmers of that district readily saw the rare opportunity within their reach, and improved it. By selecting and crossing their best native mares with these large, fine stallions, a class or family of horses was produced far superior to their ancestors.

About 1715 or 1720 one John Patterson went to England and brought to Scotland a Flemish stallion, and from this date the Clydesdale breed of horses has a distinct history. The introduction of this horse into Scotland seems to have had almost as marked an effect upon the draft horses of that country as the importation of the renowned Messenger did upon the road horses of America. Each of these noted horses proved a source of immense wealth to the country of his adoption. In the descendants of the Patterson horse we find mention of the same marks and characteristics which are indications of purity of blood in the Clydesdale breed of to-day; viz., a white mark in the face, white feet, gray hair in the tail and frequently gray hair on the body.

It may not be extravagant to say that for 200 years there is no one subject that has so completely occupied the attention of the Scotch farmer, in which he has taken such a deep interest as in the improvement of this favorite breed of horses. He never fails to see that his horse has the best of care and attention, and although usually taught to work when two to three years of age, thus developing his muscle with his growth, it is done with such care and judgment that he is very seldom injured. So intimately associated are the master and his horse that they seem to have inherited similar qualities and characteristics—one being as decidedly Scotch as the other.

For many generations these horses have been bred with unusual care, depending, not so much upon carefully studied pedigrees, as upon the selection of perfect specimens for both sire and dam, tracing to those families of ancestors which have been the great prize-winners, not only of Scotland but of the United Kingdom. They have also been reared in the great ship-building districts of the Clyde where immense loads are constantly being hauled, and where only horses of unusual power can do the work required.

The Rev. David Ure, in 1792, in writing concerning this breed of horses and the care exercised by the Scotch breeders, says: "They pay strict attention to every circumstance respecting the color, the softness and hardness of the hair, the length of the body, breast and shoulders of the breeders, both sire and dam. No inducement whatever can lead them to encourage the breed of a horse that is not possessed of the best qualities." It has been by careful breeding, by judicious selections, by good feeding, by intelligent, watchful care in every detail for centuries that the Scotch people have produced a breed of draft horses that has scarcely an equal, and which has been a source of national wealth and an object of national pride.

The course pursued by the various agricultural societies and stock fairs of Scotland has done much to encourage the improvement of draft horses in that country. For at least the last hundred years the exhibition of draft horses has been one of the prominent features of all such shows which are held in almost every district of Scotland. The Highland Agricultural Society has become one of the notable institutions of the country, and to win the first prize, or challenge cup, offered by this society for the best draft horses, corresponds to winning the "Derby" in England or making the best record on the trotting course of America.

The ideal Clydesdale is the one combining the greatest number of strong points, with no weak ones; the one that has the least waste material and the best style and action. He should be low and stocky, with a pleasant countenance; a mild, cheerful eye; a broad, deep chest; good shoulders; short, broad back well coupled; a long, broad rump; heavy stifles and round in the barrel. His limbs, which are of the utmost importance, should be short, broad, flat, hard and cordy, and with plenty of silky hair from the knee and gambrel to the hoof—this being considered an indication of superior quality of bone and good breeding. It also affords a protection to the limbs in inclement, changeable weather and a shield against chafes and bruises while at work. The feet should be solid, of good size, deep and broader than on a road horse, but not flat.

The disposition of these horses is one of their most valuable characteristics. They are almost always kind, gentle and true; never fractious, seldom fretful, but free, cheerful and seeming to work almost from instinct. Usually but a single day is required, when a colt is taken from the pasture, to break him to the harness so that he can be driven with safety, and be put to almost any work. The value of such a disposition in a business horse is seldom fully appreciated. The constantly increasing demands for these horses and the high prices which they command, denote the estimation in which they are held by those most familiar with their good qualities. They are exported to almost every civilized country on the globe, and it may be said that the demand far exceeds the supply.

It is only a few years since this breed of horses has been generally known and introduced into this country; but they seem to be received with almost universal favor. Importers find it impossible to procure a sufficient supply in Scotland to meet the demand. There is a call for them from almost every State and Territory. Until recently we have had, *strictly speaking*, no breed of draft horses in this country. Our marvelous success in developing the "American Trotter" has caused us to run wild over the development of speed, greatly to the detriment of our agricultural and business interests. We have bred for speed until our horses have become so reduced in size as to be almost worthless excepting for light weight upon the road, and for that purpose the supply far exceeds the demand. How often do we see farmers merely skimming over the soil, doing half a day's work in a day, obtaining only half a crop merely because their horses are too light and too delicate to perform the labor required.

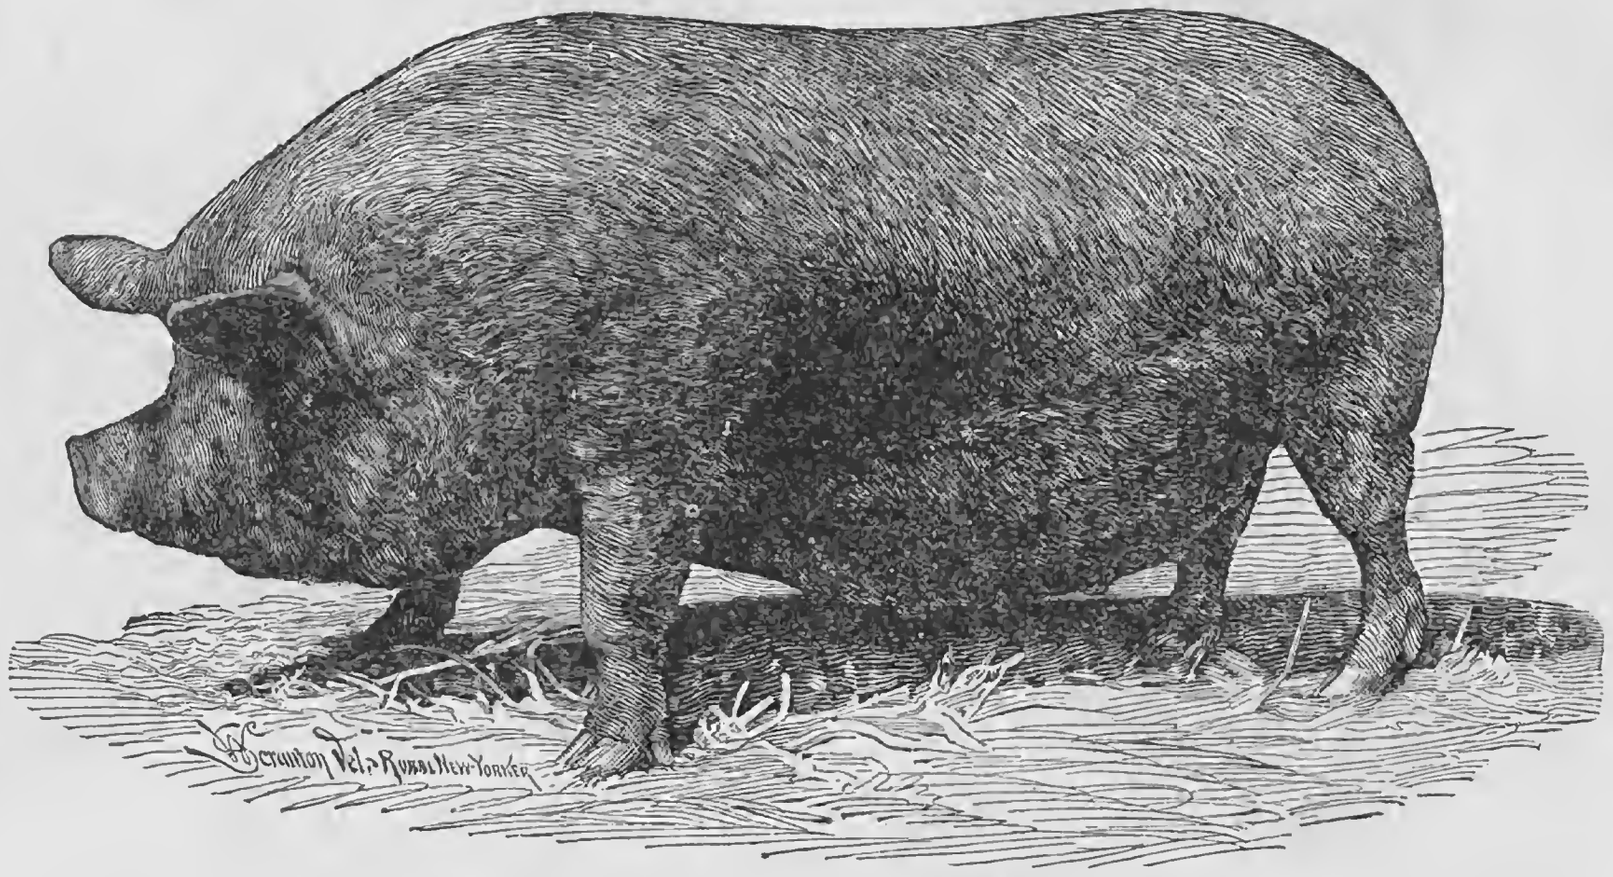
We fully understand and appreciate the fascination, the pleasure and enthusiasm connected with breeding fast horses. We cannot, we would not, dispense with the "American Trotter." The people and the times demand speed—fast trains, fast mails, fast roadsters; but let us not neglect business for pleasure.

We have carried such breeding to too great an extent, greatly to the detriment of the business interests and the wealth of our country. The interests of both agriculture and commerce require an improvement in our general business and draft horses. Every business-man knows how difficult it is to procure a good draft team, a span of horses weighing, 2,800 to 3,200, pounds that can with ease draw a load of three to four tons. The Western States are far in advance of the Eastern in this respect. With a keen eye to the profits of breeding what the public demands, they have at immense cost introduced large numbers of draft stallions to cross on their native mares. It has been a success, and the value of the horses of many sections has thus been at least doubled. The Eastern States should profit by their example and experience. A change must be made before the breeding of horses in the Eastern States will be generally profitable. A few skillful breeders are meeting with marked success in rearing light horses for speed; but a large majority of our farmers find it decidedly unprofitable. To effect the change, no method is so practical and so economical as the introduction of superior draft stallions, and probably no breed is better calculated to cross upon our Eastern, light-boned, spirited dams, than the Clydesdale. The produce is a horse of large size, fine style, excellent carriage, with good head, fine neck, long in the body, round in the barrel, with broad, flat, cordy limbs and good feet. He is a good roadster and adapted to the farm, express, coach, coupe, omnibus; and many of them are superior for the carriage, while all are decidedly business horses, and will command good prices and ready sale.

From large dams the first cross will usually produce horses suitable for the heaviest draft; while almost invariably the second cross will produce such a result. The prevailing color, both in the pure bloods and their crosses, is bay or brown, which is a matter of great importance in business horses. Animals of these colors are durable, always popular, always salable and require less care than any other.

So important did the Highland Agricultural Society of Scotland consider the matter of color that at one time, when they found the grays becoming too prevalent, they made a rule that all horses entered for competition should be either 'black bays or brown bays." Such horses have at all times a ready sale at high figures and pay a handsome profit to the breeder. They require but little attention and care, and are seldom blemished. At three years of age they can, without injury, be put to regular farm work, and at four years to the heaviest labor. They cause no loss of time in breaking and fitting, which usually consumes what otherwise might be profit, in breeding other classes of horses.

The Clydesdale Association of America, an organization composed of the leading importers and breeders of the Clydesdales in this country, is now preparing and will soon pub



BLACK BEAUTY.—FROM LIFE.—FIG. 429.

lish the first American Clydesdale Stud Book which, we think, will be of general interest to the public and of great value to all breeders of draft horses.

The Brown Glancer, No. 1322—Scotch Stud-Book.

This elegant, pure-bred Clydesdale stallion is the property of Messrs. Smiths and Powell, of Syracuse, N. Y., by whom he was imported in October last. He is a bright dapple brown; stands 17 hands high and weighs nearly 1,900 pounds. He was sired by What's Wanted, (913); he by Young Lord Haddo (993); he by Lord Haddo (486); he by Old Clyde (574); he by Scotsman (754). Dam Young Jean, by Brown Glancer (115); he by Strathendrick Tam (823); he by John Anderson My Jo (409); he by Byron (102); he by Clydesdale Jack (172); he by Glancer II (337). What's Wanted's dam, Jess, by Old Clyde (574). Young Lord Haddo's dam, Sally, by Undy Star (888). Brown Glancer's dam, Brisk, by Thane of Fife (854). It will be seen that he is a horse of rare breeding. He is powerfully made, a horse of elegant muscle, with very superior bone, fine finish, and with unusual style and remarkable action. The engraving of Brown Glancer in this issue, was made expressly for the RURAL NEW-YORKER,

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

Smut in Wheat, etc., etc.

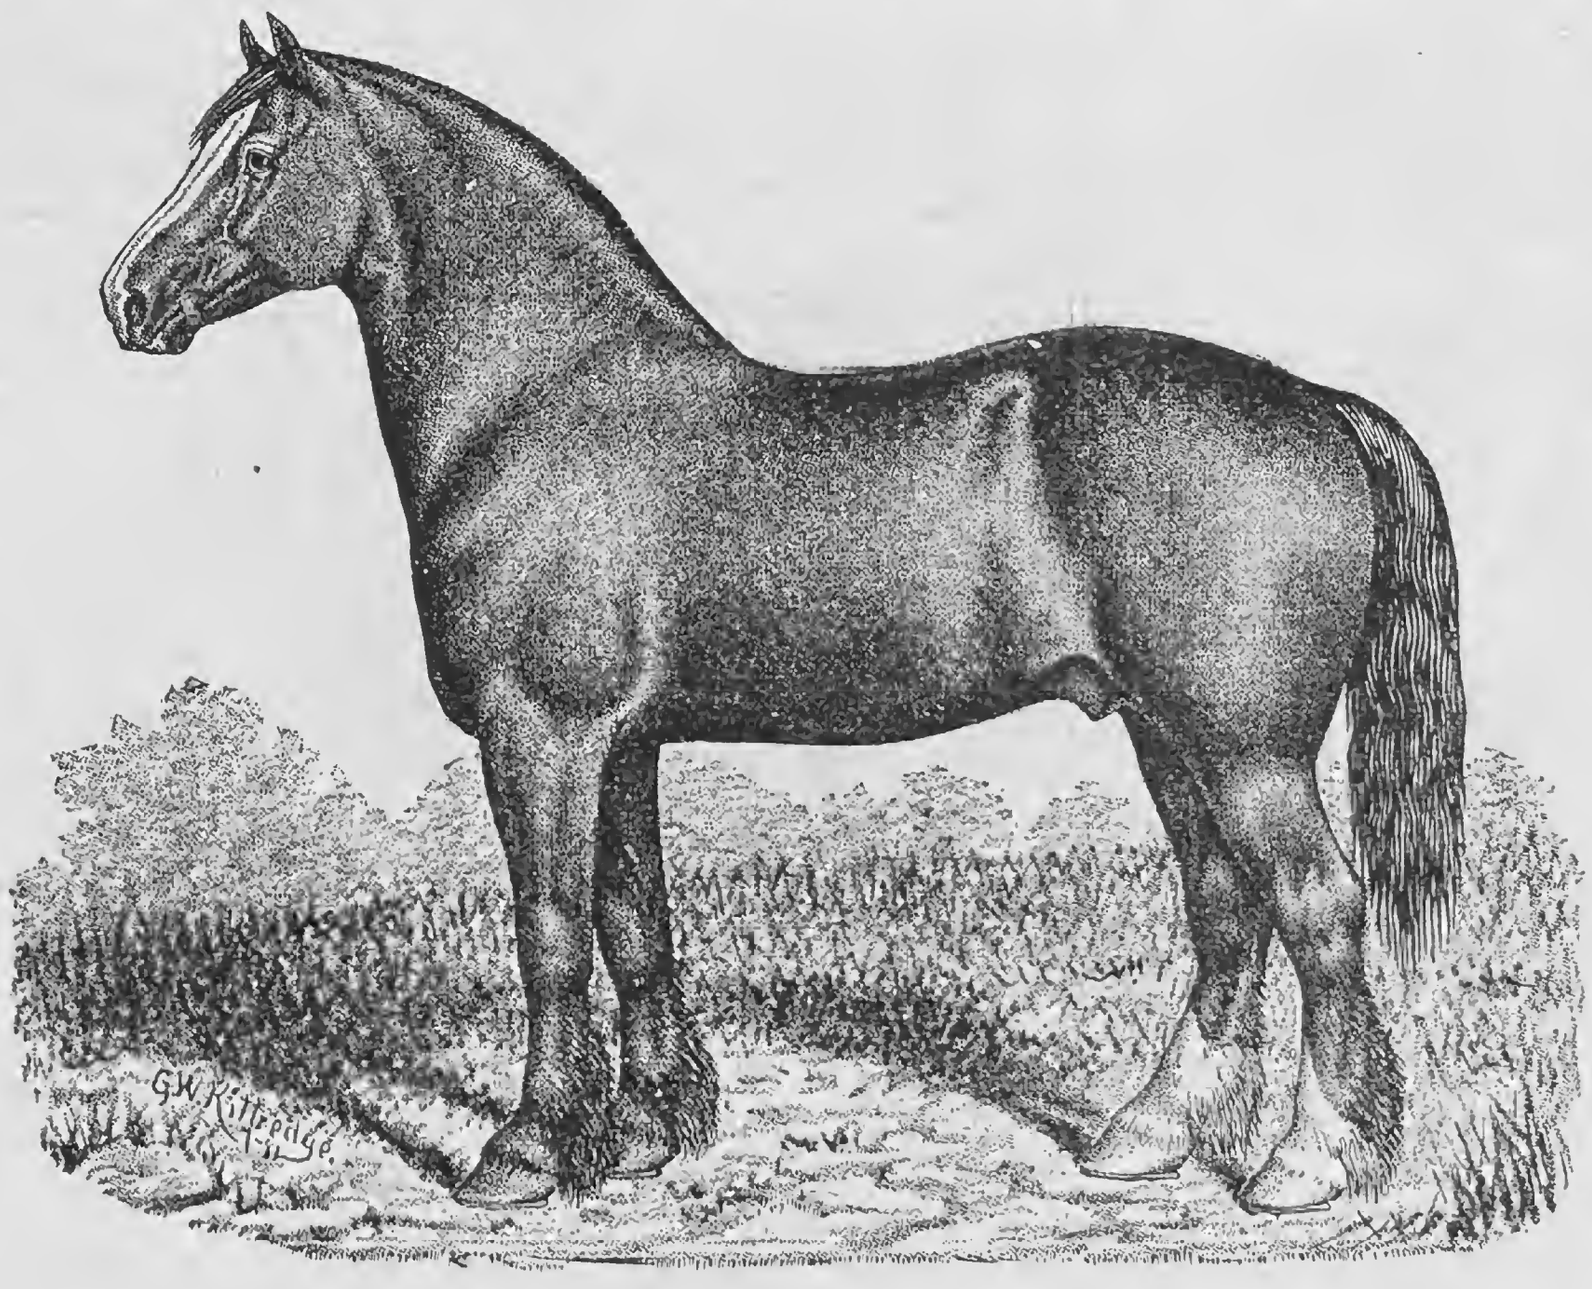
J. G. E., Hood River, Oregon, asks, 1, what causes wheat smut; 2, will "vitrioling" the seed prevent smut, and, if so, why. There, certainly, is no vitality in a grain of smut, he thinks; nor can there be, according to his opinion, any means of transmitting smut that might be on the seed to the head it produces. 3. What grass would be best to choke out fern on a loose, basaltic or granitic soil? 4. Will feeding barley to sheep in Winter cause them to shed their wool in the Spring? 5, Where can Tartarian Buckwheat be obtained for seed?

ANS.—1, Smut consists of the seed spores or fruit of a parasitic fungoid vegetable. These spores are so small that eight millions of them occupy no more than a square inch of surface. Every ear of smutty wheat will probably disperse into the air ten millions of these spores. The enormous number of these seeds—each one of which is ready to reproduce itself millions of times in one growing season—that are floating about in the atmosphere, or are lodged upon the soil, or upon the grains of seed wheat, would therefore make it a very simple matter for a crop of wheat to be affected by smut. These small spores are true seeds, and if moistened and kept warm they can be seen to germinate and produce fruit, under a powerful microscope. 2. There certainly is vitality in a grain of smut, but this is destroyed by several corrosive chemical substances which dissolve and destroy the spores. One of these substances is sulphate of copper or blue vitriol. But there *is* a means of transmitting smut that may be upon the seed to the head it produces, and it is in this way: these very minute spores are small enough to enter the feeding root hairs of the plant and be carried in the circulating sap into any part of it. At least the tissue of the sap may become infested with the fungus whose fine, thread-like mycelium can penetrate through and among the cells, so that "vitrioling" the seed may and will save the plant from any spores that may exist upon the seed and the plant may then have a great chance to escape other infection. 3. Clover would be the best "grass" crop for this purpose. But it would be preferable to clear the soil of the ferns before seeding to grass or clover by thorough plowing and harrowing out the fern roots and sowing buckwheat. 4. Any grain food that is heating in its effect on the blood will cause the shedding of wool. But this trouble is more often due to irritation of the skin from overheating and too great warmth in the Winter, than from any food, unless it is given in excessive quantities. 5. There is no Tartarian Buckwheat in this country so far as we know. A poor variety known as Merino Buckwheat or Indian Wheat sometimes goes under this name, but it belongs to Central Europe, or at least it is grown there upon very poor lands. There are no better kinds of this grain in existence than the common gray and the silver-hulled varieties.

Flax-Seed and Oil-Cake Meal.

T. M. T., Altoona, Ia., asks what is the relative value for feeding purposes of flax-seed and oil-cake meal; 2, would it pay to feed oil-cake meal to dairy cows on pasture at this time, for milk and butter.

ANS.—By the German standard flax-seed is estimated to be worth, as stock feed, $2.47 per 100 pounds, and oil-cake meal $1.61 per 100 pounds. Circumstances, however, might render a certain sum expended for one more beneficial than the same sum spent for the other. For instance, a calf six months old would be more benefited by $5 worth of oil-cake meal than by $5 worth of flax-seed meal, because the former contains a larger proportion of albuminoids and phosphate of lime needed to produce muscle and bone, to enlarge the frame. On the other hand, boiled flax-seed fed with skimmed milk to younger calves fully replaces the cream taken off the milk, and therefore it is more appropriate than oil-meal for calves fed chiefly on milk. Skimmed milk and one pound of boiled flax-seed per day will add greatly to the weight of calves two or three months old and under. Corn, oats and flax-seed ground together, in the proportion of seven and a half bushels each of corn and oats and one bushel of flax-seed would make an excellent mixture for dairy cows, especially in Winter, when the slight excess of oil in it over ordinary food will keep the stomach in good order at a time when so much dry, husky food is consumed. 2, Yes; a ration of a couple of pounds a day would pay well fed to milch cows at pasture.



THE CLYDESDALE STALLION, BROWN GLANCER. FROM LIFE. FIG. 430.

Grass for Wet Fields.

C. N. G., Cairo, N. Y., wishing to seed to grass a field which is wet in Winter and Spring and on which, therefore, it is hard to get a good "catch," as the grass is apt to get frozen out, asks whether Quack Grass or Orchard Grass would be likely to do well on it; and whether it is well to sow any other grass seed or grain with whichever of these may be put in.

ANS—We do not know that Quack Grass seed is offered for sale. Few would sow it on their farms. There is no valuable grass that will thrive well on "wet fields." We would suggest Red-top. Fowl Meadow Grass and Creeping Bent Grass may be mixed with it to advantage. The land might be prepared now and grass seed sown with wheat.—one and a-half bushel per acre. Of course, either grass or grain would do better if sown separately. We are here growing more and more in favor of sowing clover and all kinds of grass very early in the Spring. If sown with wheat, use an inclined-tooth harrow to harrow in. Except for shaded fields, we prefer Timothy or Red-top to Orchard Grass.

Cough in a Horse.

L. R., Lodi, N. Y., asks for a remedy for a three-year-old mare troubled with a bad cough for the last couple of months; there is no discharge from the nostrils, and her condition and appetite are good, except that the glands at the top of the throat are a trifle thick.

ANS.—Give sloppy food and hay well dampened with salt and water. The irritation at the top of the wind-pipe will be much relieved by causing the mare to frequently inhale the vapor from hot water, which may be done in one of the ways lately illustrated in this department, or as good a way as any is to hold her head over a bucket of hot water now and then stirred up by means of a wisp of hay immersed in it. Should the weather prove cold as it lately has, the mare should be blanketed. Apply some stimulating liniment now and then between the jaws and a short distance down the back.

Period of Gestation in Sheep.

W. H., Watertown, N. Y., asks how long is it until lambs are dropped after the sheep is put to the ram, on an average.

ANS.—There is some difference in the period according to the breed; thus Darwin says that kept under the same conditions, Merinos and South Downs differ thus:—Merinos average 150.3 days; South Downs, 144.2 days; half-blood Merino and South Down average 146.3 days; three-fourths South Down blood average 145.5 days. Among 912 ewes M. Tessier found that 140 lambed from the 146th to the 150th day—average, 148 days; 676 between the 150th and the 154th days—average 152 days; 96 lambed between the 154th and the 161st days—average—157 days. Thus the shortest period was 146 days, and the longest 161 days, with this flock, whose breed is not mentioned.

Miscellaneous.

R. M. L., Bedford, Ia., asks for a remedy for grease heels in horses.

ANS.—Keep the feet clean, and for a couple of days apply poultices of equal parts of bran, flaxseed meal and powdered charcoal. Remove all secretions of dry matter and dry scabs and crusts, and then apply, two or three times a day, some oxide of zinc ointment, to be had at the druggist's. Give loosening food, mixed with two drachms of nitrate of potash, mornings and evenings.

R. H. M., Antelope, Kan., asks, 1, how old should a bull be before allowed to serve cows; 2, how many should he serve in a season.

ANS.—1, A bull should be a year old before he is used for service; 2, The number depends a great deal on the age of the bull. When one year old, 10 would be enough; when a year and a half, 20 or even 25 would not be too many; when two years old and over, he should not serve over 50 or 60.

Miscellaneous.

SUCCESS WITH RURAL FREE SEED DISTRIBUTION.

WE have enjoyed our first crop of Cuthbert Raspberries from the plants sent us by the RURAL, and we find them, like others of the RURAL presents, a valuable acquisition. They seem to be perfectly hardy with us; for although standing unprotected in an exposed part of the yard, their growth was unchecked by last Winter's severe cold. We were already growing several varieties of raspberries, but the present prospect is that the Cuthbert will outrank them all. Perhaps I ought to except the Caroline which is a prime favorite with us. We were also greatly pleased with the Laurel-leaved Willows that you sent us last year. They made a wonderful growth; one of the cuttings attained a length of more than seven feet during the Summer, and its rich, glossy foliage was the admiration of every beholder. Being anxious to increase their number so that we may have a supply to set in various places on our premises, we cut the entire growth off, leaving only bare canes, which, by the way, are this Summer growing into finely shaped little trees. The trimmings were all carefully cut into pieces and set in the ground along with grape cuttings and other experiments. Every one of them grew so that now we have an abundant supply for ourselves and perhaps some to spare for friends who will appreciate them. E. K. B.

Sterling Sta., N. Y.

WE copy the following from our Fair Edition of last year: "Of all the wheats we tested last season, 'Fultzo-Clawson' bore the largest, heaviest kernel, though it did not yield as much as many others. We often distrust the reputed parentage of so-called 'hybrid' plants. We are satisfied that the parentage of many new sorts of potatoes is merely guessed at, owing, as we said before, to the extreme difficulty of procuring pollen from the anthers of the flowers. But the Fultzo-Clawson shows a marked likeness to both parents. We hope under continued cultivation it may prove as prolific as the kernels are heavy." This year it ranks in yield among the highest of our 77 different kinds.

THE RURAL DIANTHUS.—I have received from my garden in Madrid, St. Lawrence County, New York, a beautiful blossom from the choice dianthus seeds distributed by the RURAL last Spring, together with the information that there is great promise of many more. I ought to add that circumstances prevented as early and careful a planting as we desired, but the result is quite beyond our expectations and very satisfactory. P. H. W.

Dr. T. H. Hoskins says that the Rural New-Yorker is the best agricultural and domestic paper in the world.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, Sept. 3, 1881.

OUR CLUB OFFERS FOR 1881-82.

THE RURAL NEW-YORKER has never until last year clubbed with any other journals. We have, however, for 1881-82, for the benefit of many of our readers, been at great pains to procure the lowest cash rates for the journals mentioned below, so that any of them with the RURAL NEW-YORKER may be subscribed for at very much lower rates than the two separately:

The Inter-Ocean and RURAL NEW-YORKER	$2.75
Detroit Free Press " "	3.00
Weekly World " "	2.75

Any person ordering for one year the RURAL NEW-YORKER and any one of the above Weeklies will receive the Plant and Seed Distribution without application and without charge for postage. All subscriptions for the above journals are promised prompt and careful attention.

THE WHEAT SPECIAL number of the RURAL NEW-YORKER will be next.

PROF BLOUNT (Colorado), in a recent letter, states that he raised Black-bearded Centennial, both as a Winter and a Spring wheat, and finds it succeeds best as a Spring wheat.

THE LONGEST HEAD of wheat raised at the Rural Farm measures precisely eight and one-quarter inches. In due time we hope this kind of wheat will prove worthy of a place in the RURAL'S Distributions.

IN ALL SEEDSMEN'S catalogue descriptions of wheats, it should be stated how many grains there are to a breast or spikelet. Whether the spikelet contains two or three grains, all else being equal, makes a difference of one-third in the yield.

WHEN THE wheat plant is said to be "in bloom," it is really past its bloom, the seed having begun to form. As the anthers shed their pollen or fertilizing dust *before* they appear outside of the chaff or envelopes, it must appear that the widespread belief that rains occurring when wheat is in bloom cause barren heads, is quite erroneous.

PROF. BLOUNT expresses himself in another column that salt applied at a certain time to wheat will prevent rust. The air at the Rural Farm is so impregnated with salt that during cloudy or foggy weather the salty taste is very preceptible upon the lips, and must, of course, impregnate the soil. Nevertheless, of our 77 different kinds of wheat there was not one the leaves of which were not more or less rusted.

THE VALUE AND NUMBER of the gifts which will be presented to those who raise the best crops from the wheat and corn of the present Free Plant and Seed Distribution of the RURAL NEW-YORKER mark a decided deviation from the usual course of agricultural journalism. No doubt it will lead to a settlement of the questions as to whether it is profitable to cultivate wheat and whether flat cultivation of corn—the seed planted in drills—is preferable to the old methods.

MR. J. H. REALL, the secretary of the American Agricultural Association, after a visit to the Rural Farm last July, writes as follows: "My visit to your farm yesterday was a most instructive one, and I do not know where a man could go in this country to get more valuable information on general agriculture. I feel you are doing a great and good work, and its results must be of vast benefit to the whole country. I hope your health will be spared until your fondest hopes are realized in the work you seem to have so much at heart."

IT IS IMMATERIAL to us whether those desiring to avail themselves of the very low rates for the RURAL NEW-YORKER in connection with the other journals elsewhere announced, subscribe through us or them. The rates in either case are the same. We may say, however, that we have made all the necessary arrangements to transact the business promptly and accurately in so far as our part of the transaction is concerned.

MOST FARMERS are careful to shell off the butts and tips of seed corn. They should be just as careful, in the selection of seed wheat, to reject all but the outer seeds of every spikelet, and to cut off the "tip" and "butt," so to speak, of the wheat ear. Those flowers just about the middle of the ear or a little above are the first to bloom and the first to ripen. For a large quantity of seed, of course, any such manipulation would be out of the question. But the RURAL advocates SEED PLOTS for wheat as for corn.

THE CENTRAL PICTURE of the cover is drawn from a photograph of a view in the Rural Ex. Grounds, showing the front of the dwelling and some of the shrubs and trees about. The tree on the left is the beautiful Yellow-wood (Cladrastis tinctoria), planted seven years ago, and one of the most beautiful and in every way satisfactory ornamental trees in cultivation. That on the right, though not distinctly enough shown to be indentified as such, is the Maiden-hair Tree (Salisburia adiantifolia), while between are specimen shrubs of various kinds.

THE FOLLOWING is the most remarkable yield from a single potato we have ever heard of. It comes to us from Mr. W. A. Sanders, the well-known horticulturist, of Sanders, Fresno Co., California, under date of Aug. 1st: "My White Elephant Potato, received from the RURAL NEW-YORKER office, has yielded 130 pounds of the finest potatoes you ever saw—some of them over two pounds in weight. I shall plant the whole of them next week, and shall have by November 25th, two and a half tons of potatoes from the single tuber received in April.

WE ARE INFORMED by one who speaks from his own knowledge and who has no motive for misrepresenting the matter, that certain potato growers around Norfolk, Va., are now sending North for small potatoes (cullings) which they plant at once. These are bought for a dollar or less per barrel. The crop is dug as soon as frost kills the vines, and these half-matured potatoes are kept until February or March and then planted. Now this gentleman assures us that the crop grown in this way is *double* that grown from matured potatoes in the usual way. We merely present the statement as it comes to us.

THE NEW STRAWBERRY, Jersey Queen, illustrated on page 580, has not been tested at the Rural Grounds, and we should hesitate to commend it to our readers, except for trial. It is one of Mr. Durand's seedlings, and most of these, experience has taught us, do not thrive under those ordinary conditions which fit them for general cultivation. We are assured, however, by a friend who, during the past season, saw the vines in fruit at Mr. Durand's, that he never saw more uniformly large berries or vines so laden with fruit. For the rest, we commend the remarks of our well-known contributor, Peter B. Mead.

FOR THE PAST FOUR YEARS we have been endeavoring to establish a new variety of tomato, the peculiarity of which rests in its being half golden and half bright crimson. But this peculiar and pretty marking seems hard to fix, though from year to year we find that there is an increased percentage of those so marked. A golden tomato is a beautiful object—a crimson tomato is beautiful too. The two colors distinctly shown in one, however, would no doubt prove a pleasing acquisition provided the tomato in quality were equal to the best of the well-known kinds of this wholesome fruit. In making our selections for seed, all of the tomatoes so marked are placed together and the seed raised only from the one which is the *last to decay*. Keeping quality, now that we have perfection in form, is the improvement most needed in tomatoes.

IF WE were to suppose that seed-wheat yields but 30-fold, one bushel of seed should produce 30 bushels of crop. But every seed produces more than one head, and every head will produce at the least estimate 25 grains. When therefore two or three bushels of seed are sown, we may see what an immense waste there is. Nevertheless, in all seed-sowing a heavy allowance must be made for waste. For the crop of this season we sowed all the way from half a bushel to three bushels and a-half, and our general impression is that from one bushel and a-half to one bushel and three-quarters for the Rural Farm produces as good a yield as any other quantity—larger or smaller. This, however, is no safe guide for other farms. Each farmer, guided by the productiveness of his soil, its preparation and the crop previously sown, must judge of the quantity of seed to be sown to the acre, for himself. As a rule, it may be said that the richer the soil and the better it is prepared, the less seed will serve.

SILVER CHAFF WHEAT.

WE have spoken both well and disparagingly of Silver Chaff Wheat. We have now again to speak in its favor. Our own field of about five acres has yielded better than Clawson ever did upon our farm; while a neighbor on a trial plot of about half an acre of richer land has raised, at the least estimate, 35 bushels per acre. The wheat averaged five feet in hight, the heads four inches in length, while many heads were over five inches. The spikelets averaged nearly three kernels. It stood the past Winter remarkably well, making a fine stand where, in adjoining fields, Clawson was injured. From all that we have heard, Silver Chaff is not so well adapted to a wide range of territory as Fultz or Clawson; but upon land suited to it, it is capable, we are confident, of yielding heavier than either, while we are told it makes a quality of flour superior to that from either.

DURABILITY OF ENSILAGE.

FROM AN artiele recently published by Dr. Werner, a leading authority on the subject of fodders, it appears that ensilage has been kept for a term of six years in a state of excellent preservation, at the farm of the agricultural school at Altenburg in Hungary. Cattle ate the product readily, in spite of its age. It had been prepared from fodder-corn according to the common Hungarian method, that is to say, the corn was allowed to wilt somewhat, after mowing, and was then trodden firmly into great trenches six or seven feet deep by twelve feet, or more, wide, and of any desired length. When the trench has been filled to the brim, the fodder is piled up, above ground, crowning like a roof, often to a hight of nine or ten feet. The heap is then covered with earth, and when the fermentation has gone far enough so that the mass sinks upon itself, pains are then taken to fill up or beat together, as often as may be necessary, any cracks that may form in the covering of earth. Werner remarks that the upper layers of this ensilage had the color and the agreeable odor of brown-hay (Braunheu), while the lower layers exhibited the characters of sour-fodder more and more clearly the deeper they were. This capital observation on the durability of ensilage is all the more interesting for us Americans since the Hungarian climate, with its hot Summers, is in some respects not unlike our own.

THE FARMER'S OPPORTUNITY.

WITH THE Fair season comes another opportunity for the farmers to select a good agricultural journal for their special study. Things have changed during a few years past. A few hundred years ago the people who made the most noise in the world, the warriors and soldiers and others of that class who considered themselves essentially the "first families" of their countries, scorned the gentle arts of reading and writing as beneath their notice. The power of the pen to form opinion, to lead thought, and to instruct, is greater in the arts of peace than in politics and war. Especially, in these days, is the agricultural journal a vast influence for good. Since it has become common and influential, the art and science of agriculture have made the most wonderful advances. The food and clothing supplies of the world have vastly increased, and have made possible the happy existence of millions that would otherwise have never been born. For abundance of food creates comfort and wealth, and renders subsistence easy for vastly increased numbers. The present enormous immigration of 600,000 persons, with untold millions of property, into this country, the present year, is an outgrowth of our present agricultural prosperity made possible by agricultural journals. For these have advocated, explained and encourged the use of improved methods, better stock, more valuable seeds and crops; and, above all, have educated the farmers, and have created within them the ambition to excel in their art. And yet, a few years ago, the farmer who read an agricultural paper was scornfully termed a "book-farmer." But a wonderful change has come in this respect, and the farmer, who, like those fierce, ignorant old knights of old, gloried in his aversion to reading, has become not only a reader, but a writer, and is telling of what he knows to other interested and eager farmers. Now the first paper that the farmer looks for, and opens when he gets it, on his weekly visit to his post-office, is his agricultural journal. And the farmer who is most respected and consulted by his neighbors, and whose farm and work are models and examples for the neighborhood, is the one who reads and studies the agricultural papers the most carefully.

BREVITIES.

A matter of course—a horse race at "agricultural fairs.

IF our readers do not have a merry time with our next Seed Distribution—surely it will not be the RURAL'S fault.

"ENTER me for a jackass," was the double-barreled dispatch sent by an honest farmer to the secretary of an agricultural fair.

RESPECTABLE agents for the RURAL NEW-YORKER wanted everywhere. Examine the Premium Lists. Anyone sending us seven subscribers at two dollars each (our only price) will secure the RURAL for one year.

THE Rural Branching Sorghum is, without question, a fine success. No doubt, another year, seedsmen in general will supply the seed. As an ensilage plant, it bids fair, in many parts of the country, to take the place of Indian corn.

AN engraving from a specimen head grown at the Rural Farm of the Black-bearded Centennial Wheat will be presented in our SPECIAL WHEAT NUMBER next week. The beards of this grain turn black and fall so that the head becomes quite beardless.

THERE is, as Mr. Killebrew remarks, no other crop that responds more promptly to the application of manure, or that better repays good cultivation, than oats. On poor ground, with slovenly culture, they scarcely yield enough to pay the expenses incurred, take them year after year.

PROBABLY a higher class of advertisements has never been collected together in any one issue of a rural journal than is to be found in this number of the RURAL NEW-YORKER. We would thank our friends for mentioning this journal when corresponding with any of those whose announcements appear.

THE Brinkle's Orange has heretofore found a place in many gardens for its fine quality, nothwithstanding its tenderness and the fact that it thrives well only in comparatively few sections of the country. But the Caroline is as hardy as any raspberry ever grown in the Rural Grounds, and from all accounts, it bids fair to thrive anywhere.

LAST year the Wysor Fultzo-Clawson offered in our present distribution announcement, bore the largest, heaviest grain we have ever seen. This year, owing to long-continued rains and cloudy skies, all of our wheats are more or less shrunken—the Fultzo-Clawson as much as any. When, therefore, our subscribers receive the seeds they will kindly make due allowance.

PROF. Brewer questions if all the money won at agricultural fairs pays more than half the actual expenses of the winners in entering the object exhibited, caring for it there, and getting it home again. It is not the cup won at a boat-race, that incites young men to do so much labor, spend so much time and money, and exercise so much self-denial while training, but its possession is the sign of victory—and so of the prizes won at our fairs.

Many of the specimens of wheat which we have received in competition for the several little premiums offered by the RURAL a few months ago, are simply wonderful as to size, weight and beauty. Except that we have already more than we can well attend to at this season, when both farm and editoral work presses hard, we should be glad to have all of the specimens nicely arranged and labeled and exhibited at some of our principal fairs. It may be doubted whether so many or such perfect specimens have ever before been collected together.

PROF. ARNOLD forcibly remarks in another column (all should read the article), that a man whose house stands but one chance in a thousand of being annually burned, will not allow it to go a day without being insured, while the income from his dairy, often worth much more than his house, and which stands about one chance in five of being cut down every year, will be allowed to run indefinitely without making any effort to insure himself against oft-recurring losses. Where scholars are so inapt and tuition so expensive, experience may well be said to keep a dear school.

THE RURAL NEW-YORKER FREE

PLANT AND SEED DISTRIBUTION AND PREMIUM LIST FOR 1881-82.

THE RURAL DENT CORN.

The heaviest weight of kernel and ear. One hundred and seventeen bushels of shelled corn per acre on 50 acres. So certified to.

The Rural Thoroughbred Flint.

Raised in the Rural family for 26 consecutive years.

Wysor's Cross-Bred Fultzo-Clawson Wheat.

The largest kernel of any wheat in cultivation—so claimed. Hardy, disease-resisting, prolific.

MATCHLESS WHEAT.

Four kernels in a breast. Very prolific and hardy. At the rate of 72 bushels per acre has been produced on small plots.

Shumaker Wheat.

Early. Prolific. Hardy.

CHALLENGER LIMA BEANS.

"Seed selected through three generations," Often six beans to a pod. "Double the yield of any other Lima."

Perfection Golden Heartwell Celery.

Several hearts to a stalk.

The Perfect Gem Squash.

A marvel of productiveness. Fine-grained, sweet, dry, combining the excellencies of both the summer and winter squash.

RURAL CHATER HOLLYHOCK.

A perfection flower. Three feet of brilliantly colored rosettes; white, lemon-buff, rose, red, crimson, maroon and nearly black.

All Except Three Never Offered For Sale.

$2,000 worth of Gifts from Rural Patrons for the Best Yields.

NOTES FROM THE RURAL EXPERIMENT GROUNDS.

For the information of many into whose hands the present number of the RURAL NEW-YORKER may fall, or who see it for the first time during the past four or five years, or since it has been under its present management, it is necessary to repeat that the Experiment Grounds owned by this journal and worked, in so far as this is possible, in the interests of its subscribers, consist of eighty-two acres. Eighty acres, situated in Queens Co., L. I., comprise the farm, where all new agricultural seeds of special promise are tested. During the present season we have tested 77 varieties of wheat; 15 of new seedling potatoes; 16 of corn; 12 of oats; 6 of fodder plants, many new vegetables, roots, etc. Two acres and a fraction, situated in Bergen Co., New Jersey, are devoted to experiments with all sorts of hardy ornamental trees and shrubs, small fruit, grapes, etc., etc. Since we have neither plants nor seeds to SELL, since, indeed, we have no interests to subserve save those of our readers, our reports of the results of our tests are fully accepted as trustworthy, and the true value of hundreds of new and high-priced seeds and plants is made known. When, by such tests, we find that a given plant is more valuable than others of its kind which have been generally cultivated, we, at once if practicable, place it in our next Distribution, and send it without charge to all of our subscribers who apply. These distributions are

ABSOLUTELY FREE,

and their primary object has always been, and is, to promote the interests of agriculture and horticulture everywhere. It is true we thus seek to extend the influence of our journal, but our first aim is as above stated, and we beg to say that the means of the Rural New-Yorker are such, that the cost of our Distributions is not permitted to stand in the way of an introduction of new seeds or plants, which either cannot be procured elsewhere, or if they can, only at a very high price.

POSTAGE.

As all our readers know, we have heretofore borne a part of even the postal expenses of the seeds and plants we have sent out. Our object in not charging the entire postage to those who apply is to prevent the possibility of a suspicion that we receive in *any form* the slightest compensation for our labor or for the heavy cost of these distributions. Besides, these offerings are *not premiums* and they are sometimes made without requiring either an application or *any* payment of postage. We *hold the right to continue them or to discontinue them as we may determine.* The postal cost of our present distribution will be about (we can not determine it positively at this date) 10 CENTS PER COLLECTION. *Of this we shall charge those who apply 6 cents only.* Those who subscribe through us, however, for the "Inter-Ocean," Detroit, "Free Press," or "New York World," are not required either to send any postage or to make any application, as this has been provided for in the clubbing price with the publishers of those journals.

$2,000 FOR THE BEST YIELDS FROM THE RURAL SEED.

The valuable list of gifts to those who succeed in producing the best yields from several kinds of seeds in our present distribution will be found following our description of the kinds so offered. The goodly number of articles will give reasonable grounds of hopes to all who compete for them. The object is not only to awaken the liveliest competitive interest in the growth of the seeds, and to inspire a love of careful, painstaking, systematic culture, but also *to test the value of new methods* of culture. These will be presented in these columns in due time. The RURAL merely dictates as to the number of seeds to be sown and the area upon which they shall be sown, and the kind of culture to be given. The intensity of the culture, the kinds and quantities of manure used will be optional with those who enter for the gifts.

FIG. 430. SIDE VIEW.

FIG. 431. KERNEL OF THE RURAL DENT CORN.

The First Free Distribution for 1881-2.

The Rural Heavy Dent Corn.

The name of the originator of this variety of corn and its history are not presented for excellent reasons which will appear later. The engravings, Figs. 430 to 432, A and B, are from life and the ear is in size merely an average of those sent us for seed. Of this we have about two acres growing at the Rural Farm, which will not have matured until these pages are before our regular readers. We therefore present the letter and description of the very trustworthy farmer who first called the variety to our notice.

Loudoun Co., Va. 4-2, 1881.

Editor RURAL NEW-YORKER:

Dear Sir: Your favor of March 30th, to hand. I am glad the corn reached you safely.

A surveyor measured one acre of standing corn, thought to be an average of ten (10) consecutive acres in a fifty-acre field, which measured acre made 114½ bushels of shelled corn of 56 lbs. to the bushel. The corn was planted about the first of May and husked out the latter part of September. The crop above stated was raised in 1880. Four of the best farmers in my neighborhood husked the above acre while the stalks were still standing, and shelled out as above stated. The same field was in corn in 1878, and the whole 50-acre field made per acre 117 bushels of shelled corn of 56 lbs. to the bushel, which gave the entire yield of the field 5,850 bushels. The corn was planted three feet each way, thinned to two stalks in a hill. It is generally a single eared corn, though often two good ears grow to a stalk.

About 25 years ago I picked out a few of the best ears, the seed of which was planted the next year to itself, and produced a better crop than the other portion of the field. The ears now are double the size they were then.

I have taken a number of State and county premiums for the best sample as well as the largest product. The field on which the above crops were raised is rolling upland and not above the average of my farm of 485 acres.

Very Respectfully,

WM. H. B.

We may add that a peculiarity of this corn is that it shrinks less than any dent corn we know of, while the shape of the ears and of the kernels, and the almost unvarying regularity with which they are placed in the rows are unexceptionable. *The same weight* of corn will be sent to each applicant so that all may have an equal chance.

FOR HIGHER LATITUDES

the Rural Heavy Dent Corn would not be suited. As we desire that all of our subscribers may, as far as possible, interest themselves in this great corn trial, we have been growing a very prolific kind of new hard corn which we shall call

The Rural Thoroughbred Flint.

All who prefer this to the Dent will kindly so designate in their letters of application. These applications, it is requested, will be made out on separate slips of paper, with full name and address given as follows:

"Send seeds. (Dent or Flint, as preferred).

JOHN HARRISON,
Newark, Kent Co.,
Michigan.

Six cents inclosed."

The Rural Thoroughbred Flint is extremely early; in favorable seasons it matures in one hundred days. It grows to the hight of six feet, branching considerably, each branch often bearing an ear and the main stalk two. It has been cultivated in the Rural family for 26 consecutive years.

Wysor's Hybrid Fultzo-Clawson Wheat.

Next we shall offer the above entirely new wheat, which has been grown at the Rural Farm for three years, always yielding heavily. It is extremely hardy and the grains in favorable seasons are probably larger than those of any other variety known. The relative size is shown in the engraving, a grain of Clawson, (A) Fig. 435, having been selected for comparison. The average head, Fig. 433, is 3½ to 4 inches long, with seven breasts to a side and two kernels in a breast. The straw grows to a hight of 4½ feet. It is not heavy but very strong, and never lodges. Mr. Wysor (the originator) gives the history of this wheat as follows:

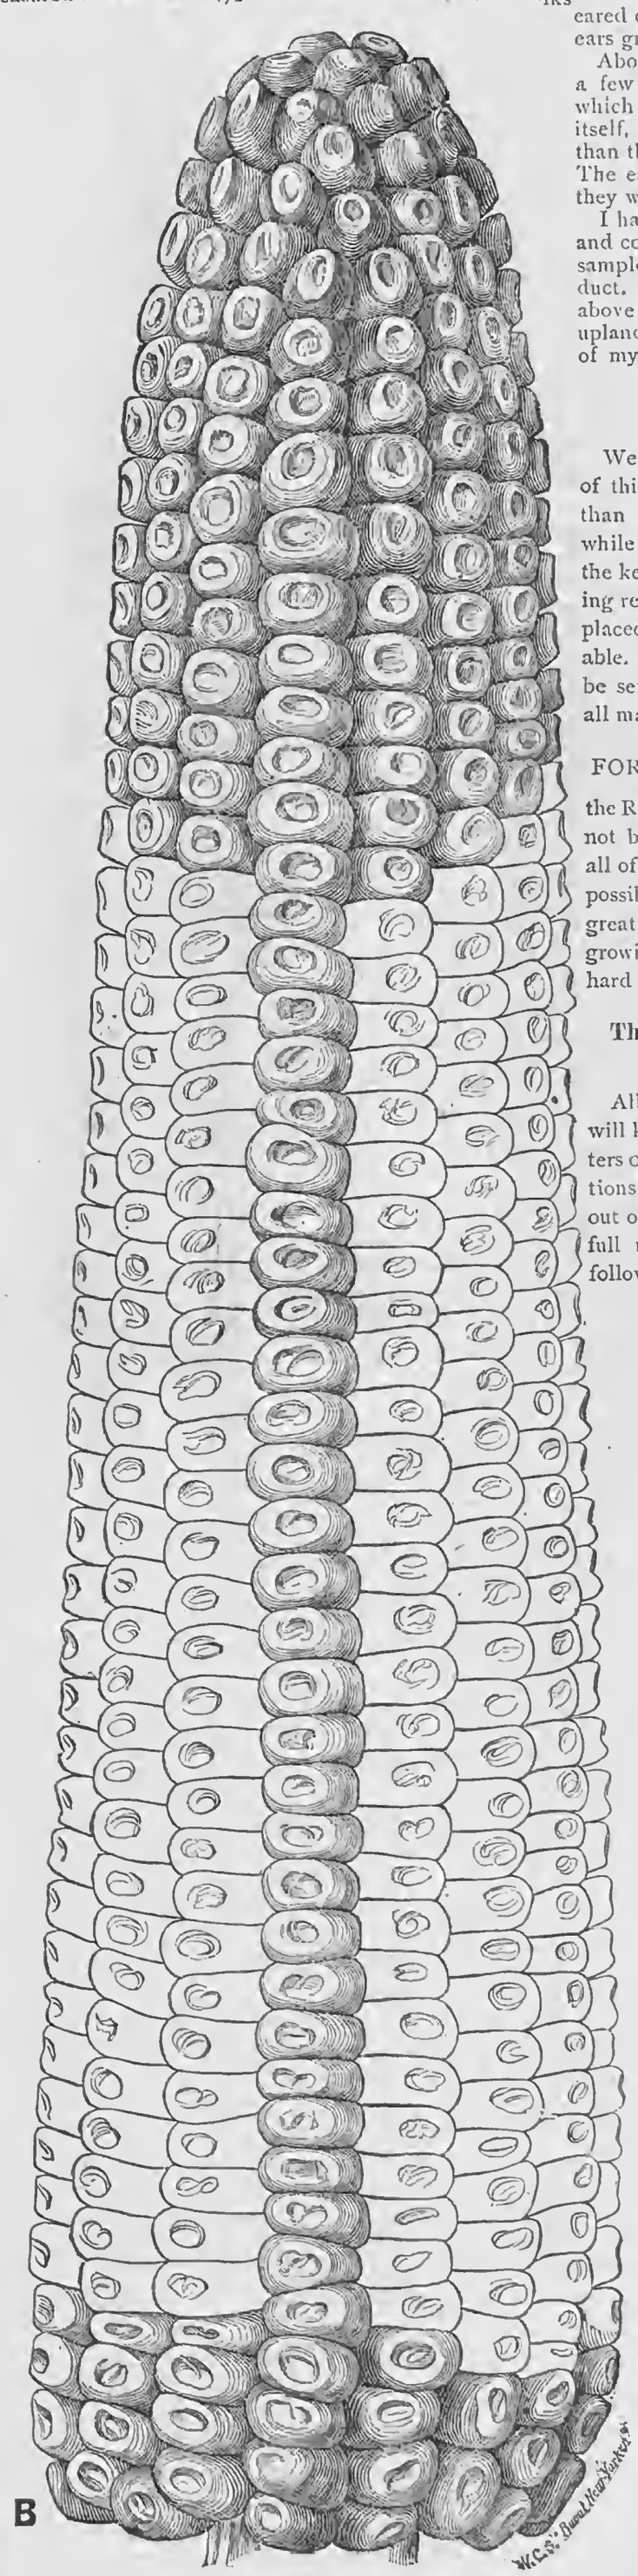

FIG. 432. RURAL DENT CORN.

July 25th, 1881.

I give below the history of F. C. No. 1.

This wheat originated in the year 1877 from a head of Fultz impregnated with pollen from the Clawson. It was one among four or five kinds to which this crop gave rise, and was selected on account of the large size of the kernel. A cut with a short description of it appeared in the Wheat Number of the RURAL for September 13th, 1879. As it had not then been sufficiently tested, no other claim was there made for it beyond that it carried the largest kernel of any of our American wheats. It still maintains its superiority in this respect, being larger than the much lauded "Golden Grains," with which I have compared it this season. It has now been sown long enough to develop other important qualities, not the least among which is its ability to withstand without serious injury the attack of mildew. Till this season, it has been sown on rich alluvial soils, which had never, except in very dry seasons, yielded anything but large crops of rust-eaten straw, containing but little grain. The Fultzo-Clawson has never once been injured, and the quality of the wheat has always been good. I do not believe there is a so-called "rust-proof wheat," but this will come as near being rust-proof as any. It is as hardy and reliable as the Mediterranean, and is, besides, a much greater yielder. It may be always relied upon to produce a fair crop under unfavorable circumstances.

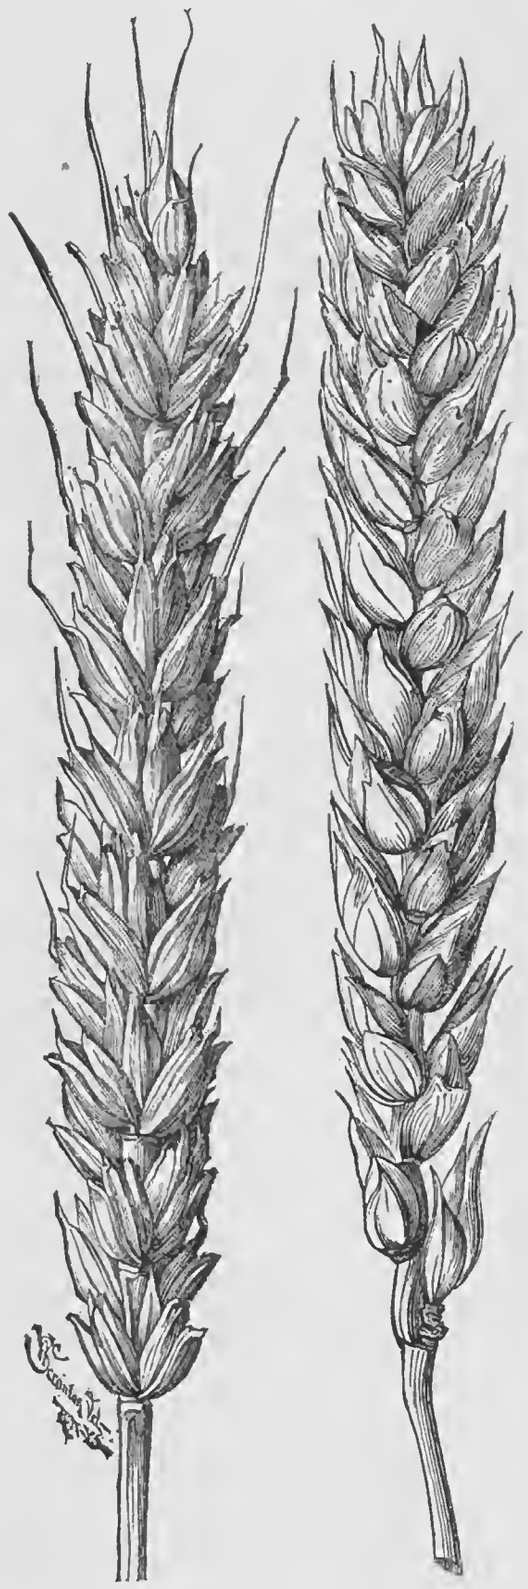

FIG. 433. WYSOR'S FULTZO-CLAWSON.

FIG. 434. SURPRISE.

On small plots, it has yielded at the rate of 60 bushels per acre; on areas exceeding an acre, 28 bushels per acre. Twenty bushels of it were sown for the first time last Fall on 12 acres of thin clay soil with 200 lbs. per acre of bone dust and guano mixed. The yield of the whole field is estimated at 25 bushels per acre in the face of a drought of 8 weeks' continuance, and it is of a quality unsurpassed.

Its time of ripening is from 2 to 4 days later than that of the Fultz: the chaff is of an orange color, and the straw, a golden yellow. The flour made from it is superior to that from either Clawson or Fultz.

FIG. 435.

Yours very truly, H. L. W.

The same quantity of this wheat will be sent to each applicant. The presents, as detailed in the list, apply only to the two kinds of corn above mentioned, and this wheat. Next we offer the

Matchless Wheat,

with a $25.00 cash premium for the five heaviest heads. See Fig. 434, from life.

It was so named by Mr. Wysor, who sent us a few grains for trial several years ago. The past season we raised one-tenth of an acre, the product of which was three bushels one peck. This is all the seed there is of this variety, and the quantity sent to each applicant will, necessarily, be very small. We hasten its distribution in the hope that it may prove among the most prolific varieties known, for the reasons: 1st., that it is extremely

FIG. 436. RURAL CHATER HOLLYHOCK.

hardy; 2d, that the straw is heavy; 3d, that it resists rust, and 4th, finally that each breast matures three and often four grains. The straw averages four feet in hight. The average head is nearly three inches, six breasts to a side. The kernel is white and hard and of medium size. Twenty-five dollars in cash will be given by the RURAL for the five heaviest heads.

This originated at the same time, and from the same ear as Wysor's Fultzo-Clawson. Mr. Wysor says that he believes it to be the most prolific variety of wheat known, and that it will probably succeed wherever Clawson does well. "On small plots," Mr. Wysor writes, "it has yielded at the rate of 72 bushels per acre."

Shumaker Wheat.

Two years ago we received, at our request, two pounds of this from the Michigan Agricultural College, having heard that it had yielded forty bushels to the acre in Michigan. Our experience with it has been most satisfactory. It yields here, and we have not a first-rate climate or soil for wheat, over thirty bushels to the acre. Of our 77 varieties this proves to be the very earliest and one of the hardiest. It takes the lead of all others in vigor of early Spring growth so that it has a better chance of resisting all insects and diseases. The past backward season it was headed out May 22, and ready to cut July 7.

The rather slender straw grows 4½ feet high and is of a reddish color. The narrowly pointed heads average three inches in length. Six breasts or spikelets, two grains each, beardless as shown in the engraving. Fig. 439. The kernel is long, medium-sized, dark amber, hard and it makes, we are told, an excellent flour. The chaff is brown, clean and glossy. We are not aware that this valuable grain has been offered by seedsmen, for which reason it has been deemed desirable to place it as one of the kinds of our present distribution.

Challenger Lima Beans.

Mr. Richard Purdue brought to the RURAL office last year a number of the beans which have been named as above. The pods, of which our engraving shows the average size, contained *six* beans. The following, which we believe to be entirely trustworthy, is all that need be said respecting this variety.

N. J., Jan. 26, 1881.

Editor RURAL NEW-YORKER:

The Lima Beans which I sent you have been kept strictly pure in one family for three generations, being constantly improved by saving seed from the strongest vines that had the largest number of beans in the pod. When green they are very compact in the pod, and will yield almost double the bulk of shelled beans to the bushel of any other Lima, which makes them the best bean for either market or private use. The majority of all the pods contain five beans and occasionally six. Yours respectfully,

RICHARD PURDUE.

We have a large plot of the Challenger Lima growing; but, at this writing, it is too early to speak as to their size or yield.

Seventh, is offered what we believe to be a decided improvement in that choicest of vegetables, celery.

Perfection Golden Heartwell.

This entirely new strain, a sport of the Golden Half Dwarf, is just what its name indicates. The habit is also "half dwarf," but its valuable peculiarity is that each inner stalk, instead of producing one single heart, as in

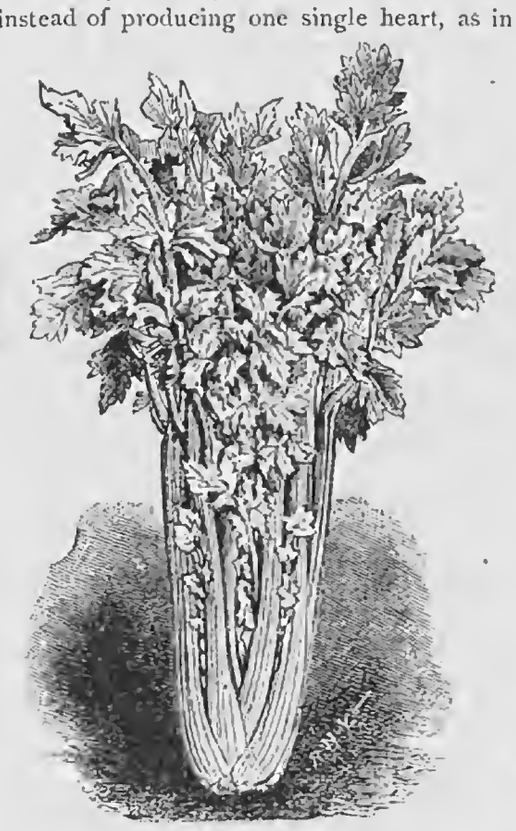

FIG. 437. PERFECTION GOLDEN HEARTWELL.

other kinds, forms several which when mature literally burst through the outer coverings, as shown in the engraving. It fairly promises to take the place of any kind previously introduced. Fig. 437.

The Perfect Gem Squash

was offered last season for the first and its very superior qualities make us wish to place it in the hands of all our subscribers. It is a marvel of productiveness and excellence, while its keeping qualities are scarcely surpassed by those of any other kind. It combines the excellence of both Winter and Summer Squashes. A vine was shown to us by the introducer, that bore 24 perfect squashes within an area of three feet square.

It is probably the sweetest, richest squash in cultivation and we trust our readers may give it a fair trial. Finally for our lady readers we have to offer the

Rural Chater Hollyhock.

The RURAL attempted years ago to distribute Chater's strain of Hollyhock, but owing to the failure of the seed crop in England, which was caused by the hollyhock disease, our effort was a failure or nearly so. Since that time we have, at the Rural Grounds cultivated the best named varieties of Mr. Chater's strains, and we can assure our readers that nothing like them is known in America. The plants are dwarf and the stems are a mass of brilliant rosettes, as double as possible from near the ground to the tip of the flowering stem. The colors are white, buff, lemon, rose, chocolate, crimson, and a very dark purple, nearly *black*. As we can procure no seeds from England, our supply will enable us to send but a very few to each of our readers and we respectfully ask their best attention, offering our assurance that they will be amply repaid therefor. Fig. 436.

FIG. 439. SHUMAKER.

Special Notice.

Only yearly subscribers are entitled to apply for this Distribution.

Two three-cent stamps *must be* inclosed in the letter of application, or we cannot agree to fill the order. Our object in bearing a part of the postal expense is, as before stated, to prevent the possibility of a suspicion that we receive in *any form* the slightest compensation for our labor or for the heavy cost of the undertaking. As stated elsewhere, however, we have made such arrangements with the Chicago Inter-Ocean, Detroit Free Press, N. Y. World, and several others, as will be seen, that those who order those journals *with* the RURAL NEW-YORKER will receive the seeds WITHOUT application and without the postage, that being included in the CLUB PRICE, to simplify matters.

Each letter of application will be NUMBERED when received, and the seeds and plants will be sent in that order.

It will save us trouble, and it will save our subscribers trouble and expense if they will make their application for the seeds and plants in the same letter in which they renew their subscriptions. We would also thank them merely to say: "SEND SEEDS," and to designate which of the two kinds of Indian Corn offered is preferred. Those two words will convey all the instructions we need.

All questions appertaining thereto should be written on *separate slips of paper*, otherwise there is a chance of their being entirely overlooked, or, at least, of not being promptly answered.

Finally, in order to provide against the possibility of mistakes, disappointment or any dissatisfaction, we agree to duplicate all orders that from any cause may have failed to reach their destination at the close of the Distribution, which will be the latter part of next Spring. The most careful details of instruction as to the treatment of the seeds—which will be distributed about the first of February—will be given in future numbers of the RURAL NEW-YORKER.

It will be useless for any persons to apply for our seeds or plants unless they are yearly subscribers. The reasonableness of this restriction will appear without further remark. We might be willing, or even desirous, to supply our seeds to all who read our announcement; indeed we would be glad to do so since there is no more effectual way of promoting the interests which the RURAL has at heart, but this is obviously impossible. Hence we strictly limit our distribution to subscribers.

We desire to make it plain, also, that our seed and plant distributions are in no sense *premiums*. As it is optional with us whether we offer them or not, it is our privilege to state when the distributions shall begin and when they shall be discontinued, so long as we liberally fulfil every obligation to which we commit ourselves.

FIG. 438. CHALLENGER LIMA BEAN. FROM LIFE.

THE RURAL NEW-YORKER PRESENTS

FOR THE

BEST YIELDS OF CORN AND WHEAT FROM THEIR FREE DISTRIBUTION of 1881-82.

$2,000 Worth of Presents.

WHEAT PRESENTS.

For the BEST YIELDS of the new Cross-bred Wheat "Fultzo-Clawson" from the SEED of the RURAL NEW-YORKER FREE DISTRIBUTION. To be sown next Fall, (1882).

One of Walter A. Wood's latest improved Automatic Twine Self-binding Harvesters, presented by the RURAL NEW-YORKER, $300.

One of Higganum's Automatic Corn Planters, presented by the Higganum Mfg. Corporation, Higganum, Conn. $. 75.

One American Fruit Dryer, presented by the American Fruit Dryer Co., Chambersburg, Pa. $ 75.

One Weed Cabinet Sewing Machine, presented by the RURAL NEW-YORKER. $75.

Fertilizers from our stock of complete manures, pure bones &c., to the amount of fifty dollars, or FIFTY DOLLARS IN CASH, as winner may select, presented by Mapes Formula and Peruvian Guano Co., New York City. $50.

Collection of Flower and Vegetable Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $50.

One Cycle Ensilage Cutter, presented by New York Plow Co., 55 Beekman St., New York. $50.

One Silver-plated Tea Set, six pieces, Tea, Coffee and Hot-water Urns, Cream Pitcher, Sugar and Slop Bowls, presented by the RURAL NEW-YORKER. $48.

Victor One-Horse Grain Drill, presented by Ewald Over, Indianapolis, Ind. $25.

One handsome Silver-plated Ice Pitcher, presented by the RURAL NEW-YORKER. $14.

Collection of Flower and Garden Seeds, presented by R. H. Allen & Co., 189 and 191 Water St., N. Y. $10.

100 Skowhegan Raspberry Plants, presented by J. T. Lovett, Little Silver, N. J. $10.

Collection of New Grapes, one vine each, Poeklington, Jefferson, Prentiss, Duchess, Early Dawn, Vergennes, Highland, Lady Washington, Bacchus, presented by J. T. Lovett, Little Silver, N. J. $12.50.

One dozen Silver-plated Teaspoons, presented by the RURAL NEW-YORKER. $6.

One Keystone Washing Machine, presented by the RURAL NEW-YORKER. $6.

One Silver-plated Cup, presented by the RURAL NEW-YORKER, $4.

Special for "Surprise" Wheat.

T. D. Carman, for RURAL NEW-YORKER, for the five largest heads of SURPRISE WHEAT, (see description.) Cash, $25.

CORN PRESENTS.

For the BEST YIELDS of the RURAL DENT or THOROUGHBRED FLINT CORN, from the SEED of the RURAL NEW-YORKER FREE DISTRIBUTION. To be planted NEXT SPRING.

One Loring & Blake Palace Organ, presented by the RURAL NEW-YORKER. (See page 598) $205.

New Spring Tooth Sulky Harrow, with Force-Feed broadcast Seeder, presented by the Wheeler & Melick Co., Albany, N. Y. $60.

Big Giant Corn Mill, latest improved, size No. 2, presented by J. A. Field & Co., St. Louis, Mo. $60.

Farmers' Friend Two-Horse Corn Planter, with drilling attachment, presented by Farmers' Friend M'f 'g. Co., Dayton, Ohio. $55.

Fertilizers from our stock of complete Manures, pure bones, &c., to the amount of fifty dollars, or FIFTY DOLLARS IN CASH, as winner may select, presented by Mapes Formula and Peruvian Guano Co., New York City. $50.

Silver-plated Tea Service, six pieces, Tea, Coffee and Hot-water Urns, Cream Pitcher, Sugar and Slop Bowls, presented by the RURAL NEW-YORKER. $48.

Porter's Patent Wire Cable Derrick complete, with Champion Hay Carrier, presented by J. E. Porter, Ottawa, Ill. $45.

Veteran Corn Sheller complete with Table Crank and Band Wheel, presented by Sandwich M'f'g. Co., Sandwich, Ill. $33.

A selection of Vegetable and Flower Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $30.

Collection of Plants, presented by Peter Henderson, & Co., 35 Cortlandt St., N.Y. $25.

Collection of Vegetable and Flower Seeds and Bulbs, presented by J. M. Thorburn & Co., 15 John St., N. Y. $20.

One No. 3 Cornell Corn Sheller, presented by Treman, Waterman & Co., Ithaca, N. Y. $18.

Adamant Plow, presented by New York Plow Co., 55 Beekman St. $15.

Hoosier Corn Drill, presented by Hoosier Drill Co., Richmond, Ind. $15.

Planet Seed Drill, presented by S. L. Allen & Co., Philadelphia, Pa. $14.

One handsome Silver-plated Ice-Pitcher, presented by the RURAL NEW-YORKER. $14.

Collection of Flower and Vegetable Seeds, presented by Peter Henderson & Co., 35 Cortlandt St., N. Y. $10.

100 Manchester Strawberry plants, presented by J. T. Lovett, Little Silver, N. J. $10.

Collection of Flower and Garden Seeds, presented by R. H. Allen & Co., 189 and 191 Water St., N. Y. $10.

One Silver-plated Cake-basket, presented by the RURAL NEW-YORKER. $9.

One Aquapult, (Force Pump,) presented by the RURAL NEW-YORKER. $9.

One Peerless Clothes Wringer, No. 2, presented by the RURAL NEW-YORKER. $8.

Patent Screw Wedge one-horse Cultivator, presented by the Wheeler & Melick Co., Albany, N. Y. $8.

Peter Henderson, four books, Gardening for Profit, Gardening for Pleasure, Practical Floriculture and Hand-book of Plants, presented by Peter Henderson & Co., 35 Cortlandt St. $7.50.

One Keystone Washing Machine, presented by the RURAL NEW-YORKER. $6.

One dozen Silver-plated Tea Spoons, presented by the RURAL NEW-YORKER. $6.

One Silver-plated Cup, presented by the RURAL NEW-YORKER. $4.

The Truth About It.

The Rural New-Yorker is Generally admitted to be the First Agricultural and Horticultural Authority of America.

It is the First Journal to have established an Experiment Farm worked exclusively in the interests of its readers.

IT IS THE FIRST TO HAVE MADE REGULAR FREE DISTRIBUTIONS OF NEW AND VALUABLE PLANTS AND SEEDS AMONG ITS SUBSCRIBERS.

In this way it has introduced the following:

Beauty of Hebron Potato, White Elephant Potato, Mold's Ennobled Oats, The Cuthbert Raspberry, Champlain Wheat, Telephone Pea, Clawson Wheat, Rural Branching Sorghum, Golden Rural Tomato, Defiance Wheat,

Giant Purple Dutch Asparagus, Argenteuil Asparagus, Acme Tomato, Yucca filamentosa (Adam's Needle), Geranium sanguineum, Magnolias of various kinds, Rural Bronze Ricinus, Iris Kœmpferi, Abies Siberica, Pinus edulis, Hibiscus Syriacus, Hibiscus militaris, Hibiscus Moscheutos, Deutzias, Weigelas, Rural Hybrid Aquilegias, Bronze Lettuce, Eryngium Lævenworthii, Hybrid Pentstemons, Vitis heterophylla, Molucca Balm, Grindelia squarrosa, Pyrethrum roseum,

AND MANY OTHERS.

82 acres of Experiment Grounds devoted to tests of all kinds appertaining to plant life, and the best farm and garden methods. All new plants and seeds adapted to the climate are tested as soon as announced in this country or in Europe, and their value impartially reported upon. In such reports the readers of the RURAL NEW-YORKER have before them a trustworthy guide as to what seeds or plants are worthy of trial.

Over Five Hundred Original Engravings Yearly

OF ALL KINDS OF FRUITS, FARM ANIMALS, THE CHOICEST OF OUR ORNAMENTAL TREES AND SHRUBS, OF COUNTRY DWELLINGS, ETC.

For the North, South, East and West.

A COMPLETE NATIONAL JOURNAL OF RURAL AFFAIRS

Truth, progress, the real interests of the land and those who cultivate it; the dissemination of improved seeds and plants, and of the knowledge how best to cultivate them; to conduct the journal so that it may have a just claim upon all who love nature are among the aims of the RURAL NEW-YORKER.

Farmers and gardeners—rural people of any and every occupation—city people who have conservatories or gardens, if not familiar with the RURAL NEW-YORKER inquire as to its standing and influence of those who are, and SUBSCRIBE FOR IT AS A MEASURE OF ECONOMY.

A $4.00 Paper for $2.00 per Year.

TRUSTWORTHY MARKET REPORTS

From all centers a specialty. Special departments devoted to the News of the Week, to Women, to Domestic Economy, to Religious Matters, Fashions, Literature.

It will help you to make money and spend it judiciously. You cannot afford to do without it.

Send for Specimen Copies which will be mailed free; Compare it with other Journals and subscribe for the best!

$2.00 PER YEAR POST-PAID.

Address, THE RURAL NEW-YORKER,

34 Park Row, New York.

The RURAL improves, I had nearly said, with every number, and it must be considered the model agricultural journal. Its influence for good I know is very great.
Kansas State Ag. Coll. PROF. E. M. SHELTON.

What we like best of all about the RURAL is the purity of its contents and its valuable information; but we would like it better if its bright, piquant face would appear daily. The Beauty of Hebron is worth the subscription price, so we get the best agricultural paper *free*.
Primrose, O. D. H.

Right worthily is the RURAL leading all its contemporaries in enterprise. May it continue long to bless our farmers and others with its ennobling advice and instruction.
NELSON SLATER.

I am much pleased with the RURAL. I think with it as a guide, we farmers need not be humbugged by worthless fruits and vegetables.
Fayette Co., Ia. J. A. RICE.

ADDITIONAL PREMIUM LIST

The Casaday Sulky Plow.

This plow is made by the Oliver Chilled Plow Works, South Bend, Ind., and wherever it has been used it has given the best of satisfaction. It turns square corners without being lifted out of the ground, turns an even, regular furrow without a driver, and carries every pound of weight on its wheels at all times. In fact it is a plow suitable for all kinds of soil, rough or even ground, and warranted by the manufacturers to do all that can be done by any other plow. We offer two sizes; one Full Steel with Rolling Coulter and 3-horse evener, iron wheel, price $60, for a club of 140 subscribers; and the other, same as above, with steel or chilled mold-board, cast shares and jointer, iron wheels, two-horse, price $50, for 114 subscribers.

Porter's Patent Wire Cable Derrick, and Champion Hay Carrier.

For stacking in the field. Furnished complete. Price $45. Given for a club of 52 subscribers at $2 each. Made by J. E. Porter, Ottawa, Ill., who will furnish particulars upon application by postal card.

1882.

Premium List

OF THE

Rural New-Yorker.

The Most Popular Rural Journal in America.

The only paper that Owns and Operates an Experiment Farm and Horticultural Grounds in the interest of its Subscribers.

32d Year of its age—5th year of its present Management.

Valuable Premiums offered to all who assist in increasing its Circulation for 1881-82.

Readers and Agents are Solicited to examine them carefully.

GENERAL INSTRUCTIONS.

Any respectable person may act as agent.

Send subscriptions as fast as taken (with exact amount, viz., $2.00), and if seeds and plants are wanted by subscriber, send six cents additional *for postage on seeds*, or the subscriber himself may apply for plants and seeds.

Old and new subscribers count in clubs, and they may be sent from different post-offices.

Specimen Copies and posters supplied FREE on application, for Canvassing purposes.

All premiums are sent at the expense of the agent, unless otherwise noted.

As a rule, we prefer to send articles by express (we consider it safer), but any mailable article will be sent by mail, with or without registry. If the latter, it is at the agent's risk. If the former, the registry fee must accompany the order.

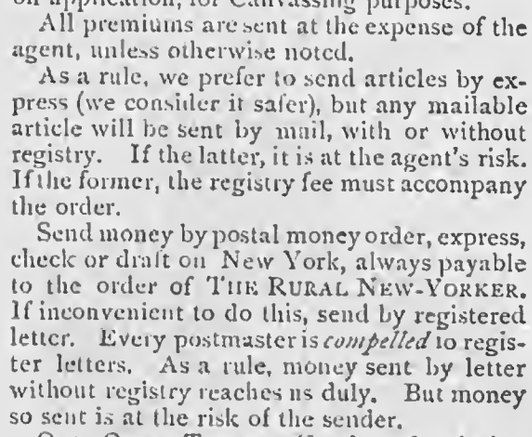
Send money by postal money order, express, check or draft on New York, always payable to the order of THE RURAL NEW-YORKER. If inconvenient to do this, send by registered letter. Every postmaster is *compelled* to register letters. As a rule, money sent by letter without registry reaches us duly. But money so sent is at the risk of the sender.

OUR ONLY TERMS.—Yearly subscription post-paid (52 weeks), $2.00; half-yearly (26 weeks), $1.10. Payments invariably with the subscription. This Premium List holds good until July 1st, 1882.

PREMIUMS.

No. 1. Walter A. Wood's Mower.

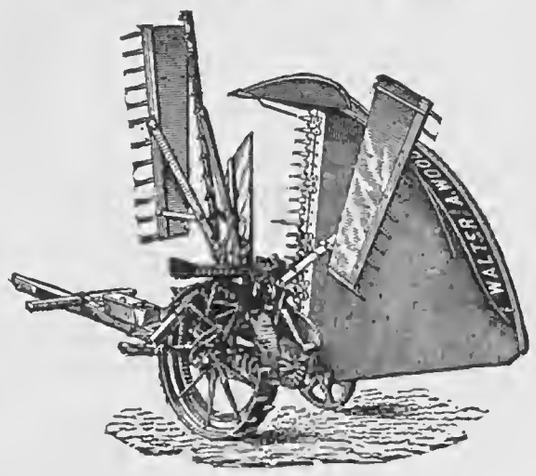
In this machine, simplicity in construction, lightness in weight, symmetry in form and elegance in finish, are combined with strength, durability and efficient working qualities. Needless machinery traps are avoided. It is less complicated, easier to repair, and less liable to get out of order than any other



mower. The one represented by the above illustration has a 4 ft. 3 in. cut, and is fully warranted. The manufacturers of this machine have received a great many medals of honor, both in this and foreign countries and all are well deserved and honestly won. Price of the above mower $85. Given for a club of 100 subscribers at $2 each.

No. 2. Walter A. Wood's Junior Sweep-Rake Reaper.

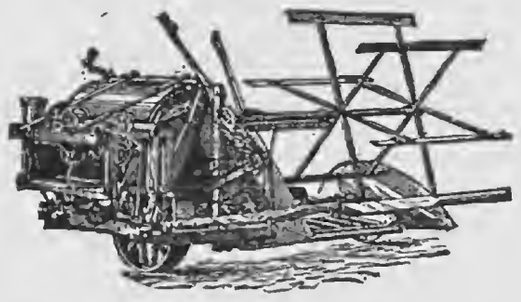
This machine was brought out in Europe in 1872, and in this country in 1875. Since its introduction its success has been rapid and uninterrupted, its sales in that period having reached a very large number, both here and abroad. The steady increase in sales from year to year, and the victory it has won in field contests, demonstrate its merits beyond any encominms of ours. Taught by practical experience in the field, the manufacturers have strengthened this machine from year to year—the most important improvements having been



made in 1878, by adding the fifth rake, and automatic device for completely controlling the rakes. There are many valuable points of excellence about this machine, which space at this time will not permit us to mention; but we confidently believe that whoever is fortunate enough to secure one of these machines will be entirely satisfied with it. We give the Junior with 5 ft. cut; price, $125 for 150 subscribers, at $2 each.

No. 3. Walter A. Wood's Automatic Twine Self-Binding Harvester.

This machine was put upon the market in 1880 to meet a growing demand for a self-binder that uses twine as a material for binding, instead of wire. It has been thoroughly tested on different kinds of grain and has proven itself a machine with superior qualities as a harvesting and binding machine; and the manufacturers, confident of their superior

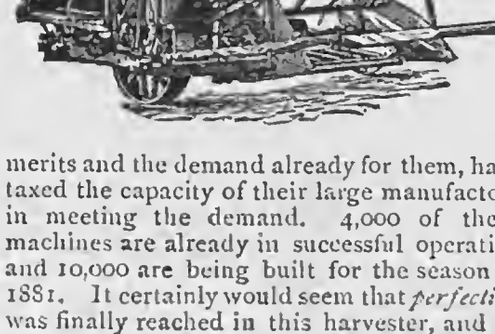


merits and the demand already for them, have taxed the capacity of their large manufactory in meeting the demand. 4,000 of these machines are already in successful operation and 10,000 are being built for the season of 1881. It certainly would seem that *perfection* was finally reached in this harvester, and in offering it to our friends we feel fully confident that whoever may secure this premium will be fully and entirely satisfied with the prize. Price $300. Given for 300 subscribers.

The above machines (Nos. 1, 2 and 3) are supplied to us by the Walter A. Wood Mower and Reaper Machine Co., Hoosick Falls, N.Y., a firm established in 1853, and to-day one of the largest manufacturers in this country. They have steadily increased in business every year since they started, and have made and sold over 375,000 machines during the past quarter of a century. This fact is sufficient guaranty that we are using nothing but the best machines in the market for our premium list.

No. 4. Matthews' Seed Drill.

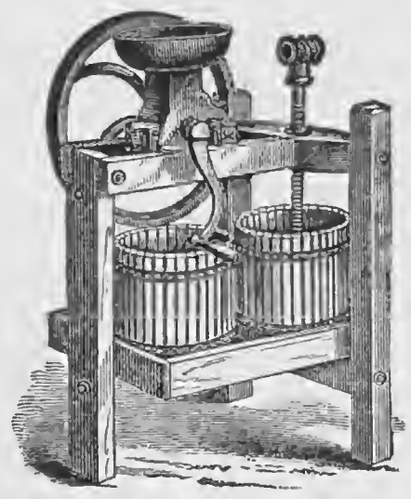
This is one of the best known garden drills. It will open a furrow, drop seed accurately the desired depth, cover it, lightly roll it, and while performing these operations mark the next row. It sows with an eveness and rapidity impossible for



the most skillful hands to do. It will sow all the varieties of beet, carrot, onion, turnip, parsnip, sage, spinach, sorghum, peas, beans, &c. The drill is complete in all its arrangements, and very durable. 28 subscribers, at $2.00 each, will obtain one of these drills. Made by Everett & Small, Boston, Mass.

No. 5. Farmer's Favorite Cider Mill, No. 1.

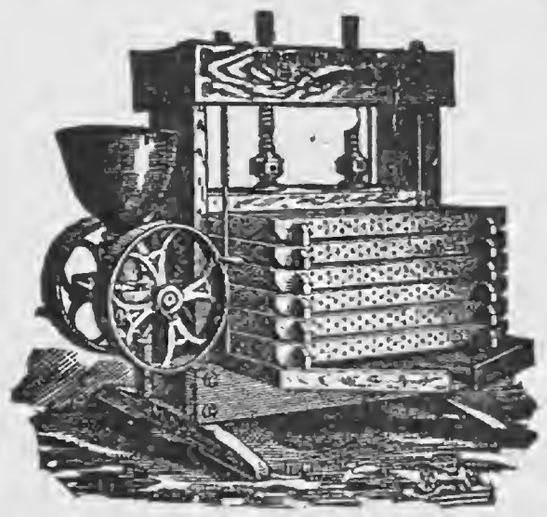
The cut represents the *family mill*, which has now been on the market for five years past, and is pronounced to be the best, simplest and most perfect mill built. The grinding apparatus is so made that it does not slice and cut the fruit, and leave it in hard lumps, but thoroughly crushes and grates it, so that every cell is broken and a fine pomace produced. Can be taken apart in two minutes, and thoroughly cleaned and



replaced without any trouble, and is capable of grinding ten bushels of apples per hour. Price $22. Given for a club of 44 subscribers. Manufactured by Higganum Manufacturing Corporation, Higganum, Conn.

No. 6. Farmers' Favorite Mill and Press Combined:

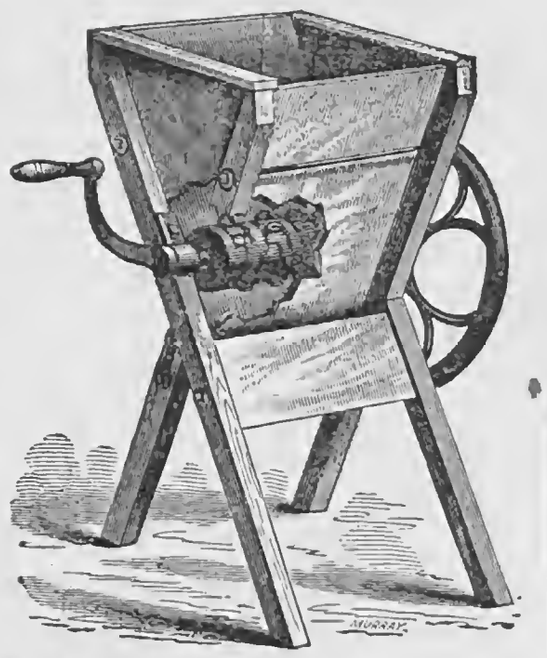
Made by the same manufacturers as No. 5, and designed to be run by hand or power, as



shown by the above cut. Will be given for a club of 125 subscribers. Price $75.

No. 7. Clark's Root Cutter, No. 2.

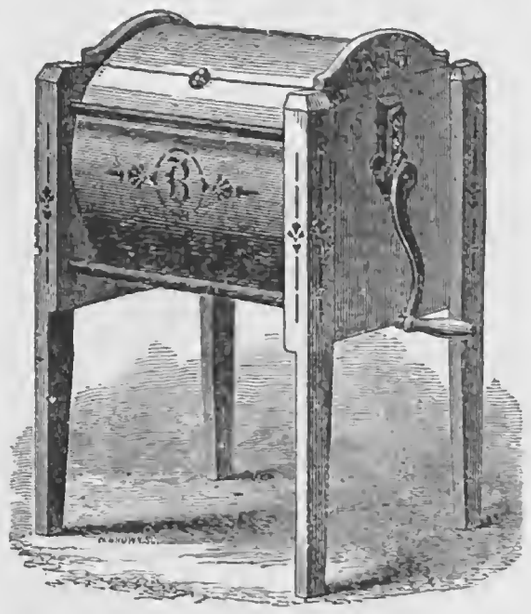
Among stock raisers, this is a very useful and valuable implement. It cuts all kinds of roots in shape for feeding, and is pronounced



by all who have used it to be first-class in every respect. Price of the one here offered, $14. Given for a club of 28 subscribers. Made by same manufacturer as Nos. 5 and 6.

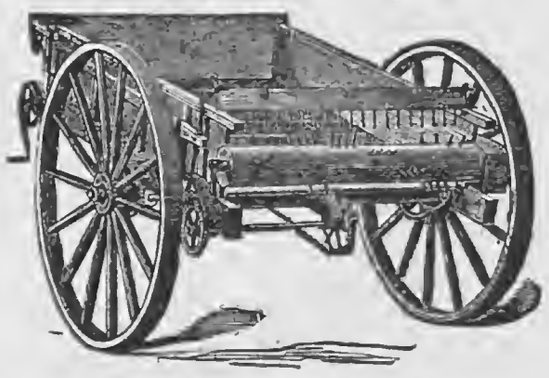
No. 8. The Blanchard Churn.

We take great pleasure in offering this churn to our friends. It is classed among the



leading churns of this country, and the manufacturers are among the most reliable. The father and sons have been engaged in making churns for over 50 years, and during that time have become familiar with all the essential points necessary for the construction of a churn such as will meet with the endorsement of the public. This they have accomplished in the new Blanchard, and all who secure a present so useful and reliable as this, cannot help but be delighted with it. We offer *two* sizes. No. 3 (two gallons) for a club of 10, and No. 5 (eight gallons) for a club of 14. Price $6 and $8. Made by Porter Blanchard's Sons, Concord, N. H.

No. 9. Kemp's Manure Spreader.

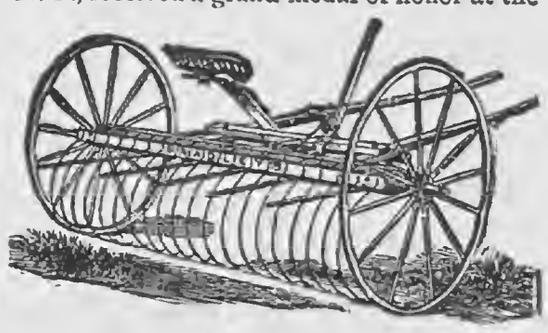


This is a new and valuable implement for the farm, and does its work more efficiently and in less time than it can be done by hand. It spreads equally well all kinds of manure, coarse or fine, as well as lime, ashes, marl, muck, cotton seed, etc., either wet or dry, and in such quantities as may be desired.

The price is $110, and we give it for 240 subscribers. Made by the Kemp & Burpee Manufacturing Co., Syracuse, N. Y.

No. 10. Bradley's Self-Dumping Hay Rake.

This rake, made by Bradley & Co., Syracuse, N. Y., received a grand medal of honor at the



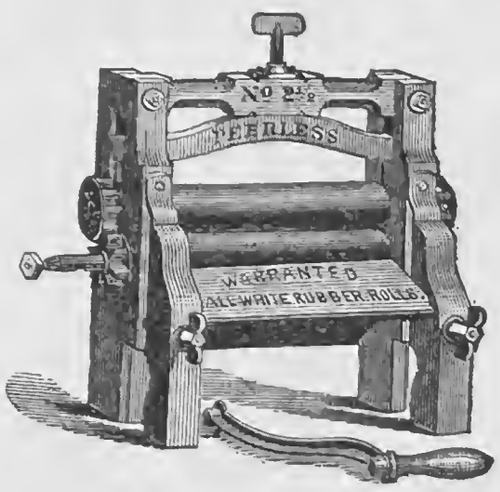
Centennial Exposition. It has many points of excellence. Is made of the best material, and fully guaranteed. Price $38. Given for a club of 70 subscribers at $2.

No. 11. The Aquapult.

A more useful machine than this it would be difficult to find. It can be used as a fire engine

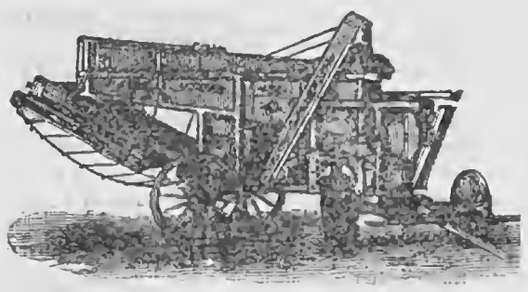
portable force pump, sprinkler, window washer, bug destroyer, etc. The method of using it is shown by the illustration. It will throw water forcibly against a second story window or on roofs that do not exceed that height. It will pay for itself in one season, if used only for sprinkling the garden and lawn, and every one that has not one of these useful machines should set to work at once and secure enough subscribers to entitle him to one. Price $9. Given for a club of 10 subscribers at $2 each. Made by W. & B. Douglas, Middletown, Conn.

No. 12. The Peerless Clothes Wringer



Who can afford to do without a clothes wringer, when one can be obtained so easily? Any competent person, male or female, can secure one of these labor-saving machines by one day's canvassing for the RURAL NEW-YORKER. We have selected size No. 2, believing it to be best adapted to general family use. Its finish is perfect; it has a strong frame, white rubber rolls, metal journals, patent crank and tub fastenings, and everything to make it a first-class wringer in every respect. It is made and sold by the Peerless Wringer Co., of Cincinnati, and costs $3. We give it for a club of 6 subscribers at $2 each.

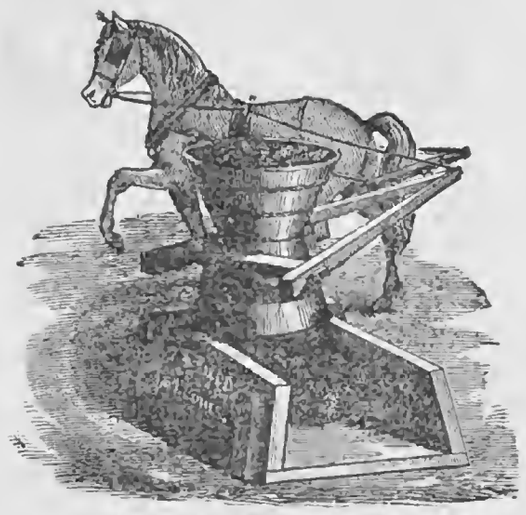
No. 13. The Butterworth Thresher.



Made by the New Jersey Agricultural Works, Trenton, N. J.

This Thresher is made upon honor and is fully warranted by the manufacturers, who claim it will do as *much* and as *good* work as any machine made. It has many superior points which space will not permit mentioning, and we are fully confident that whoever secures one of these Threshers will be entirely satisfied. Price of the one here shown, $375.

Given for 1000 subscribers.



No. 14. Improved Big Giant Feed Mill,

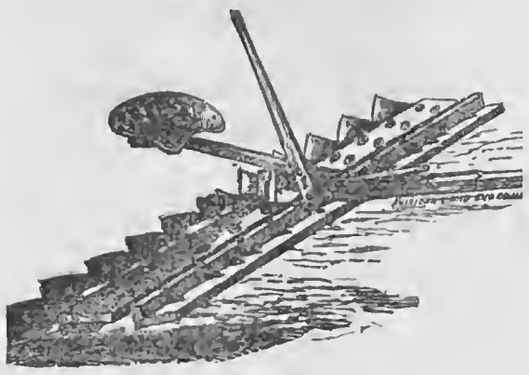
manufactured by J. A. Field & Co., St. Louis, Mo. This mill is especially adapted for grinding all kinds of grain for home and farm use. It grinds corn and cob together or any kind of feed, coarse or fine. We can recommend this mill highly. No farmer who is engaged in stock raising to any extent should be without a mill of this kind. Price $60. Given for 90 subscribers, at $2 each.

No. 15. Mitchell Platform Spring Wagon,

With round corner body, seven feet three inches long, nine inches deep, drop end gate. Patent wheels three feet eight inches, and four feet two inches high. Complete, with pole, whiffletrees and neck-yoke, two seats with enameled duck cushions, lazy-back on back seat. Steps on each side. In order to please a number of our agents who have made so many inquiries about this kind of a wagon, we have arranged with Mitchell, Lewis & Co., Racine, Wisconsin, to supply us with these wagons. Every wagon fully warranted. Price, $120. Given for 200 subscribers.

No. 16. Acme Harrow.

Manufactured by Nash & Bro., 22 College Place, New York, and Harrisburg, Pa. This excellent implement, the invention of a man who is himself a practical farmer as well as mechanic, who had previously invented the revolving disc or wheel harrow, seems destined to win a wide popularity. Its sale during the present season has grown rapidly, and testi-



monials, unsolicited, come from every source, highly commending it and praising the workings of this implement.

It is one that combines a clod-crusher, leveler and harrow all in one. It is invaluable for all purposes where a harrow is needed, and is particularly adapted to *hard, inverted sod,* and to ground which has become packed and baked after plowing, as well as to leveling rough land. We have used one of them on the Rural Farm for two years past, and can fully indorse all the manufacturers claim for it. Price, $22. Given for a club of 40 subscribers, at $2.

Nos. 17, 18, 19. Columbia Bicycle.

Here we have a premium that will please our many friends. Nothing equals it for rapidity and ease of travel. The Bicycle is a peculiar vehicle. Approaches to it had long ago been made in pedimotive and manumotive carriages, and especially in two-wheeled velocipedes. The Bicycle proper has superseded all of them, and stands to-day without a rival as a rapid and easy mode of travel. No horse can compare with it for endurance; no other pastime is half so fascinating, and the exercise is recommended by the medical profession as being the most conducive to health. People have traveled over a common turnpike road a distance of 100 miles in seven hours, and 1,400 miles in six days.

We offer three styles of this popular vehicle, *all* of which are *fully warranted* by the *Pope Manufacturing Co., Boston, Mass.*

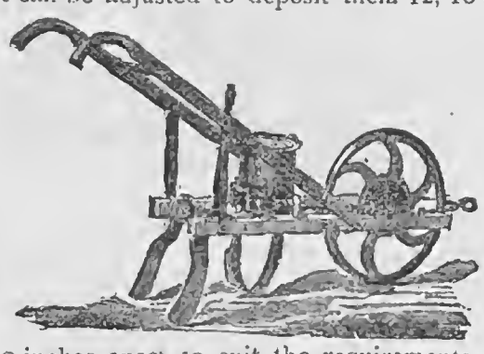
No. 17 is styled the "Standard Columbia," half bright, and painted in two colors; prices from $80 to $100, and any size furnished for 240 subscribers.

No. 18 is styled the "Ordinary Columbia," prices from $60 to $75, and we furnish any size desired for 188 subscribers.

No. 19 is styled the "Mustang," suitable for boys from 9 to 13 years; given for 140 subscribers.

No. 20. Hoosier Corn Drill.

Of the merits of this drill we can safely speak, having used one on the Rural Experiment Farm during the past season, and we are convinced that no corn-grower can afford to be without at least *one* good corn drill. The drill here shown drops with regularity one grain in a place, and is so arranged that it can be adjusted to deposit them 12, 16 or



20 inches apart, to suit the requirements of various kinds of soils. It also at the same operation does the covering uniformly in depth, and its covering shares can be adjusted to cover deep or shallow. There is economy in its use, from the fact that no thinning is necessary and no replanting either, in case good seed is sown. Price $15. Given for a club of 20 subscribers. Hoosier Drill Co., Richmond, Ind.

No. 21. Pearce's Improved Cahoon's Patent Broadcast Seeder.

This seeder sows from four to eight acres per hour at a common walking gait, throwing out wheat about forty feet wide. A saving of four-fifths of the labor and one-third of the seed used in hand-sowing, is effected by using these machines. A person entirely unused to sowing by hand can use them with perfect success. Price $6. Given for 12 subscribers. Made by Goodell Company, Antrim, N. H.

No. 22. The Czar Revolver.

The Czar Revolver, represented by the above cut (which shows ¼ of size) is a decidedly handsome weapon. Its sale has been unprecedented, and it is guaranteed by the manufacturers to be equal in workmanship, material and action to any weapon made. It is 22 calibre, extra long steel barrel. The stock is hard rubber, finely chased and engraved. The frame and barrel are triple

nickel silver plated, and the cylinder and base pin are heavily gold plated. We send this revolver, by registered mail, prepaid, for a club of only 9 subscribers. Made by G. W. Turner & Ross, Boston, Mass.

No. 23. The Cooley Creamer.

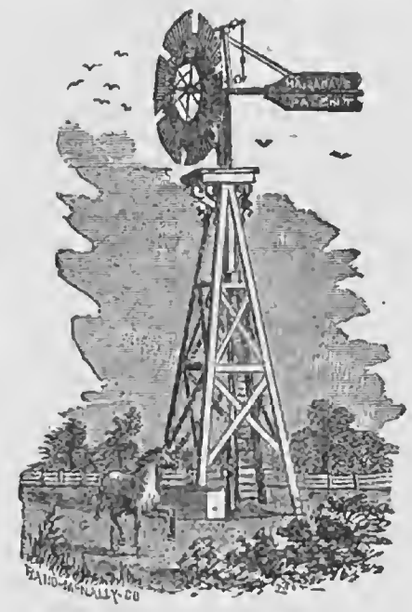
Manufactured by the Vermont Farm Machine Co., Bellows Falls, Vt.

The cut shown represents the "Regular," which has been selected as the style best

adapted to the wants of our patrons. It has been upon the market for four years, and has met with favor wherever used. The use of creamers is becoming so popular, and the results obtained by submerging milk in cold water so far supercedes the old method of separation in shallow pans, that no word of recommendation is necessary from us to prove the utility of this method, and we think our dairy friends will gladly avail themselves of the offer here made. We will send a Creamer same as style shown for 50 subscribers at $2. The price is $35.

No. 24. Halladay Standard Wind-Mill.

Made by the U. S. Wind Engine & Pump Co., Batavia, Ill. The growing popularity



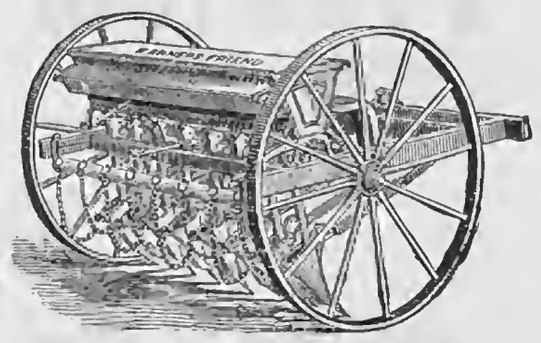
and usefulness of wind-mills, especially among stock-breeders, and their being comparatively inexpensive, with no extra outlay for running them, induce us to offer these mills as premiums. We have chosen the Halladay Standard on account of its many points of excellence, and we believe that whoever is fortunate enough to secure one of these premiums will be fully satisfied. We give No. 2, 10 ft. diameter, weight 450 pounds; price $100, for a club of 160 subscribers.

No. 25. The Planet, Jr., Garden Drill, No. 2.

This drill has a 13-inch wheel and a 7-inch roller. It has a self-cleaning opening plow, adjustable in depth by a thumb-nut, and a marker for rows up to 20 inches. It has a capacity of 2½ quarts. The discharge openings all adjust to the same size at once, and admit of the most minute alteration, instead of restricting the operator to a series of holes, none of which may be the size wanted. The covering is done in the most perfect manner by the rims of the carrying wheels upon which the dirt is first thrown by the plow, and from which, as the

wheels revolve, it is continually returned exactly on top of the seed with regularity and certainty. S. L. Allen & Co., manufacturers, Philadelphia, Pa. Price $12. Given for a club of 24 subscribers.

No. 26 Farmers Friend Grain and Fertilizer Drill.



Made by the Farmers' Friend Manufacturing Co., Dayton, O. For 12 years this drill has been before the public, and its essential features remain to-day as when it was introduced. The manufacturers, after years of careful study, put this drill upon the market, and so nearly perfect was it that the principles of its construction first adopted have been adhered to. The illustration shows the drill in working order.

We offer one of these excellent drills, COMPLETE; that is, a nine hoe, eight inch drill, with spring hoes, fertilizer and grass-seed attachments, rear hoe-shifter, and land-measurer, for 140 subscribers. Price $115.

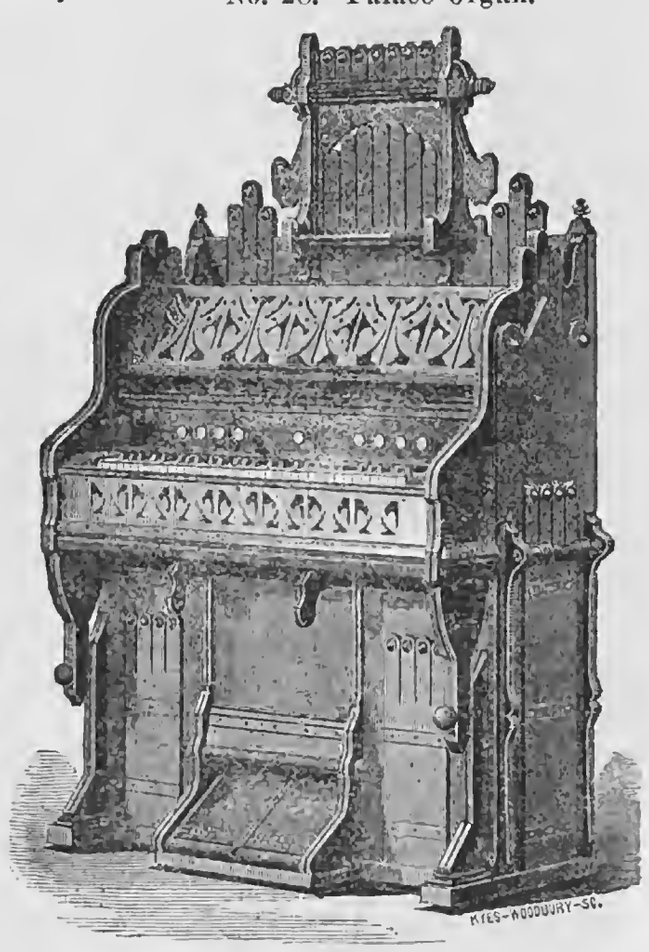
No. 27. The Osborne Plow Sulky.

Probably no implement has ever been invented that is more labor-saving than is a

reliable Plow Sulky. The one here shown has been upon the market since 1870, has been tried in almost every locality and in all kinds of soils, and has never been found deficient or wanting in any of the essential points which make up a good plow.

It received the highest awards at the Centennial Exhibition, and testimonials of reliable and practical farmers from all sections speak of it in the highest terms. We give the plow for a club of 60 subscribers. Price $40. Manufactured by Gregg & Co., Trumansburg, N. Y.

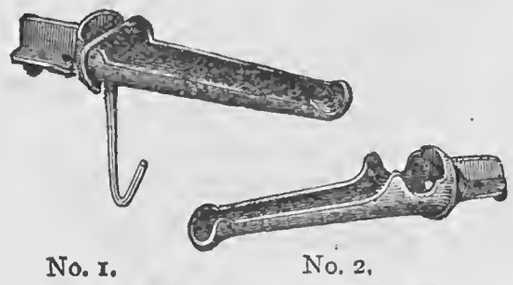
No. 28. Palace Organ.



The Loring & Blake Organ Co., Worcester, Mass., supply us with this organ. In selecting a suitable instrument of this class to offer as a premium, we were guided by the advice of musical friends, and the style we give is thought to be exactly suited to the requirements of the country home. The cut above shows the style of the case used. It is neat in workmanship, and finished in handsomely carved ornaments. The organ is furnished with three sets of reeds—one of twenty-eight notes and two of thirty-three notes each. The power is sufficient to fill any ordinary room completely, and it will lead a fair sized chorus without difficulty. The seven stops—diapason, euphone, eolian, melodia, vox celeste, tremolo and forte, with the patent knee swell, produce a fine combination of musical effects. Price $205. Given for a club of 170 subscribers at $2.00 each.

No. 29. Post's Eureka Sap Spouts.

Made by C. C. Post, Burlington, Vt. These sap spouts have been in use for many years, and have always given the best of satisfaction. They are made from the best quality of iron, and are galvanized. They do not rust or corrode, and will last for generations. They do not injure the tree, and are more quickly adjusted than any others. No sugar maker can afford to do without them. The price of



No. 1. No. 2,

these spouts is $4.50 per hundred (see cuts 1 and 2). It will be observed that No. 1 has a hook for the support of the buckets and No. 2 is designed for buckets that have ears to them, which slip over the end of the spout, and are firmly held by the grooves in the spout. We give 100 of either style of these spouts for a club of 14 subscribers at $2.00 each.

No. 35. Silver Hunting-Case Watches.

The works of these watches are made expressly for us by the Hampden Watch Co., of Springfield, Mass., whose reputation for

making accurate time-keepers is thoroughly established. The works are set in coin silver cases, of our own selection. Price $23, given for 25 subscribers at $2 each.

No. 39. Family Grind-Stone.

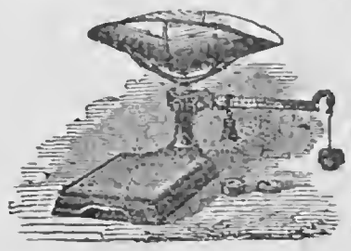
So far as we know, this is the first foot-power machine that is fully adapted to the wants of families for household work, or of mechanics for grinding small tools. The stone is of the best quality, and runs perfectly true. The emery wheel is the same size as the stone, and double-coated on the side and rim with best Wellington Mills emery, and can be taken off when not in use. For grinding carving-knives and all light tools and for polishing cutlery this machine is perfect. Price, including box, $4. Given for club of 8 subscribers. Premiums 39, 42 and 43 are made and supplied to us by the Millers Falls Co., 74 Chambers St., N. Y.

No. 30. Oliver Chilled Plow,

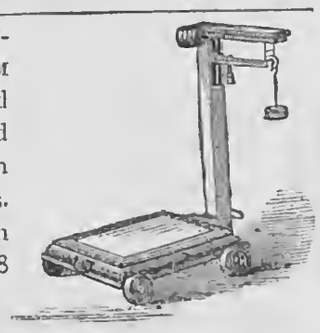
made by the Oliver Chilled Plow Works, South Bend, Ind. For a general-purpose plow we know of none better adapted to the farmers' use than the plow here offered. It is fully warranted by the above firm, whose reliability is unquestioned. There are now more than half a million of these plows in use and the sales this year will aggregate 95,000. We give Nos. 40 or E1, full-rigged; price $16, for a club of only 32 subscribers, at $2 each.

SCALES.

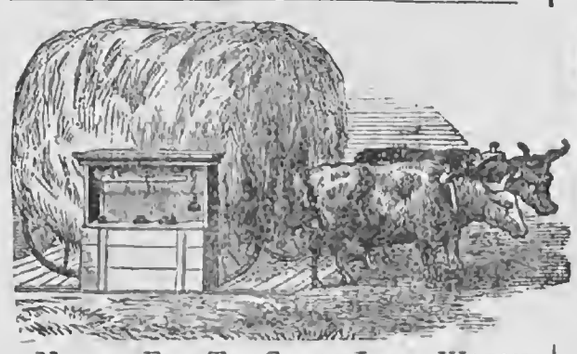
In order to meet the wants of all our friends, we have made a selection of three styles of scales, as shown by the cuts below. All these scales are supplied to us by Jones of Binghamton, Binghamton, N. Y., whose reputation for true and reliable scales is well established.



No. 31 is the "Universal" or Family Scale, and weighs from ½ oz. to 240 lbs., fully warranted. Price $9, given for a club of 16 subscribers.



No. 32. PORTABLE PLATFORM SCALES, furnished with wheels, and has a capacity from ¼ to 400 pounds. Price $18. Given for a club of 48 subscribers.



No. 33. FIVE TON CROWN LEVER WAGON SCALE. Price $60. Given for 90 subscribers.

No. 34. Allen's Firefly Hand Hoe.

A garden that is well kept, is kept so only by the frequent bestowal of hard labor, valuable time and close attention; for many gardens are quite too small and closely planted to admit of horse culture. The Firefly Hand Hoe and Plow

changes this tiresome task into one of comparative ease and pleasure, and at the same time enables the user to complete his work far better and in one-sixth of the usual time. The furrows for beans, corn, peas and potatoes can be opened by it, and afterwards covered neatly. Price $4.00. Given for a club of 7. S. L. Allen & Co., Philadelphia, Pa.

No. 36. The Monitor Clock.

Our illustration is about a quarter of the size of the clock. The Monitor is an accurate time-piece, and an alarm and a daily calendar in addition.

The *white* dial is 3¾ in. in diameter; the clock is wound, set and regulated at the back, and the admirable "movement" is inclosed in a seamless copper case, that is stamped out and heavily nickel-plated. The elegance of the design speaks for itself. A club of 7 secures the "Monitor."

No. 37. The Traveler.

This is a new and elegantly designed clock, with nickel front and back, and the sides of glass, which shows the inside workings of the clock. It has an alarm, and is nicely fitted in a paste-board box. It can be carried in a satchel when traveling, with no danger of disarrangement. It is also a very nice clock for the house. We present it for a club of 10 subscribers.

The above premiums, Nos. 36 and 37 are made and supplied to us by the Waterbury Clock Company, New York, and the RURAL is the sole paper that can use them as premiums.

No. 38. The Weed Sewing Machine.

The cut above shows the style of the machine here offered, and it is useless to speak of this old and valuable household article. We have used them for years as premiums, and have yet to hear of the first complaint. It is noiseless in its operation, light in running, and simple in its construction. We give cabinet style as shown by cut, price $80, for a club of 50 subscribers. Made by the Weed Sewing Machine Co., Hartford, Ct.

No. 40. The Mitchell Farm Wagon.

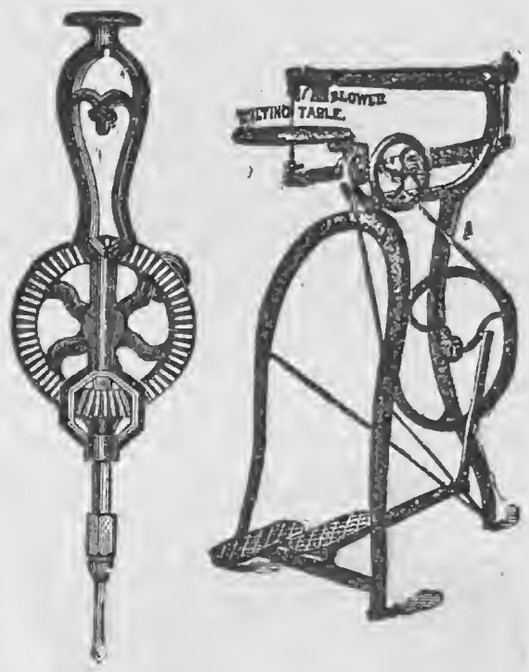
In offering this wagon again this year we hope to please as many of our friends as we did last year. It is certainly a prize worth having, and general satisfaction is expressed by all who have used them. It is made of thoroughly seasoned timber, and of the best iron and steel. The one we offer has a 3¼ x10 inch skein and 1⅝x9-16 and ⅝ inch tire. It is supplied with steel spring seat, Hurlburt patent brake, top-box, whiffletrees, evener, neck yoke and stay chains; in fact, everything in readiness for service. The price has advanced this year to $110, and we present it for a club of 160 subscribers at $2 each. Made by Mitchell, Lewis & Co., Racine, Wis.

No. 41. Ryder's American Fruit Dryer or Pneumatic Evaporator.

In selecting the above drier we have made choice of one which, from personal knowledge, we know to be all that is claimed for it. Its triumphs and first premiums at agricultural societies, its competitive record and indorsement from the leading fruit growers in all sections, are conclusive evidences that whoever secures one of these premiums will not be disappointed in its working. The No. 2, which we offer, is justly styled the Family size, and has been selected as the most desirable for general use among our readers. The trunk is 28 inches wide and eight feet long; there are five lines of trays (22), each 18x26 inches, a galvanized wire-cloth bottom, and it is capable of holding 15 bushels of fruit at one filling. Price $75. Given for a club of 75 subscribers at $2 each. Made by the American Fruit Drier Company, Chambersburg, Pa.

No. 42. Hand Drill, No. 4.

A drill stock eight inches in length, and weighing eight ounces. It is made of iron, with rosewood handle, and brass chuck for holding the drill points. This chuck is made on a new plan and it centres and holds the drill perfectly. With each drill stock we send a box containing six superior drill points of various sizes. A more serviceable tool for the farm or workshop could not be given. Price of stock and drills 50 cents. We send it for a club of 2 subscribers at $2 each.

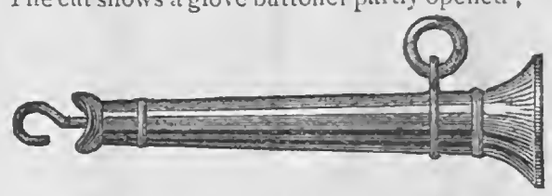


HAND DRILL. NEW ROGERS SAW.

No. 43. The New Rogers Saw.

This saw, with all the improvements that ingenuity can suggest, is without doubt one of the most complete and best saws made for the price asked. The entire framework is made of iron, painted and japanned black, and ornamented with red and gilt stripes. The arbors, etc., are made of steel, and are all carefully gauged and fitted to their bearings. The arms and pitmans are of the best selected *ash*. All parts made to interchange. In fact it is made throughout to *last* and to give entire satisfaction. We have used many of them for premiums and they have given universal satisfaction. Price $4. Given for a club of 10 subscribers.

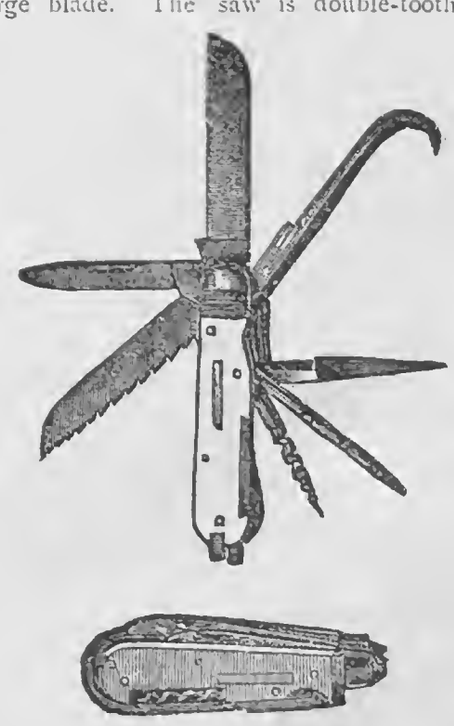
No. 44. This little charm is of gold plate. The cut shows a glove buttoner partly opened;



the same style is made with pencil. Both of these are useful as well as ornamental, and would be suitable as a present. But little exertion is required to secure it as it is given for a club of 3 subscribers. Price $1.50. Supplied by G. S. Clark, 535 Pearl St., N. Y.

No. 45. Multum-in-Parvo Pocket-Knife.

Nothing in the way of knives combines as many conveniences as the one shown in the illustration. Open, it is a magazine of tools; shut, it is as compact and as neat in appearance as could be desired. As its name suggests, it is much in little. The engraving shows the parts of the knife, except the very effective screw-driver hidden by the opened large blade. The saw is double-toothed,



and will cut an inch board, saw off a good-sized stick, cut a notch, etc. The Hook is used to lift a stove-cover, pry open sundry things, clean a horse's hoof, etc. The Punch

makes holes in harness, wood, etc., which can be enlarged by its sharp corners. The Gimlet and Corkscrew are convenient of course. The Tweezers and long Pointer, or Brad-awl, drawn from the end of the handle, often come into use. The back of the Hook makes a good Hammer for tacks and small pounding. The inside of the Hook forms a small Nut-cracker. All inclosed in a compact white handle, the whole weighing only two ounces. Given for a club of 8.

No. 46. The Keystone Washer.

This washer is warranted by the manufacturers to wash clean, if properly used, without rubbing, anything that can be washed by

hand. It is easy in operation, does not wear the clothes, and, if properly used, will last for years. Price $7.00; given for a club of 5 subscribers at $2 each. Made by F. F. Adams & Co., Erie, Pa.

No. 50. No. 49. No. 47.

No. 47. Gent's Double Curb Chain.

Rolled plate; solid gold tips. Price $8. Given for a club of 16 subscribers.

No. 48. Same as 47,

only lighter in weight. Price $6.50. Given for a club of 12 subscribers.

No. 49. Lady's Gold Guard.

Rolled plate front, slide and tip. Price $10. Given for a club of 22 subscribers.

No. 50. Lady's Guard.

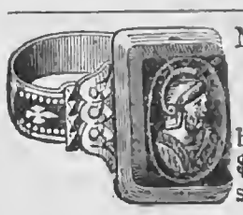
Same as above, only heavier. Price $16. Given for a club of 34 subscribers.

No. 51. Is an Elegant Cameo Ring.

suitable for lady or gentleman. Price $5. Given for a club of 10 subscribers, at $2 each.

No. 52. Cameo and Pearl Ring.

Latest design, very handsome. Price $6, given for a club of 12 subscribers.



No. 53. Gent's Intaglio Seal Ring.

An entirely new and beautiful design. Price $12. Given for 24 subscribers.

We have many statements from subscribers to the effect, that the Free Seed and Plant Distributions of the Rural New-Yorker, have proven of more value to them yearly than the subscription price of the paper.

Read the Free Plant and Seed Distribution Announcement.

No. 54. Lady's Ring.

Two full pearls and ruby. Price $15. Given for a club of 30 subscribers.

No. 55.—One Dozen Celluloid-Handle Table Knives. Price $10.25. For a Club of 18.

No. 56.—One Dozen Celluloid-Handle Dessert Knives. Price $9.25. For a Club of 17.

No. 57.—One Dozen Hard Rubber-Handle Table Knives. Price $8.75. For a Club of 14.

No. 58.—One Dozen Hard Rubber-Handle Dessert Knives. Price $8.25. For a Club of 13.

No. 59.—One Carver, Fork and Steel; Celluloid-Handles and Patent Rest. For a Club of 11.

No. 60.—One Carver, Fork and Steel, Hard Rubber-Handles and Patent Rest. For a Club of 8.

No. 61.—Child's Set in Case, consisting of knife, fork and spoon—all heavily plated and very handsome. Price $3. Given for a Club of 6.

No. 62.—Same as above on card instead of case, and with a lighter plating. Price $1.50. Will be given for a Club of 3 subscribers.

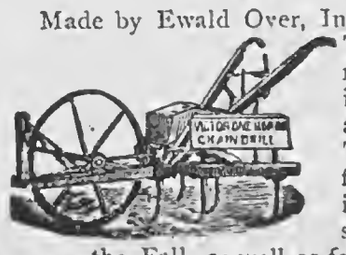
No. 63.—A very nice nut-pick. Price 75c. Given for 2 subscribers at $2 each,

All of this very excellent cutlery (including No. 45) has been selected for us by the Meriden Cutlery Co., and represents the cream of their manufacture in this particular class of goods. Their reputation is not confined to this country alone, and the articles are perfect in every respect. The Celluloid is a substance that resembles, and is an improvement upon ivory, as it does not turn yellow with age, and is nearly indestructible.

The Hard Rubber makes an excellent handle, as it is impervious to heat, and will bear the hardest usage, with the least appearance of wear.

No. 64. Victor Five-Hoed One-Horse Drill.

Made by Ewald Over, Indianapolis, Ind.



These drills are rapidly increasing in demand, and popularity. They are used for sowing wheat intoand between standing corn in the Fall, as well as for sowing wheat, rye, oats, barley, rice, peas, etc., into fallow ground. They are strong, simple in construction, of light draught, and can be expanded and contracted for five different widths, varying from 6¼ to 8½ inches from centre to centre of tooth. It has a splendid force feed, and sows more than half as much as a two horse drill. Price $25. Given for a club of 50 subscribers.

No. 65. Silver-Plated Service

of six pieces, comprising tea, coffee and hot-water urns, cream pitcher, sugar and slop bowls. Price $48. For a club of 48.

No. 66. Tete-a-Tete Service

of four pieces. Price $23. For a club of 23.

No. 67. Ice Pitcher.

Price $14. For a club of 13.

No. 68. Cake Basket.

Price $9. For a club of 8.

No. 69. Pickle Castor.

Price $2. For a club of 5.

No. 70. Butter Dish.

Price $6. For a club of 6.

No. 71. A Set (2) of Flower Vases.

Price $8. For a Club of 8.

No, 72. Drinking Cup.

Price $4. For a club of 5.

No. 73. A half-dozen Napkin Rings.

Price $4. For a club of 5.

No. 74. One Dozen Silver-Plated Table Spoons.

Price $10. For a club of 16.

No. 75. One Dozen Silver-Plated Medium Forks.

Price $10. For a club of 16.

No. 76. One Dozen Silver-Plated Tea Spoons.

Price $6. For a club of 8.

No. 77. Silver-Plated Fruit Knife.

For a club of 5.

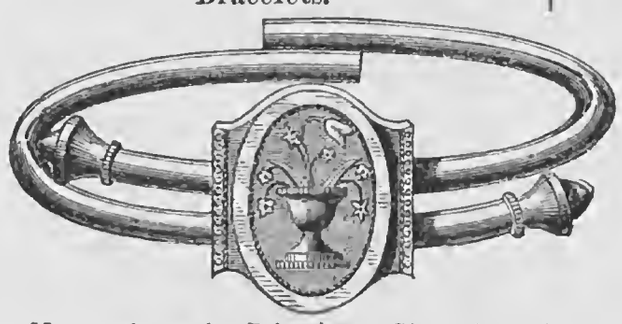
The forks and spoons offered above are especially commendable for beauty of design, (the style illustrated, named the "Niagara," is one of the most recent patterns), and the thorough and *honest* manner in which they are made. Electro-plating, like charity, can be made to cloak any amount of fraud, and it is only in the *reputation* of the manufacturer that the purchaser has any guarrantee that the article is as represented.

The process of electro-plating with silver is quite simple. The articles to be coated with a film are placed in a "bath," which is composed of double cynadide of silver and potassium, held in a wooden vat. The articles are hung by copper wires from brass rods; and then the connection is made with the battery, and after about an hour the process is completed. Almost any kind of metal may be thus coated; hence it may be seen that the worth of the goods depends entirely on the honesty of their maker. We have always been extremely careful to select our silver-ware premiums from those only whose reputation is unblemished, and we have had our reward in the satisfaction expressed by our friends.

No article of this character receives such constant hard usage as forks and spoons, therefore it is of the first importance that the metal *underneath* the silver coating should be thoroughly adapted to its use. These articles are from the well-known house of Hall, Elton & Co., Wallingford, Conn., whose forty years of experience are a substantial guarantee of manufacturing the quality of the premiums above described.

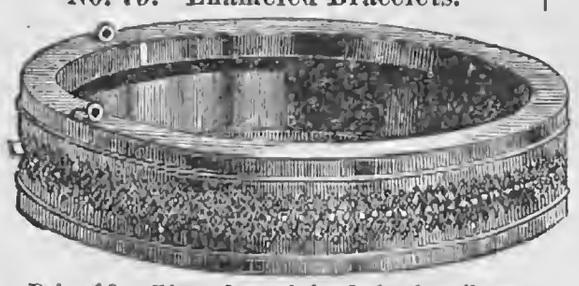
This silver-plated ware is also from the factories of Hall, Elton & Co., [See Nos. 65 to 77.] The designs are unique and strikingly handsome—the tete-a-tete set notably so. The pickle castor contains two fine cut-glass cruets (large) and a pickle fork. The stand is very ornate. The flower vases are painted on a tinted porcelain surface. The subjects are artistically treated and the effect is imposing. In short, the entire selection is one of the finest we have ever offered as premiums, and the articles are given for very small clubs in proportion to the value of the premiums. As serviceable presents nothing can be nicer than this ware.

No. 78. A Pair of Bangle Adjustable Bracelets.



New and novel. Price $15. Given for a club of 30 subscribers.

No. 79. Enameled Bracelets.



Price $8. Given for a club of 16 subscribers.

In the selection of this class of goods we have been particularly careful, and have only chosen those articles that are new and useful. For a holiday present nothing is more beautiful than *good* jewelry, and our friends will find nothing here offered that is not true to the description given, and hence need have no hesitancy in making their selections. The stock is from Henry C. Haskell, 12 John Street, New York.

When ordering rings, send a ring of wire of the size required, or a piece of cardboard with a hole cut in it the size of finger, will do. The cuts show the styles, and the prices here given are the retail prices in New York, and Nos. 51-54 are sent free of postage.

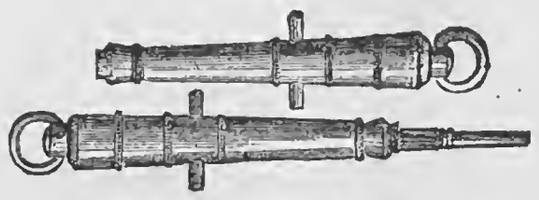
No. 81. Bell-Head Pencil.

Heavy rolled plate. Price $1.50. Given for 3 subscribers.

No. 82. Magic Charm, with Pencil.

Price $1.25. Given for a club of 3 subscribers.

No. 83. Cannon-Charm for Watch-Chains.



Contains pencil. Price $1.25. A club of 3 subscribers will obtain one.

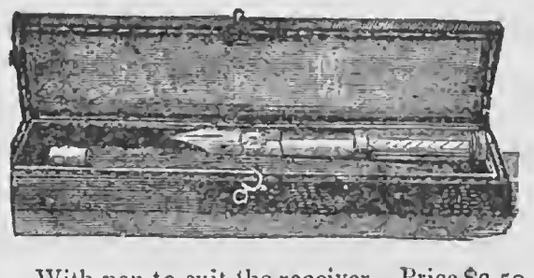
No. 84. Telescopic Pen and Pencil.

Rolled Gold. Very fine. Price $3.00. Given for a club of 7 subscribers.

No. 85. Enameled Charm Pencil.

Price $1.25. Given for 3 subscribers.

No. 86. Gold Pen, Ebony and Gold Holder.



With pen to suit the receiver. Price $2.50. Given for a club of 5 subscribers.

Nos. 81–86 are supplied to us by Messrs. Ludden & Dow, 192 Broadway, New York.

No. 87. Noyes' Hay Carrier.

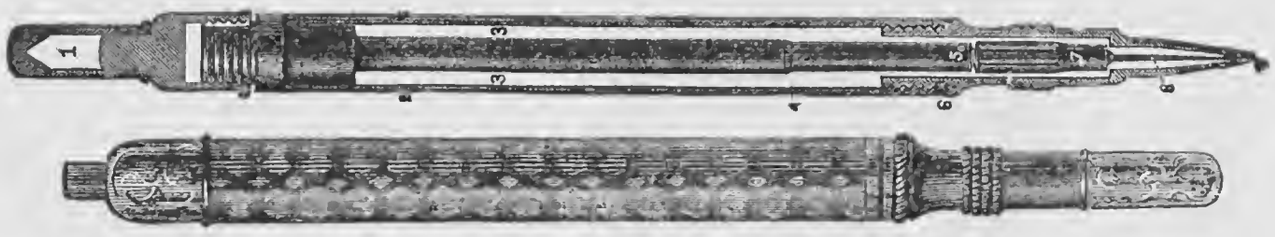
Our farmer friends, we are sure, will be delighted with the offer here made. This carrier has stood the test of many years and has given entire satisfaction. It has been exhibited at a great many fairs and has received many first premiums. It can be used for unloading either within or without the barn, and for removing hay from, as well as putting it into the barn. It can be used equally as well for stacking in the open field, with very little expense for the stacking-frame. A very usefuland practical machine. Price $10. Given for a club of 20 subscribers at $2 each. Made by the U. S. Wind Engine and Pump Co., Batavia, Ill.

SPECIAL NOTICE.

Space will not permit us at this time to enumerate all the books we can furnish, or even to speak of the merits of any of them; and hence we make the following suggestions, and leave our friends to make their own selections.

Our books are furnished us by the old and well established publishing house of Lee & Shepard, Boston, Mass., to whom our subscribers and agents can send for a catalogue, which will be furnished free upon application by postal card to the above address. Any book in their regular list may be chosen and ordered from us at the list price, by counting every subscriber 50 cts. on the price of the book ordered. For instance; if you have twenty subscriptions to your credit, it will entitle you to $10 worth of books. The postage is extra in all cases, and must be forwarded with the order.

This plan will enable our friends to make their selection from the publisher's list and will give them the choice of a great variety of good and valuable literature.



No. 80. The Mackinnon (Reservoir) Pen.

D. Mackinnon & Co., 192 Broadway, New York, makers. For a pen always ready for use this has no equal. It will write 75 pages of foolscap with one filling, and does away with the use of ink-bottles, and the annoyance of frequently dipping the pen in ink, as is the case with an ordinary gold or steel pen. The point is made of iridium, and is guaranteed by the manufacturers to last forty years, and is kept in perfect order for three years free of cost. It may be carried in the pocket without any danger of breaking, as it is furnished in a gutta-percha case and gold mounted chased tops. Price $5.00. We will present it for a club of 6 subscribers.

Literary.

ART IN THE HOUSEHOLD.

MODERN decorators and artists cannot endure *imitations* of any kind; but if those who cannot afford to purchase the genuine articles choose to exercise their ingenuity by making things which are pleasing to the eye and will render their homes more attractive, I do not see that their tastes will be lowered thereby. Even a crude imitation shows an appreciation of the beautiful, and 'tis more to the credit of a farmer's daughter in a remote part of the country to make her rough surroundings as pleasant as her innate taste and love of color and form impel her to do, than for a favorite of fortune and leader of society to influence "the styles" by her fancy for some particular kind of old china, antique furniture or "bric-a-brac."

Amateur artists have employed themselves in imitating the Limoges ware. Vases of simplest form, and without handles, are most suitable for this style of decoration, and, as the surface is to be completely covered it will not be worth while to buy those of the finest grade of terra-cotta. The coarser ware is more frequently made in forms most suitable for this work. A small cylinder jar will be a good thing to experiment on, before more elaborate and ambitious attempts are made.

The jar (or vase) should be rubbed with fine sand-paper, brushed carefully to remove any dust after the rubbing, and then well coated with linseed oil, and allowed to stand until the oil has been absorbed by the porous surface. When it is well "dried in" prepare your colors for painting. White or delicately tinted flowers are most pleasing on these vases, and the general tone or ground color used—and against which the flowers make best contrast—should be slate-grey indigo, or olive shading to darkest brown. The color generally shades darkest towards the base of the vase, and on the upper part. If dark tints are used on those portions where the white or brightest flowers are to be painted, and the lighter shades against the shadowed portions of the flowers and leaves, it will throw out in bold relief, and be very effective. The colors used in this work are the tube oil paints, and they should all be mixed with turpentine instead of oil, as they will dry more quickly and work more easily; and when the vase with the ground color on it has been set away in a warm closet for a day or two, so as to be perfectly dry, it should receive a coat of carriage varnish. Use a flat brush for this, turning the vase and coating it rapidly horizontally so that the varnish will not drip or run down and settle in drops at the base. This varnish should be allowed to dry thoroughly before the flowers are put on, and the flowers should be painted in broad, sketchy style, with strong lights and deep shadows. When the flowers have become quite dry the whole vase should be rubbed with powdered pumice-stone, applied by a soft linen rag, moistened slightly with water, then after wiping it off with clean, soft cloth the bright lights should be touched up again and a coat of copal varnish should be given. Perhaps a second coat of the copal varnish will be found necessary after a few days to produce the effect of a brilliant glaze, such as the Limoges ware has. Articles ornamented in this style will not hold water, as the moisture penetrates, and ruins the painting on the outside.

Transparent paintings produce an excellent effect on lamp shades, on lamp screens, etc, especially under artificial and transmitted light. The appliances, tools, and materials required are oil or moist water-colors in tubes, a set of flat and pointed brushes, gold drawing pens, and pencils of various degrees, of hardness, pieces of strong and evenly woven muslin, and a stretching frame of wood. The further requirements are a supply of the best white gelatine, of powdered gum arabic, and pumice stone.

First the muslin has to be prepared for painting by fixing a piece of the required dimensions in the stretching-frame, and sizing the surface with a solution of gelatine in hot water with the aid of a flat and moderately stiff brush. The first coat of gelatine is then allowed to dry, and the muslin restretched to receive the second coating, which is generally sufficient, although in some cases three or more coatings may be useful. After the coated muslin is perfectly dry the surface may be rubbed gently with a piece of pumice-stone to make the pencil-marks, the pen drawings, and the colors adhere better.

The outlines of the painting can then be drawn with a pencil direct on the muslin, and afterwards traced out with pen and ink. This, however, has to be done very carefully, as mistakes can only with difficulty be erased or corrected. The safer plan, is, therefore, to sketch the outline in ink first on a piece of paper, place the latter under the muslin, and from it trace with pen and ink the sketch or pattern to the woven surface.

The frame is then placed on an easel in a slightly slanting position, and turned against a window or against a source of artificial light, such as a gas or an oil lamp. For judging the effect of the color on a lamp shade, artificial light for working is preferable.

Before using the oil colors they must be diluted with a medium, which can be bought ready prepared, or made of turpentine and siccatif in equal parts. This makes the colors more transparent and prevents their running.

Moist water colors can likewise be employed after having mixed them with gum water, but they are less easy to handle for transparent paintings on muslin than oil colors.

The general rules for transparent painting, are, of course, the same as for any other kind of painting, but the following special hints may be found useful:

Leave untouched those parts of the sketch which are to appear white, or in a strong light.

For laying grounds, skies, and all large, flat tints, use a brush called "dappler," or better, even, a bit of fine sponge.

For mottled tints and pale foliage, the sponge device will answer equally well.

Another expeditious plan to produce the effect of heavy foliage and foreground is to cover the surface with a comparatively thin layer of green, and pick out the lights with a knife or with a pointed piece of wood. The required details can be painted in afterwards with a pointed camel-hair brush.

Balls of cotton wool covered with pieces of soft silk can be likewise used as dabblers instead of sponges, only a separate ball must then be kept for each color, whilst brushes and sponges can, and ought to be cleaned with soap and warm water.

CORRESPONDENT.

A VISIT TO THE ALBANY PENITENTIARY.

I had formed the opinion that prisons were all dark, damp, dirty places, and was therefore pleasantly surprised at the exterior, and interior of this one.

The building stands on a hill, in front of the structure is a beautiful sloping lawn; the grounds are large and well kept. Immediately in front of the building and on either side of the avenue is a number of handsome old trees, and in front of the entrance is some well arranged beds of choice plants.

The building is large and constructed to form a hollow square. It is painted a light yellow, which gives it quite a cheerful appearance. The square or court inside is fresh and green with a fountain playing in the center.

The cells, in spite of light, air and cleanliness, are damp and cold, owing, I presume, to the prevalence of iron and stone in the construction. The walls are all glitteringly white with white-wash and all the wood-work—even in the work-shops—looked clean enough to eat from.

The bedding of the men is of some dark-colored material and during the day hangs up against the wall. In the women's cells, however, the narrow beds are neatly made and covered with a light spread and the pillow-cases looked as smooth and white as if newly put on, although it was Friday. There were many little pictures and ornaments on the walls of the majority of the women's cells, but I noticed that few of the men's cells were so ornamented.

One large room contains twenty bath tubs, with a cold and warm water faucet to each tub, and once a week, every prisoner is required to take a bath.

In the kitchen and bake-shop, order and neatness prevailed. Rows and rows of large, nicely browned loaves of bread that smelled as if delicious, had just been taken from the oven, large tables held stacks of the tin-pans and cups in which the prisoners receive their food. A number of women were sitting on benches paring potatoes. As the immense range was red-hot and the day very warm, I thought it would have been more humane to have allowed them to sit farther back, for they were quite close together and facing the range.

In the work-shops the men were working under contract making shoes; in one shop they were making boxes in which to pack the shoes. We were shown specimens of the convicts' work; the shoes were as handsome, fine and well-made as any I had ever seen. One man does not make an entire shoe, but each one does a certain part of the work. When one part is finished it is passed on to some one else, perhaps into another shop. I have forgotten the exact number of shoes made in a day, but I think it was several thousand.

It was impossible to form an opinion of the prisoners, for they all sat with their backs to us, and the prison rules forbid them looking up, or around when visitors enter. Should a prisoner be at work in a room which you enter, or you should meet one, he will immediately turn his back to you, clasp his hands and bow his head until you have passed out of sight and hearing.

The men's faces are cleanly shaven and their hair closely cut. Their dress consists of a coarse, white cotton shirt, a pair of coarse grey pantaloons, a blue, cloth jacket and a round sailor cap of the same material as the jacket.

The women are allowed to retain their hair and arrange it to suit themselves. Their dress is of dark, red calico, high in the neck, and short in the sleeves for warm weather. Some few wore aprons and some handkerchiefs around their necks. In their workshops they were employed with sewing and various other feminine occupations.

There were few women, compared to the number of men, and I noticed quite a number of colored prisoners of both sexes. Two colored female prisoners had toddling babes with them, and the little things looked healthy and happy.

The gentlemanly official who accompanied us, gave us some interesting statistics of the prisoners and their labor, but I have forgotten most of them, or I might give them here.

In general, the prisoners obey the rules readily, and the officers have very few punishments to inflict, for aside from the fear of punishment, they understand that good behavior and obedience to the rules will shorten their term, and to a man confined in prison, one day off his term is something.

This is a United States Prison, and there are convicts from many states confined here.

Prisoners cannot see any one—outside of the officials—until they have served thirty days; then they may see their friends for a short time. They cannot write but once a month, and then only one letter. Friends may write when they choose, as the prisoner's receive their mail every Sunday morning. Friends may also send anything in the line of eatables once a week.

I had almost forgotten to mention the chapel and hospital. The former is a large well-lighted, and well-ventilated room or hall, with a seating capacity of about a thousand. A large platform held a pulpit and an organ, and when we were there, the room was nicely decorated with flags, etc.

In the hospital the rows of beds were clean and fresh. Only a few beds were occupied. One poor fellow was propped up in a chair, evidently in the last stages of consumption.

In this portion of the prison there is a library from which the inmates of the hospital have free access; others who wish may obtain one or two books once a week.

The work-shops are light and airy, none of the men looked overworked, and altogether we came away well impressed with the strict, yet humane management of this prison.

Not many years ago I visited a prison in a large city in this State, where all of the officers or guards in the workshops carried a small "cat-o'nine-tails," and the men looked sullen and rebellious, but I saw nothing of the kind in Albany. MRS. W. V. A.

JUDGES AT AGRICULTURAL FAIRS.

THE ideas that govern the action of some judges at our fairs are, to say the least, very original. I remember a case where there were two articles of the same kind exhibited; one was the work of an old lady, the other of a young farmer's wife. The old lady's article took the premium, but was so manifestly inferior to the other that the awarding committee felt called upon to explain in this wise: "The other piece ought to have taken the premium, but the exhibitor of this is an old person and probably will never compete again, and we thought it best to give it to her." Yet according to the rules of the society the names of the exhibitors should not be known to the judges. On another occasion a certain committee refused to consider an oil painting exhibited among others because it had no frame. "Very well," said one of them, "I am not acting on picture frames and you can proceed without me." This brought the matter before all in a different light and they went about the duty properly to which they had been assigned.

Exhibitors often lose sight of the real object of a fair. I heard a man remark to his wife once, as she drove up in front of the vegetable room, "Sarah, there are larger beets there than ours and maybe I had better not take ours out at all." Looking at the dollar he expected to get for his beets, he forgot that mutual improvement by the exhibition of one's best specimens is one great object in holding fairs. Many have a jealousy of those who do take premiums and will say: "O, there is no use in taking anything to the fair. This one or that one is always sure to take all the prizes."

Notwithstanding all the small drawbacks nothing ever drew the hard-working farmers into as close good feeling for one another or brought as many congenial people together and brightened as many lives as these same agricultural fairs. About so much humbug will exist in everything, and probably there is as little in a country agricultural fair as will be found in any other institution of its size.

B. C. D.

FASHIONS.

Marigolds are now the fashionable flowers in London. First the daisy, then the sunflower, next the lily and now the marigold. It is time the hollyhock was brought into service; no one seems to have remembered that old-fashioned flower.

Among the newest trifles in jewelry are the microscopic watches attached to the neck by a serpent coiling upon the skin. Grecian necklaces composed of five rows of variegated pearls with diamond clasps, and arrows, which are again worn in the coiffure and corsage.

A decorative and at the same time useful disposition of a painted tile is to insert it in one of the little wooden baskets especially made for the purpose.

Ladies addicted to art embroidery prepare themselves work aprons of pongee silk. A breadth of silk gives sufficient width. The lower edge is embroidered in silks and crewels, with simple flowers, as violets, buttercups and daisies in groups, and fastened down, forming pockets five or six inches deep.

Alligator-skin belts are in style.

Sets of door furniture in Egyptian style—handle, pull-bell, knocker, and letter-plate—are being made for large houses in London.

FIG. 431—THE COMET DRESS.

"It's an ill wind that blows nobody any good," so the oft thought instigator of trouble has benefited the ladies by setting a fashion.

SANITARY NOTES.

IN cases of dysentery be careful that outside air does not reach the body directly. Bind a piece of flannel over the bowels.

BEDROOMS and bedding should be well aired every morning. At night one or more windows should be lowered to allow the fresh air to enter, and foul air which rises, to pass out. Health depends much upon these observances.

A BASIN containing chloride of lime or a solution of carbolic acid (a teaspoonful of acid to a quart of water) should be kept in a room where contagious disease exists, or in fact anywhere that impurity of air may be known to be.

IN the selection of wall paper the subject of health is not as often brought to bear in the matter as the idea of beauty and suitableness. But since the discovery of so much poisonous matter in this article of adornment, it is but right to consider the result of an indiscreet selection.

QUESTIONS

A forcible answer to which will be found by turning over the leaf.

1. What rural paper has no axe of its own to grind?
2. What rural paper has the best contributors in the land?
3. What rural paper gives 500 original illustrations per year?
4. What rural paper conducts an Experimental Farm in the interests of its readers?
5. What rural paper places the interests of its patrons beyond its advertising patronage?
6. What rural paper tests all new seeds and plants, and renders impartial reports thereupon?
7. What rural paper is the farmers' friend and conscientious adviser?
8. What rural paper should all progressive farmers subscribe for?

EXPLANATORY NOTE.

We have decided it best, in this special issue, to waive the usual custom of publishing a story in the literary department, as space is limited. An installment would not be of interest to transient readers, and we feel sure that our continuous patrons will bear with the omission. Magazine, Book Notices, &c., are also omitted. In the issue of Sept. 10 or 17 a serial will be begun entitled "Thorns and Roses."

ITEMS---ALL SORTS.

In the depth of the sea the water is still; the heaviest grief is borne in silence; the deepest love flows through the eyes and touch; the purest joy is unspeakable.

To protect one's-self against the storms of life, marriage with a good woman is a harbor in the tempest; but with a bad woman it proves a tempest in the harbor.

Learning by study must be won,
'Twas ne'er entailed from sire to son.
—Gay.

The British Museum has purchased a vaulted wooden Egyptian coffin, well preserved, and a gilded mask and mummy of a lady named Talmtisa or Thothsi, one of the court or family of the Queen of Amasis I.

There is no place in the wide world like home. It is the dwelling place of our heart's treasure, and the first duty of our lives we owe to it and its inmates. To make it pleasant and attractive should be the aim of every man.

Gifts.—The best thing to give your enemy is forgiveness; to your opponent, tolerance; to a friend, your heart; to your child, a good example; to your father, deference; to your mother, conduct that will make her proud of you; to yourself, respect; to all men, charity.

There is a sound reason why there are bones in our meat and stones in our land. A world where everything was easy would be a nursery for babies, but not at all a fit place for men. Celery is not sweet until it has felt the frost, and men don't come to their perfection till disappointment has dropped a half-hundred weight or two upon their toes. Who would know good horses if there were no heavy loads?—*John Ploughman.*

Many years ago a New Zealander, who had been a cannibal, but who had been brought under the influence of Christianity and become a missionary, was staying in England in order to give an account of his work. He was one day entertained at a public breakfast, and was under the wing of the bishop of the diocese, who thought the distinguished guest surveyed the feast with much indifference if not some contempt. Just as grace had been said there came up to the bishop a sleek and very portly clergyman. With a fine roll of his eye, the converted cannibal turned to his neighbor at table and smacked his lips with the keenest appreciation of the probable flavor of his reverend brother. So true is it that we always come back to our first love.

Curious Statistics of Marriage.—It is found that young men from 15 to 20 years of age marry young women averaging two or three years older than themselves, but if they delay marriage until they are 20 or 25 years old, their spouses average a year younger than themselves; and henceforward this difference steadily increases, till in extreme old age, on the bridegroom's part, it is apt to be enormous. The inclination of octogenarians to wed misses in their teens is an every-day occurrence; but it is amusing to find, in the love-matches of boys, that the statistics bear out the satires of Thackeray and Balzac. Again, the husbands of young women, aged 20 and under, average a little above 25 years; and the inequality of age diminishes henceforward, 'till, for women who have reached 30, the respective ages are equal. After 35 years, women, like men, marry those younger than themselves, the disproportion increasing with age, 'till at 55 averages nine years.

AS A MEASURE OF ECONOMY!

Gossiping.—Tale-bearing and idle gossiping is, under all circumstances and by whomsoever indulged in, a most unprofitable and disreputable business; but when it assumes the form of malicious slander, it at once becomes a crime, even though the poisonous darts are so shaped that the strong arm of the law may be unable to protect or redress the wrongs of the ones thus injured.

Never choose for a friend one who would urge you to pull out a single thread from the warp of character. Never choose a friend that you feel you have lowered your standard of purity and right one single inch to gain. If you cannot step up in your friendships, you need not step down. Raise your standard and stand by it. You need not want for companionship; only see that the society is kept high and pure. Keep a strict watch at all the doors, and what a blessed thing it will be to live even amid outwardly adverse circumstances.

Most people when they cum tew you for advice, says Josh Billings, cum tew have their opinyuns strengthened, not conrekted. Take the selfishness out of this world, and thare would be more happiness than we should kno what to do with. It don't show good judgment to be surprised at enny thing in this world, for thare iz nothing more certain than uncertainty. Every man thinks that hiz nabor iz happier than he iz, but if he swops places with him he will want tew trade back next morning. A coquette in love iz az silly az a mouse in a wire trap; he don't seem tew kno how he iz agoing to get out. All fights to produce enny moral advantage should end in victory tew one side or the other. Yu will always see dorgs renew a drawn battle every time they meet.

Civility and Ceremony.—Nothing is more honorable and pleasant than civility, and nothing more ridiculous and burdensome than ceremony. Civility teaches us to behave with proportionate respect to everyone, according as their rank requires and their merit demands. In other words, civility is the science of men of the world. A person of good address, who conducts herself with due circumspection, conciliates the love and esteem of society, because everyone finds herself at ease in her company; but a ceremonious woman is the plague of her acquaintance. Such a one requires too much attention to be a pleasant associate; is too seldom satisfied with what is paid her, and every moment feels her pride hurt by the want of some frivolous etiquette. You cannot be too formal to her, nor she dispense with her formalities to others.

Baroness Burdett-Coutts is usually accompanied by a beautiful colley dog, which is a gift from Mr. Henry Irving, and which has a little history. The actor was one day driving over the Braemar moors, when he lost his Skye terrier, which had been trotting along behind his trap. He got down to look for it, directing the driver to go on with the trap. On the moor he met a shepherd with a colley and the man, when told of the actor's loss, offered to find the terrier. At a word from him the colley darted off, and after an absence of ten minutes returned. "Where is he?" asked the shepherd, and the dog, lifting one paw pointed in the direction of the road. "He has gone after the trap," the shepherd said, and Mr. Irving marvelling, and, in truth, incredulous, returned to the road, and coming up with the trap, found his little favorite awaiting his arrival. He bought the colley at the moderate price of fifteen guineas, and on his return to town, presented it to the Baroness.

Every farmer, gardener, stockman or fruit grower should read the Rural New-Yorker. Its teachings are practical, and it employs the best writers in the world. Ask those who know. It is for the North, South, East and West. It is the only National Rural Journal in America—the only journal that conducts experiment grounds in the interests of its subscribers. It has never in any instance sold seeds or plants to its subscribers, and its advice is disinterested. All new seeds and plants are tested as soon as introduced, and impartial reports made of their value without any regard whatever to advertising interests.

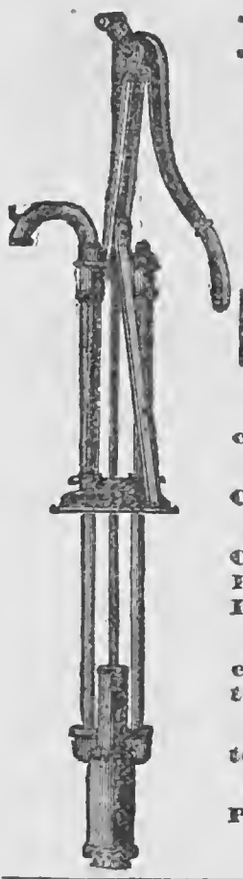
Mast, Foos & Co.
Springfield, O.
Manufacturers of the



NEW BUCKEYE
FORCE
PUMP

Works easy, throws a constant stream.

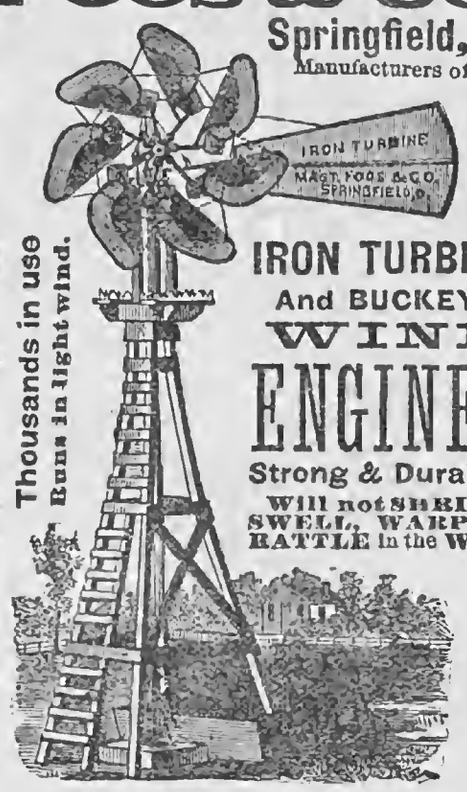
Has Porcelain Lined Cylinder.

Is easily set. Is the Cheapest & Best Force Pump in the world for Deep or Shallow Wells.

Thousands in use in every part of the United States.

Never Freezes in Winter.

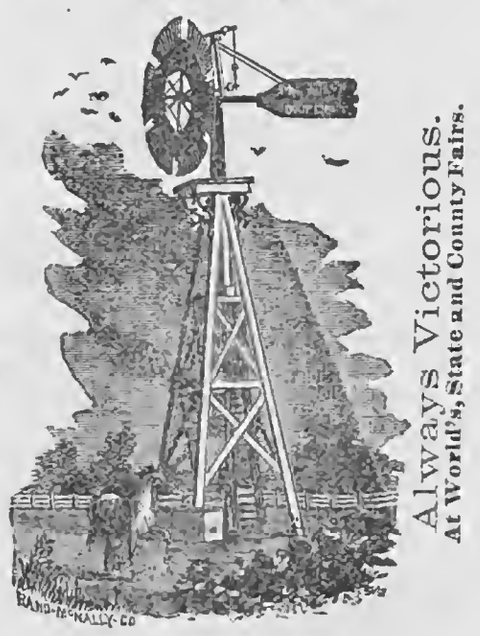
Send for Circular and Prices.



Thousands in use
Runs in light wind.

IRON TURBINE
And BUCKEYE
WIND
ENGINES
Strong & Durable.
Will not SHRINK, SWELL, WARP, or RATTLE in the Wind

Halladay Standard WIND MILL.



26 Years in Use.

Always Victorious.
At World's, State and County Fairs.

GUARANTEED SUPERIOR
TO ANY WIND MILL MADE.
17 Sizes—One Man to 45 Horse Power.

Adopted by the leading R. R. Co.'s and by the U. S. Government at Forts and Garrisons.
$3,500,000 worth Now in Use.

ENTERPRISE
WIND MILL.

Known and sold throughout the world and acknowledged The Best. Simple Durable, Strong. Few Joints. Frictionless Turn Table. Multiplying Ball Governor. All sizes for Rail Road, City and Farm Purposes. Every Mill Warranted.

Enterprise Feed Mills
New and startling. For Wind, Horse, Steam or Water Power. Climax Corn and Cotton Cultivators. Pumps, Tanks, &c. Send for *brown* Catalogue
SANDWICH ENTERPRISE CO., Sandwich, Ill.

IMPROVED CALIFORNIA WIND MILL.

Simple, Strong, Durable, Rosette Wheel and perfectly Self-regulating, avoiding 100 wearing joints. Also, Steven's Pony Feed Grinder and a perfect Rotary Motion attachment, without gearing, the power being communicated by the lift or up stroke of Pump Rod. Can be used for cutting feed, churning, &c. The best, cheapest and most useful power in the market. Full particulars, circulars, &c., sent free. Address the Manufacturers. CLARK & CO., Somanauk, Ill.

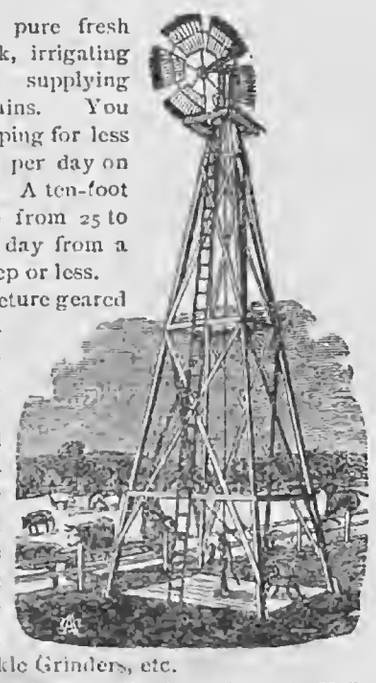
CHAMPION WIND MILLS.
Perfectly Self-Regulating.



Furnishing pure fresh water for stock, irrigating purposes, or supplying horses' fountains. You can do the pumping for less than five cents per day on the investment. A ten-foot mill will pump from 25 to 100 barrels per day from a well 100 feet deep or less.

We manufacture geared mills for running corn shellers, feed mills, feed cutters, churns, etc., and are manufacturers of the Star Wood Pumps, and Iron Pumps for wells and cisterns of any depth; Screen Doors, Boss Sickle Grinders, etc.

Sold by the trade generally throughout the U. S. Good reliable dealers wanted to handle our goods where we have none. Send for catalogue and prices.

POWELL & DOUGLAS, Waukegan, Ill.

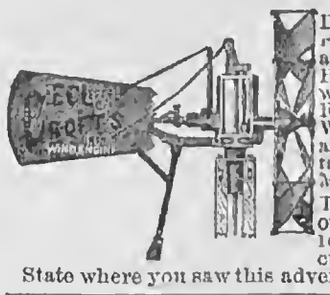
I. X. L. WIND MILL.

For Simplicity, Durability and Power *this mill has no equal.* It runs equally well in light or heavy winds. Ice and sleet do not effect it. Works well under all circumstances; never gets out of order. We warrant all our mills. Circulars and descriptive catalogues sent free on application to the Phelps & Bigelow Wind Mill Co., Kalamazoo, Mich.

CHALLENGE WIND MILLS
Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merits. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.
CHALLENGE MILL CO., Batavia, Ill.

THE BEST WIND MILL ON EARTH

Croft's Improved Iron Wind Mill,
MANUFACTURED BY
E. C. LEFFEL, Springfield, O.



Dealer in Pumps, Tanks Pipes, Corn Shellers, and Corn Grinders Power Converters, with both Lever and Rotary Motion applied Wind Mill Power, and also everything pertaining to Wind Engine Machinery.

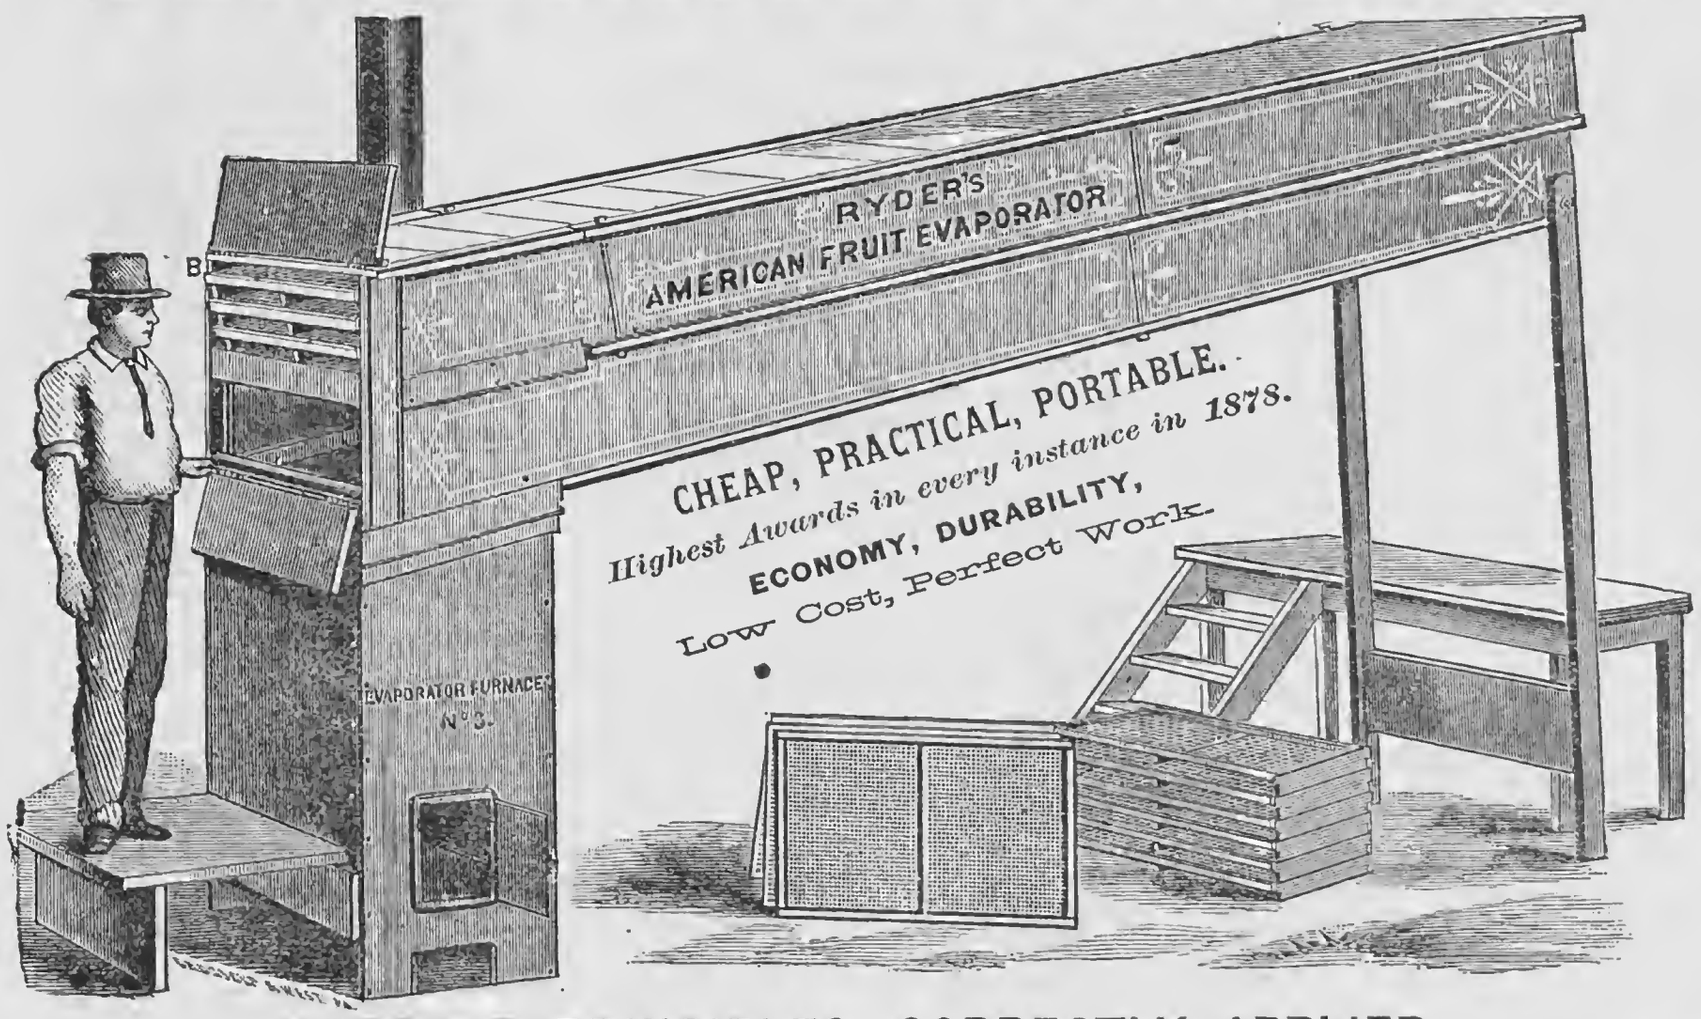
The American Fruit Drier.



CORRECT PRINCIPLES, CORRECTLY APPLIED.

Its product in color, flavor and selling qualities unexcelled. Original and radically new in fruit evaporation.

Some of the merits of the AMERICAN, and advantages secured by its patrons:

1st. We enumerate among other claims of the American Evaporator, certain advantages secured by purchasers, in addition to its acknowleged structural superiority. They have in our Fruit-Selling Department a comprehensive co-operative agency with mutual interests, in the sale of their product. Thorough uniformity of quality, value, package, trade mark and label, secured by our confidential circular to purchasers, and carefully sellected selling agents.

2d. That all our Evaporated Fruit is made by our patrons, and in securing best possible prices for them, we best advertise our evaporator, maintain the established reputation and price of its product, at small cost. We do not desire to make any considerable profit on your labor.

3d. It is the only original Inclined-Flue Evaporator, thoroughly protected by letters patent, and the only one which can guarantee protection and safety in its use against costly litigation, royalties and damages. See notice in catalogue of our claims.

4th. With it the individual farmer and orchardist can cheaply convert his surplus fruit into evaporated stock, equal in appearance and market value to that produced by the most thoroughly equipped and expensive commercial evaporator.

5th. No farm implement will pay its cost so quickly, or so many times in a season; always ready, the daily wasting fruit suggesting its use and reminding us "It is not what we make, but what we save that accumulates wealth."

6th. Owing to the universal practice of sun and oven drying of fruit, the market for that kind is overstocked and it does not pay, while choice evaporated fruits always command good prices.

7th. Strong currents of Dry Hot Air, automatically created, pass so rapidly through the *Inclined Flues*, precluding the possibility of discoloration, and account for the fancy work it does.

8th. Each tray (or group) first receives the direct and greatest heat. 2d. Each subsequent tray (or group) takes its place, and puts former one out of danger. 3d. It is almost impossible to burn the fruit in continuous working.

9th. Its evaporating capacity per tray surface and for its cost is unequaled. 2d. It will produce a handsomer, brighter-colored and a more valuable product than any other portable evaporator. Illustrated Catalogue free.

Miscellaneous.

AN INSURANCE STORY.

JAMES FERGUSON AND DEACON JONES.

An intelligent, quick-witted farmer, about thirty years old, was James Ferguson. He owned a hundred acres of land nearly paid for, and had a snug set of buildings on the farm. Deacon Jones was his neighbor, sixty-five years old, possessed of rare judgment and shrewdness, which qualities had brought him prosperity in the way of broad acres. He owned three good farms beside the one he lived on; a married son and daughter lived on two of them and a tenant worked the third.

The Deacon's judgment was greatly respected by all who knew him, and especially by Mr. Ferguson. The genial old gentleman always welcomed James to his house, and when asked, would discuss any matter of business with him or give such advice as a father would to a son. This kindliness on his part, had already saved James from embarking in two or three bad business ventures. Not three months before the conversation occurred which we are about to relate, James asked him for advice in buying a patent right an agent had recommended in glowing colors. The Deacon soon convinced James that agents only represent one side of a question, and persuaded him to look at the other side of this one for a while. Then he brought out his slate and pencil and set James to figuring expenses and loss of time and cost of patent, and soon showed him that the profits were too visionary to be depended upon.

In truth, the Deacon had a very shrewd way in his discussions. First, he would allow a man to tell his own story to suit himself, and then by a series of questions and suggestions, lead him along until he had involved himself by admitting sufficient to overthrow his own theory. A few words then from the Deacon, clinching all the points that had been made, would usually conclude the discussion, with the man convinced against himself.

At the time of which we write, in the latter part of October, 1879, a good deal of discussion occurred in the neighborhood about fire insurance. A young man from a neighboring town had lately held a meeting at the school-house, and made a speech full of tinkling words and sounding figures, urging the farmers and others to join a Mutual Insurance Company recently organized in the county. He told them of great profits made by stock companies. He pointed to the reports of a few such companies that were rich, and claimed their wealth was made by exorbitant charges for insurance. He figured that the farmers could save many thousand dollars by joining his company, formed on the Mutual plan, and did not conclude until he had shown, in his own estimation, that insurance as conducted by these companies, was little less than downright robbery.

Ferguson and the Deacon were both at the meeting. The former was deeply impressed by what the young man said, and went home about resolved to place his insurance in the proposed company.

The next night he visited the Deacon, to see what he had to say on the subject. After the usual greetings, the discussion of the weather, and the prospect of the prices of wheat, of which both had some to sell, James broached the insurance question, by saying he was a good deal interested in the address of young Jones, and asked the Deacon what he thought about it.

"Well," said the Deacon, "I thought he was pretty wordy and smart, but I was not convinced as to the soundness of his arguments."

"Why," said James, "I thought they were very strong and convincing."

"What arguments, James, struck you so favorably?" asked the Deacon.

"Why, the whole speech," said Ferguson. "He showed how the farmers of this county could save thousands of dollars, by a Mutual Insurance Company. You know he told us that some companies made $20,000 a year, and some make even more. That they report having millions of dollars assets, and they make it all out of us farmers and others. Besides, they pay their officers great salaries for doing almost nothing at all. It is too bad, Deacon, that they should gouge us so, and I feel that we ought not to stand it, don't you?"

"No," replied the Deacon very quietly, "I was not convinced by what he said that I had been much cheated by the companies that insure me. I have never yet paid as much for the insurance of my buildings as I should want to charge another person, if I were to be the insurer. It seemed to me while this young man was talking that he dealt too much in general statements, and did not come down to details. You seem also to be running off in the same way. I guess I will bring out my slate and pencil, for we will want to do some figuring before we get at the bottom of this thing."

Now James knew that the Deacon seldom decided any business question without first consulting his slate and pencil. His discomfiture in the patent right question a few weeks before had all come through those little figures which the Deacon had so carefully made, and added and subtracted on his slate. But he too had brought a memorandum, taken at the speech, of the figures which the young orator had liberally given. They were all large ones, running up into the thousands and even millions of dollars. They wore a very formidable look, and he thought they could not be answered, so he was very glad when the Deacon got up, went to his desk, and getting the slate, drew out a table, put on his spectacles, and asked James to come up and prepare for details.

"Now, James, you say some of these companies have made $20,000 and more a year, out of the farmers and others that they insure."

"Yes, Deacon, their reports say they did, and the lecturer said that these reports are sworn to by the officers."

"Well, that is a good deal of money to make in a year," said the Deacon, "or it would be if one man made it all, or it was all made out of a few men. We will put that down here in this corner, against the companies. Now how many men were insured, out of whom all this money was made?"

This was an unfortunate question for James. The young orator had not told them, and he had not thought of it before; so he was obliged to answer that he did not know.

"You see," the Deacon continued, "if there were 20,000 men insured, then it was only a dollar made from each one, and this was not a very great robbery. If they had 40,000 men insured," said he, after figuring a little, "it would be only fifty cents a year, and I don't believe they ought to take the chances of 40,000 risks at much less profit than this on each. I remember inquiring once at the office of a company that insured farmers in a good many States, and they told me they issued very often 50,000 policies in a year. I suppose some issue more, some less, but anyway, it is evident that when you bring the figures down to each one of us, they will not show such evidences of extortion as they appear to in speech.

"But $20,000 would be a great deal for one man to make, even if he made it from 40,000 people. Now did the young man say whether these companies were any of them owned by one man, or how many were interested in them?"

"No, he did not," said James, very much chagrined that he had not thought to ask.

"Then I do not see," said the Deacon, "as we have got much figuring to do on this part of our subject; he didn't furnish us much data to work from. If, as I suppose, there are one or two hundred stockholders in these companies, it would only give each one a profit of from $75 to $200 apiece, and that will not make them rich very fast, will it?"

James had to assent to this proposition, and felt that his line of argument was being rapidly demolished by the Deacon's mode of coming down to details. So after a few minutes, thought he remembered another point.

"Why, Deacon," said he, "you needn't tell me that these stock companies have not made more money than you talk about. They have got millions and millions of dollars, and they have made it out of the insured, too!"

"Hold on there, James do not go too fast," said the Deacon. "Let us look into that a little. It is true they have in their hands a great deal of money, but it is not true they have made it out of the insured. In the first place, to form one stock company, under the laws of our State, the men interested have to pay in at least $200,000, and some of the companies have one or two millions of dollars thus paid in by the owners. This money is called the Capital Stock, and is all paid in by the stockholders, before a policy is issued. That part of the money owned by the companies, called their capital, has not been made out of the insured, for it was in the company before the insured paid a dollar. Then you will notice another thing; you see we pay our insurance in advance—one, three, or five years. Now the laws of this State say that this money which we pay in, does not belong to the company at all, for the company has not yet earned it. They must hold it in trust until the policies run out, and pay all the losses we may have while they run, before they can call it theirs. All this money is called a liability against the company. It is a debt, just the same as money deposited in a bank is a liability against the bank. This fund, called the unearned premium fund, amounts to many hundred thousand dollars in each company's hands, and if any company should stop issuing policies, so as to stop more of this money coming in, they would at once begin reducing it, by paying the losses as they daily occur, on policies not yet expired. This would continue until every policy ceased by limitation, and I am confident it would use up a large part of this fund.

"Now, if you should add this debt for deposits to the capital paid in by the stockholders, you will see that the companies lack a great many million dollars of having made out of the insured, all the assets they report on hand."

"Why, Deacon," said Ferguson, "do you mean to say that these companies are not rich?"

"Certainly not, James; they are rich, as they should be, to have our confidence. We depend upon them to help us, if calamity befalls us; we pay our money to them for insurance for years to come. The stockholders put their money into the company as they do, to win our confidence so we shall put ours into it also, and thus create a large fund to pay losses with when these occur.

"Now, James, tell me who you think has the first claim on the money these companies possess—is it the stockholders who furnished the capital, or the men who have losses under their contracts or policies?"

"Why, I suppose the losses that occur are debts, and the law will protect the creditor before the stockholders."

"Yes, that is true. If losses should come heavier than the company expected, so as to exhaust all the money we paid for insurance, then we could call upon them for the capital until every dollar of this was exhausted. This has occurred many times, and the result was that the stockholders stood by and saw all their money go to this purpose, leaving them without a dollar of their investment. Would you like to invest any money in this way?"

"Well," said James, after considering a few minutes, "I might, if I got large enough dividends."

"That is well said," replied the Deacon; "now, I notice very few companies pay over ten per cent. dividends on the money or capital they invest—many pay less. As this at the best is only three or four per cent. more than they could get by investing their money in good mortgages where they could not lose it, I do not think it a very tempting business. Business, where a man stands a chance to lose all his money, ought to pay a better profit, or interest, or dividend, than business that has no risks in it.

"Suppose a man came to me, and told me he had five thousand dollars deposited in a bank, and offered to make a contract agreeing that if my property burned up within the next three years, that money should be mine, and that all he would ask in return, was the interest the money itself earned, and three or four per cent. besides? I should consider his offer a very liberal one indeed. More than that, I would not want to change my business for his—would you?"

"No," said James, "but do you mean that is the way insurance companies do?"

"Certainly; only a stock company consists of perhaps some hundreds of men instead of one man, each one putting in such sums as they see fit, and they insure thousands of men, thus taking thousands of risks instead of one only. I don't think it a very safe business."

"I agree with you," replied James. "I have worked hard for fifteen years and made a few hundred dollars. I should hate to put it into such a speculation, even if I were sure of the ten per cent."

"Why not?" the Deacon asked very quietly.

"Oh, because I should worry over the chances in the business. Your house might burn to-night, or John Smith's to-morrow night. Some people are awful careless, and then lightning strikes when any little thunder shower comes up. The uncertainty would make me nervous, and even if I drew a little extra profit two or three years, I should all the time be afraid of losing all I invested."

"Do I understand you, James," said the Deacon, "that you do not think that the chance of making a little money would be any temptation to you to risk losing a good deal?"

"That is just what I mean, Deacon. I am going to take care of my money, and take no chances. Let other men take their chances if they want to—I won't!" and he brought his fist down with a great deal of energy on the table as he said so.

The Deacon dropped his head as if in deep thought, and remained so some minutes. At last Mr. Ferguson, feeling that the conversation had been drawn away from the subject he desired to discuss, said:

"But that has nothing to do with the matter I wanted to discuss with you, Deacon. That is this Mutual Insurance Company. You see we pay a good deal of money to these companies to pay their agents and officers and clerks, &c., and as the danger of fire is very light we ought to save considerable by forming such a company, and then when one of our number has a loss we could all be assessed and pay our proportion, and thus avoid paying more than is absolutely necessary. Now what do you think of it?"

The Deacon did not make any direct reply, but began figuring.

"How much do you pay now, James, to the stock companies to be insured," he asked.

James considered a few minutes and then said:

"I pay $30.00 for every policy."

The Deacon wrote the $30.00 on his paper.

"How long does your policy run, James?"

"Three years."

The Deacon figured a few minutes and then, looking up, said:

"James, my policy runs out day after to-morrow, I can not see the agent until a week from that day to get it renewed. Now I want $3,000 insurance on my property for that week. I will give you five cents each day, if you will agree to pay me $3,000 in case I should lose so much. Will you do it?"

"Why, Deacon, are you crazy? I told you a few minutes ago that I would not take such chances. I don't know what you mean by asking such a question."

"Well, if you can not do that, I will make you another offer. You have got about the same amount of property to be insured that I have on my farm over on the cross-road that John is living on. Now, I will not pay you any money, but we will agree to this—if you burn up in the week, I will pay you your loss, and if I burn up, you shall pay me my loss."

"But, Deacon, I told you I did not want to go into the insurance business at all. Besides, your son has five children, and I have only one; he keeps a hired man and a girl—I keep neither; so that risk is a good deal more than mine. Why then should you ask me to take twice as much risk as you do? Even if I should consent, your own conscience would convict you of getting an advantage over me; I cannot understand, Deacon, what you are driving at."

"Simply this, James," said the Deacon, "I am having you argue your own way through the question you asked me about the Mutual Company. A Mutual Insurance Company is founded upon the principle that my proposition is founded upon, and which you so indignantly denounce. It is a fact that in joining such a company you go into the insurance business; you help insure all your neighbors who belong to the company, as well as every other person who is induced to join. You pledge your property—your farm—to pay a certain portion, not only of my losses, if I belong to the company, but of each and every member of the company. You said you thought ten per cent. dividend, to the stockholders of a stock company, was none too much for them to receive for their risk, and that even that dividend was no temptation to you. Yet here you put your whole farm in the pool and receive nothing in return in the way of dividends, and save but very little money indeed. Your farm is worth $5,000 in cash.

"Now, James, I have figured out a little sum here for you. $30.00 for three years is $10 a year, or 2½ cents a day. That is what you pay a stock company for laying aside $3,000 with which to pay you if your buildings burn any time in the next three years. You have no farther trouble about it—you know that if you burn, in sixty days or less, you will have your money in your hands to rebuild with. You do not feel alarmed about your neighbors' carelessness—you are not uneasy lest some of them burn—there is no lien on your farm; you paid your money and you have got your policy. Don't you think you had better let well enough alone?

"When I was a young man I felt as you do, and I joined a Mutual Insurance Company. We run very nicely for two or three years—we had some little assessments and thought we were saving money. But after a little we had a very dry summer, with a hot, showery August. Two or three dwellings burned during the Summer, and a couple of barns were struck by lightning and burned in August, just after harvest. We met in September to look the ground over, and found that to pay the losses for the Summer, would cost more than to insure in a good company for ten years. We paid our assessments, and went home, sadder but wiser men. We concluded that so long as two or three hundred insurance companies were soliciting our insurance, the competition between them would keep the price down as low as it could be done, and as we could get all the insurance we wanted at a price ranging from one-third of a cent a day for the small property owners, to five cents a day for the wealthiest men in our county, it was nonsense to go into the business ourselves.

"I made up my mind that when I wanted to go into the insurance business, I would buy some stock in some company, paying the cash for it, and let it take the chances. I have never seen the time I wanted to invest that way. I would never put my home or farm into a pool, and say to all the county, 'If you burn, here is my farm to draw on,' for I intend to do a farming business and let some one else do the insuring of all my neighbors.

"Now, James, it is time to go home. You are a farmer—stick to farming. Don't go into insurance or buy patent rights.

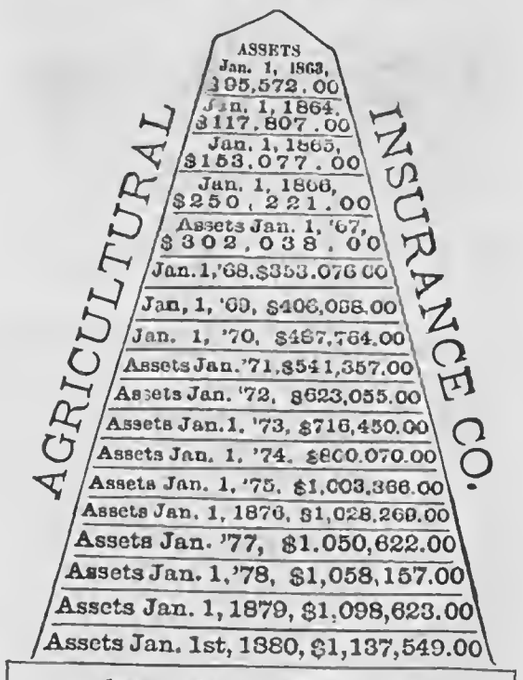
"One thing more, James, don't begrudge to other men, the little profits they may make in any trade you give them. If you want a wagon you had better let a wagon-maker make it for you, and make something on the trade, than try to make it yourself. If you want some sugar, you had better let the railroad bring it and the merchant sell it to you, each making a little profit, than to take your horse and drive to New Orleans after it. The railroad and the merchant will make a dollar or two, on all you will use in a year, but it is infinitely better for you to be digging away on your farm, raising the stuff to sell to get the money to pay them while they are getting it to you, than it would be for you to leave the farm to go after it.

"So with insurance. The companies that insure 40,000 or 50,000 farmers a year, will gladly do it at a profit of a dollar a year from each, and even for less. I am told they often do not make one-third of this. So on the average, all you will save by going into the business yourself, will be the few cents yearly that they make out of each man after paying all the losses that must arise.

"Keep your property insured—keep out of all entangling alliances—pay your debts and you will be happy. Good-bye, James."

And this was how it happened that James Ferguson did not join the Mutual Insurance Company.

PYRAMID
OF ASSETS OF THE



Assets January 1st, 1881,
$1,261,731.00

Capital, $300,000. Net Surplus, $201,092.58.

THE ATTENTION of Owners of farm property and residences is invited to the above Pyramid, showing the uniform and sure growth, during the last eighteen of its 28 years of existence, of a fire insurance company whose charter limits its business to their class of property—the **Agricultural Insurance Company**, of Watertown, N. Y. The figures represent the amount set apart at the dates given for the PROTECTION OF POLICY HOLDERS.

Twenty-eight years of patient toil has made this the strongest and largest Company doing an exclusive Dwelling Business in the United States, if not in the world. It now issues 55,000 polices a year. No other like Company can show such growth and increase.

The history of this Company proves that a LARGE business, well scattered, managed with prudence, *can be done with a very small profit from each risk*, and afford perfect security, which will grow stronger every year.

While nine-tenths of the "Mutual" fire insurance companies, and many of the Stock companies, have failed on account of reckless or extravagant management, or doing too small a business, the OLD AGRICULTURAL, by economy, energy and prudence, has every year added a substantial amount to its Assets, for the indemnity of its patrons, and it now occupies a position in the confidence of the public second to no other Company.

From year to year it spreads the base of its Pyramid and gains strength.

EXTRACT FROM CHARTER.—"*Article 2.* This Company is formed for the purpose of insuring Farmers' Dwellings, Private Residences, Barns and Outbuildings, with their contents, and other property not more hazardous," and is strictly confined to this class of property.

ABOUT WOMEN.

ROSA BONHEUR is 58 years old.

MISS SARAH P. MCLEAN, of Simsbury, Ct., is the author of "Cape Cod Folks."

THE late Countess Montijo, mother of the ex-Empress Eugenie, once kept a millinery store at Brussels.

EIGHT New York ladies, whose husbands are estimated to be worth $300,000,000, aggregate, dined together the other day at a Saratoga hotel.

THE QUEEN is now interesting herself as to the matrimonial future of the Prince of Wales' eldest son and the eldest daughter of the late Princess Alice of Hesse.

MRS. DOMINIS, a sister of King Kalakua, and the wife of an American shipmaster at Hawaii, acts as regent of the kingdom in her brother's absence. Kalakua has chosen her as his successor to the throne.

WHEN women are the advisers, the lords of creation don't take advice until they have persuaded themselves that it is just what they had intended to do; then they act upon it, and if it succeeds they give the weaker vessel half the credit of it; if it fails, they generally give her the whole.—Louisa M. Alcott.

THE marriage of the Duke of Argyll with the daughter of the Right Rev. Thomas Leigh Claughton, D. D., Bishop of St. Albans, at the Episcopal Palace, occurred in London, August 12. The bride is the niece of the Earl of Dudley.

[Wayne Co., (Ohio) Democrat.]

Mr. William E. Snyder of West Lebanon, Ohio, says: For some time past I had been severely afflicted with Rheumatism. Seeing an advertisement of St. Jacobs Oil, I procured a bottle, and I could feel the effect of the Oil upon the first application. I am now entirely well after using one bottle.—*Adv.*

THE OLD RELIABLE
Buckeye Force Feed

GRAIN DRILL.

ALSO

THE NEW BUCKEYE
Combined Force Feed Grain and
FERTILIZER DRILL.
AS IMPROVED FOR 1881.
Over 100,000 Now In Use.

The Buckeye has the largest sale of any Grain Drill in the world, and they are pronounced by all to be the most *perfect* SEEDING MACHINES in the country. No Grain Drill ever made gave such UNIVERSAL SATISFACTION. It is the best force-feed in the market. Our Fertilizer Sower has a positive force-feed and has no equal. Send for our circular giving illustrations of new improvements. Address P. P. MAST & Co.,
Springfield, Ohio.

Branch Offices, 216 N. Broad St., Philadelphia, Pa.
11th St. and Clarke Ave., St. Louis, Mo.

Also manufacturers of Buckeye Broadcast Seeders, Buckeye 11-foot Sowers, Buckeye Riding Cultivators, Buckeye Walking Cultivators, Buckeye Plow Sulky and Buckeye Cider Mill.

NEW BUCKEYE STEEL SPRING TOOTH

WHEEL HARROW AND CULTIVATOR.

Another improvement, another advancement in the right direction, another economical labor-saving implement, something that no farmer can afford to do without

Sold with or without Broadcast Seeding Attachment.

High Wheels, Broad Tire, Light Draft. The pressure on the teeth is regulated by the lever, and they can be set while in motion to run at any required depth. The teeth are made of the best spring steel. The ample space under the frame allows it to pass over obstructions readily. No implement made will so wonderfully work up and pulverize the soil or prepare the ground so admirably for the crops as the Buckeye Spring Tooth Harrow.

The New Buckeye Spring Pressure Grain Drill.

The best and most complete Spring Pressure Drill in the market. It embraces all the latest improvements of the age. Is so arranged with Steel Spring Drag Bars that any amount of pressure can be put on the Hoes with the Lever. It is supplied with guages, so that the grain is deposited at a uniform depth in either hard or soft soil. The Drag Bars arranged with a drop to allow the Hoes to follow the uneveness of the ground. It has the best Force-Feed in the market and a reversible Force-Feed Grass Seed Sower which can be put on to sow either in front or rear. Also

THE BUCKEYE SHOE PRESSURE OR RUNNER DRILL,

constructed on *scientific principles*, and we do not hesitate to recommend it to be the best Drill of the kind in the market. In addition to the improved shoe or runner and lever spring pressure, it has all of the improvements of the regular Buckeye Drill; also the old reliable Buckeye Grain Drill, the Buckeye Combined Grain and Fertilizer Drill and Buckeye Seeders—in other words the most complete line of Grain Drills and Seeders in the world. Send for circulars to

P. P. MAST & COMPANY, Sole Manufacturers, Springfield, Ohio.

Branch Offices, 216 North Broad Street, PHILADELPHIA, PA.; Corner 11th Street and Clark Avenue, ST. LOUIS, MO.

G. WESTINGHOUSE & CO., SCHENECTADY, N. Y.

TRACTION AND PORTABLE ENGINES,

Horse Powers, Grain Threshers,

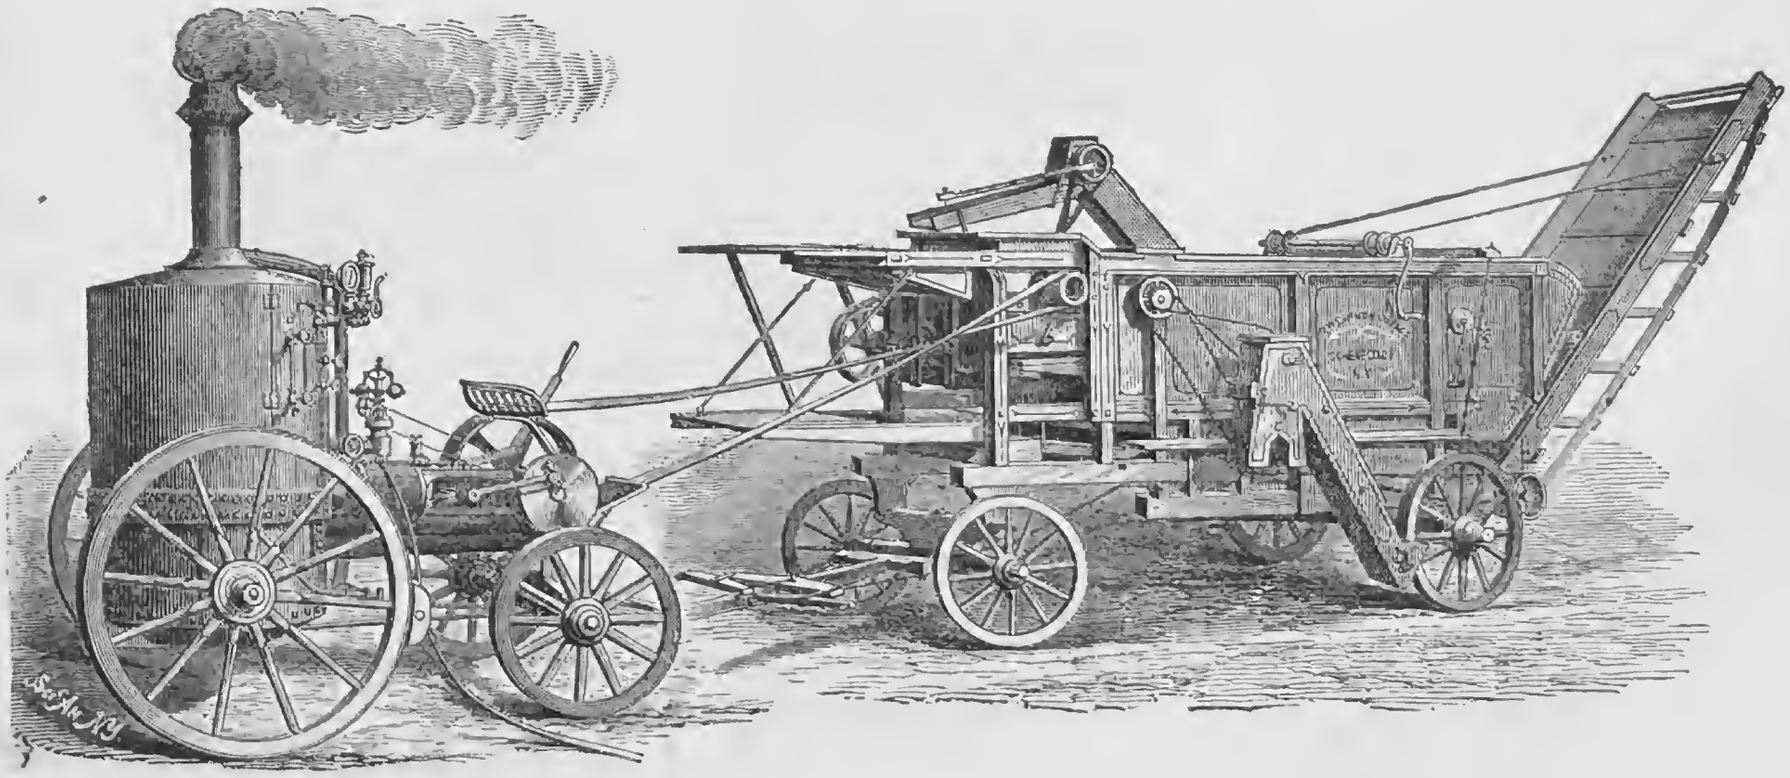
AND

Combined Clover and Grain Threshers.

Grain Threshers, unequalled in capacity for separating and cleaning.

Combined Grain & Clover Threshers, fully equal to regular grain machines on grain, and a genuine ***Clover Huller*** in addition.

Engines, positively the most desirable for Lightness, Economy, Power and Safety. Boiler has horizontal tubes, and is therefore free from the objectionable features of vertical boilers.



AGRICULTURAL NEWS.

The largest importation of pure-breed draft horses ever made into this country arrived here on the steamer City of Limerick, on Aug. 25, amounting to 200 pure-bred Percherons, the property of Mr. M. W. Dunham, of Wayne, DuPage Co., Illinois. One-tenth of all the Percherons that have ever crossed the Atlantic were included in this large shipment. A special train of 30 cars was engaged to carry the horses to their final destination, and on their arrival there Mr. Dunham tells us he will have on his two farms—one of 600 and the other of 2,000 acres—one-fifth of all the Percherons ever brought to this country. In the last 17 months he has imported 360 head of this distinguished breed, aggregating more than all the importations of all other draft horses combined. There is no breed of draft horses that has met with greater favor than Percherons in this country, especially in the West. They are from 15 to 18 hands high and weigh from 1,500 to 1,800 pounds. For heavy farm and road work, the city dray or truck, no horses ever imported have been superior to the larger class of this remarkable breed; while those of medium size are equally admirable for the express wagon, the omnibus or the street car.

The Cal. Silk-Culture Association (San Francisco) is pushing the raising of silk worms by distributing mulberry seeds, pamphlets, etc....The Chilians have just discovered two valuable deposits of guano—one on the Tortugas Islands, estimated at about 60,000 tons; the other in Ferrol Bay, about 40,000 tons; both first-class and worth about $6,000,000.....The Omaha Bee urges the passage of a law prohibiting the killing of prairie chickens for the next ten years. They are now being rapidly exterminated and the enormous increase of noxious insects in the West is doubtless greatly due to reckless pot-hunters.....The Illinois and Mississippi River and Canal Improvement Co., met at Chicago on August 25 and appointed a Committee to memoralize Congress in behalf of the construction of that canal westward from Hennepin, Ill., to the Mississippi. Hearty sympathy was unanimously expresed for the objects of the St. Louis River Improvement Convention which meets Oct., 26....The N. Y. Canal Board purposes so reimpose tolls on West-bound freight—a project that excites bitter opposition from shippers in this city.....Many Portugese laborers have been put to work on Louisiana plantations and a systematic effort is being made to induce immigration from Spain, Portugal and Italy to the Gulf States. Owing to scracity of labor, wages there have already risen and threaten to go much higher unless more laborers can be obtained from somewhere.....The Iowa Farmers' Protective Association, which is contesting the validity of the barbed-wire-fence patents, is encouraged by the discovery of a home-made barbed-wire fence put up, on the farm of Samuel Freeman, six years before the wire fence patents were obtained. They must not be too elated, however, as it has been decided that priority of invention does not invalidate a patent unless the invention has been introduced to public notice.

The recently appointed Treasury Cattle Commission have just issued a circular addressed especially to the governors of the States and Territories west of the Alleghanies, in which they call attention to the danger to which herds in those States and Territories are exposed from the traffic in diary calves brought from the infected district on the Atlantic coast, which the circular states extends from New York south to Washington. Those to whom the circular is addressed are requested to use their influenced in securing legislation forbidding or discouraging traffic in cattle from anywhere near the infected regions.....One of the largest importations of Channel Island Cattle ever made, has just been brought here by Mr. Burnett, Southboro, Mass., consisting of 174 Jerseys and 18 Guernseys.....At the same time Mr. Cooper, of Coopersburg, Pa., brought over 175 Oxford Down Sheep, among which were three pens that took premiums at the Royal show at Derby this year.....William E. Flinn's ranch, near San Diego, Cal., boasts a grape-vine which bore five tons of grapes last year and broke down an oak, two and a-half feet in diameter and sixty feet high, which supported it.

A HEAVY iron roller has been used at the Rural Farm for four years, at first upon sowed grain, but latterly before the grain is sown, the land being fitted for seed when sown broadcast by harrowing after the roller. We are of the opinion that the best use to be made of such rollers is to break up the lumps and pulverize the soil. A roller is a companion implement to a harrow, rendering its work three-fold more effectual. But the harrow should begin and end the work.

THERE can be little doubt that wheat drilled in is less liable to winter-kill than if sown broadcast. The seed is placed deeper and more uniformly so.

"Allow me to congratulate you on your harvest reports. Newspaper men agree that they are more reliable than those of the Department of Agriculture. To think of private enterprise beating Uncle Sam!"

T. H. HOSKINS, M. D.,
Ag. Ed. Vermont Watchman.

AGENTS WANTED.

MOSELEY & STODDARD MF'G CO., Poultney, Vermont.

$250.00 CHALLENGE $250.00
We offer above to any color that will excel
Mrs. B. Smith's Butter Color.
What we claim for our BUTTER COLOR is: 1, it has no taste or smell, and is as harmless as water. 2, it is liquid, is easy to handle, and is mixed in the cream before churning. 3, produces a color resembling golden June grass butter. 4, it is the only article that will color the butter and not the buttermilk. 5, it gathers all the butter materials, and increases the weight more than enough to pay for the color used. 6, the color of the butter *never* changes. In short, it is decidedly the best article for the purpose ever offered for sale. For sale by your druggist or country store. Manufactured and for sale by

USE ONLY THIS THE FIRST AND THE BEST

COOLEY CREAMER, DAVIS SWING CHURN, EUREKA BUTTER WORKER, ETC.

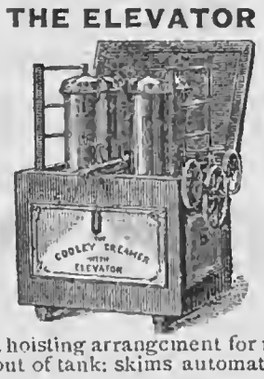
THE REGULAR.

Cans in this, removed to bench for skimming automatically.

THE JUNIOR.

Skims automatically without removing cans

THE ELEVATOR



Has a hoisting arrangement for raising cans out of tank: skims automatically.

THE CABINET.

Has a compartment under water tank, skims without removing cans.

THE COOLEY CREAMER.

Raises all the Cream between the milkings. Saves two-thirds of the labor. Increases the yield of butter. Improves the quality. Quadruples the value of the skim milk. Will pay for itself twice or more every season. The Cooley system is the only uniform Dairy method in existence.

MADE IN FOUR STYLES AND TEN SIZES.

CAUTION.

One of the strongest proofs of the great popularity of the COOLEY CREAMERS, and an undeniable confession of their superiority, is the large number of imitations on the market which claim the same unrivaled perfection of action possessed by these justly celebrated creamers. We therefore caution all persons not to buy or use any of said imitations and infringements, as we shall protect our rights to the full extent of the law.

Highest award at the International Dairy fair at New York, December, 1878.
Gold Medal, Paris, 1879. Gold Medal, London, 1879.
Gold Medal and Sweepstakes, International Dairy Fair, New York, 1878 and 1879.
Silver medals, New England Fair and Vermont State Fair.
Medal and First Premium at Cincinnati Exposition, 1879 and 1880.
Medal and First Premium at National Fair, Washington, 1880.
And First Premium at nearly every State Fair where exhibited, and the largest yield of any factory or dairy in the great Dairy State of Iowa, 1880.

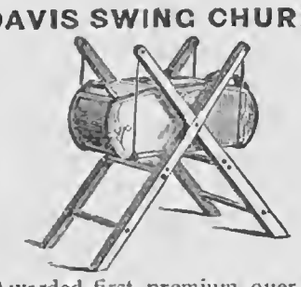
THE Improved Evaporators

MAKE BETTER SYRUP, SUGAR, and JELLY, with less fuel and labor than any other apparatus. Will condense Sorghum Juice faster than any evaporator in use, and consequently make lighter syrup and white sugar. The best apparatus known for making jelly from sweet cider. Send for descriptive circular of Evaporators, Cane Mills, etc.

EUREKA BUTTER WORKER.

Works all portions of the butter equally. Leaves grain of butter in much better condition than workers with corrugated rolls. Is very popular with "gilt edge" butter makers.

DAVIS SWING CHURN.



Awarded first premium over all competitors at only practical test ever held at International Dairy Fair. The box contains no floats or inside gear. This churn needs only to be seen to be appreciated.

Address, **VERMONT FARM MACHINE COMPANY, Bellows Falls, Vt.**

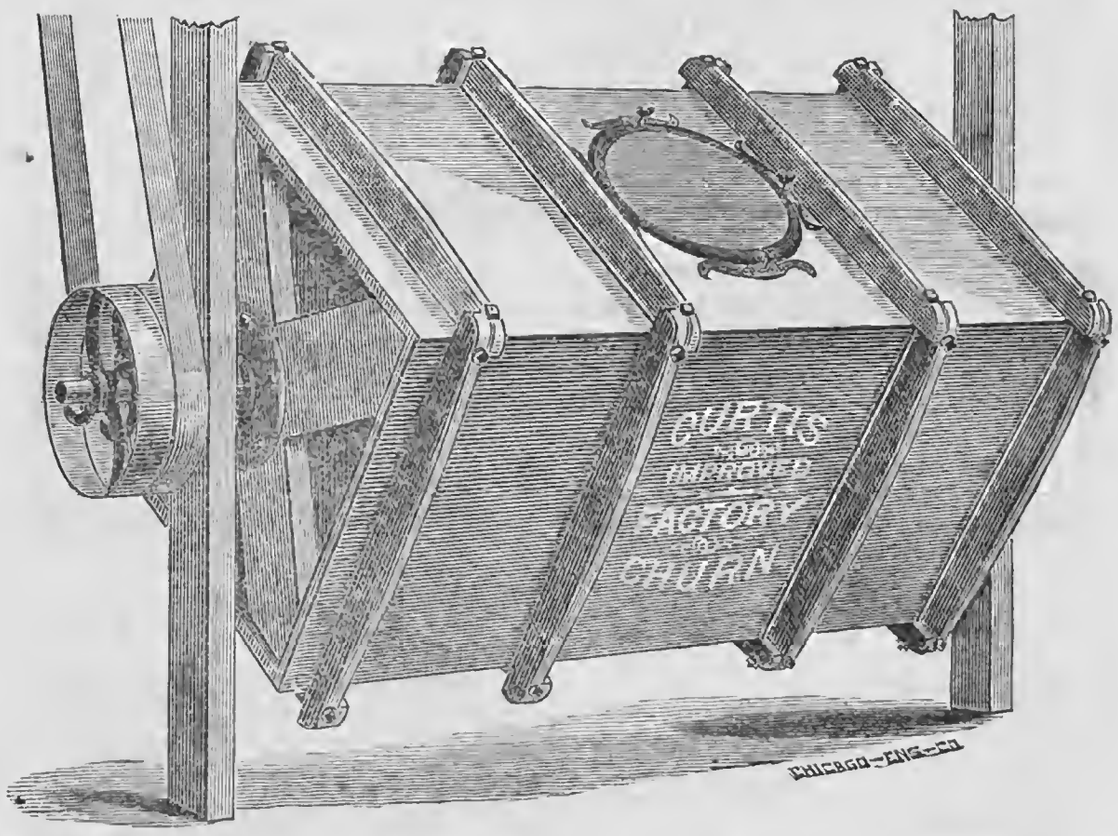
Factory Churns and Power Butter Workers.

USED IN THE BEST CREAMERIES OF WISCONSIN, IOWA AND ILLINOIS.

Unquestioned proof given of their Superiority as to WORKMANSHIP, DURABILITY, EFFICIENCY and ECONOMY, and, what is more to the purpose,

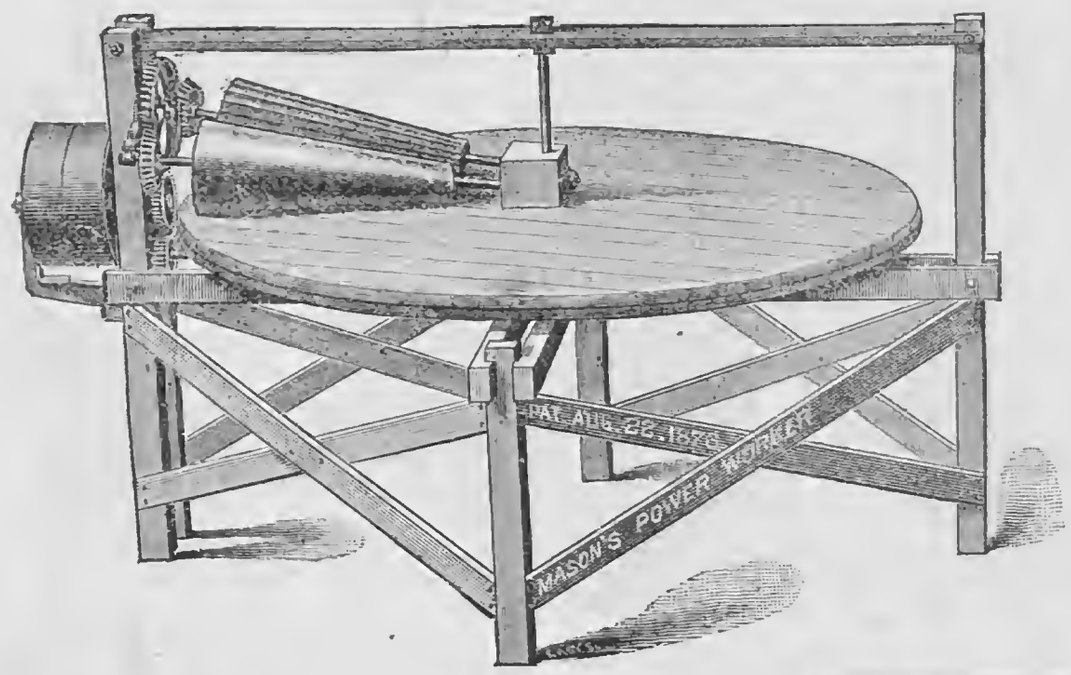
ONE HUNDRED CREAMERIES,

the most prominent in the Northwest, can be referred to, if further proof is necessary. Correspondence solicited.



MASON'S POWER BUTTER WORKER.

The *ne plus ultra* of ALL the Butter Workers, where over 200 pounds of Butter are churned in a day. Capacity of Worker 6,000 pounds per day. Endorsed and used by the best Creameries in the Northwest.



Rectangular and Square Box Churns.

Cheapest and Best. No Inside Fixtures, and ALWAYS RELIABLE.

Seven sizes of each kind made, churning for one cow to fifty. Three sizes *each* of the EUREKA and LEVER BUTTER WORKERS made. Best material used, and every Churn and Butter Worker *warranted exactly as represented.*

No Churn has received so many unqualified endorsements from prominent dairymen, in all parts of the country, since its first appearance seven years ago, as the RECTANGULAR. It is strongly endorsed by the *Rural New-Yorker*, in papers on the "Dairy Cow," by Henry Stewart. The great popularity of the RECTANGULAR is well attested by the fact that, with increased facilities for manufacturing, the demand this season was largely in excess of the supply, one dealer alone selling 500. Orders for next season should be sent early. One Churn at wholesale where we have no agent. Send *postal* for *Dairyman*, giving full particulars free.

Domestic.

PITHS.

GOOD breeding is good sense.

A vacant mind takes all the meaning out of the fairest face.

Wildness is a thing which girls cannot afford—delicacy a thing which they cannot lose or find.

A teaspoonful of powdered charcoal in a glass of water often relieves headache.

Lemon juice is recommended in cases of diphtheria. The juice is applied to the affected parts by means of a camel's-hair brush.

We believe the majority of persons having charge of milk allow the cream to become too sour before churning. In fact, we have made better butter and butter that would keep longer, from perfectly sweet cream.

Persons gathering materials for Winter bouquets will appreciate the note by a correspondent in last week's RURAL. The dried tassels of corn are, indeed, an addition to dried grasses, leaves, etc., and are every bit as worthy to be gathered as the plumes of erianthus, eulalia, and the like. But to be pretty they must be cut before they are out of the sheath and while of a greenish hue.

Early last Winter "little year-old" caught a severe cold by kicking the blankets off from him at night. We pinned the blankets to the mattress and tried to sleep with one eye open that we might keep him covered. But to no purpose; he still caught cold. The case was becoming desperate when we hit upon the plan of putting him in a bag. A flannel skirt, a yard long and a yard and a half wide, was sewed up at the bottom and the band made just large enough to draw up over his feet and pin around the waist. The length and width of the bag gave ample room for kicking, and as the flannel was old and soft it did not fret him, but proved an effectual safeguard against colds at night, and we only questioned why we had not thought of it before.

A Fair Lunch.

"WHAT do you want for lunch?" I asked of the household as I stood, basket in hand, one September morning. "Apples," shouted one boy; "Grapes," said another; "Ginger-bread," suggested little four-year-old. And when papa asked for sandwiches and the girls for crullers I thought we had come to the end of our list. But at the last moment Aunt Maria came over with a plate of caraway cookies that were so good I asked the recipe. It was:—

Half a pound of butter and half a pound of sugar rubbed to a cream, three eggs well beaten, one ounce of caraway seed sifted through the flour, with enough flour to roll out pretty stiff. Make into a thin sheet; cut out with a cake-cutter; prick with a sharp fork, and bake in a moderate oven.

Mary made some toast and buttered it lightly, put on a thin layer of cheese and placed it in the oven a few moments to melt; then another slice of toast was placed on the top. It is quite a relish at a pic-nic, and added variety to the very *fair* lunch. A. L. J.

A HYGIENIC PIE, Etc.

E. K. B.

AUNT SARAH, who is our model housekeeper, dislikes so great a use of lard as most people consider necessary, and with the aid of Miss Colman and other hygienic cooks, she is always "conjuring up" something that will take the place of the omnipresent "American pie." On our late visit there she treated us to so delicious a dish that (while our husbands, who have sympathies in common, as enthusiastic fruit-growers, were discussing the comparative merits of some beautiful early Beatrice and Louise peaches), I begged of Aunt Sarah the recipe for the nice pudding we had for dinner. "Not a pudding," she said, "that is hygienic pie, and you make it this way:

"Rub with sweet butter the inside of a pie-tin or dish that is at least two inches in depth; sift into it some Graham flour; then turn the pie-dish bottom up, when most of the flour will drop out, leaving just enough flour adhering to the butter to form the pie-crust, which is now ready for the filling. Beat the yelks of four eggs (seven eggs will make two pies) and add to them two large spoonfuls of sugar, a pint of milk, and any flavoring you choose; turn into the pie-dish and bake in a rather slow oven. Then cover with the whites of the eggs well beaten, with three spoonfuls of sugar. Replace it in the oven and leave until very slightly browned. Set it upon ice until wanted for use.

AN OLD-FASHIONED CEMENT.

Many years ago I saw an old lady tie a broken glass dish together and boil it in milk until it was cemented firmly, but I had forgotten the incident until it was recalled by an experience of my own. I have a favorite granite-ware dish which is constantly in use in a variety of ways—sometimes for stewing fruit, or baking a pudding, or cooking succotash or tomatoes; in fact, it would be hard to tell what it was *not* used for.

One day, last Fall, it was on the stove partly full of milk, of which I intended to make a cornstarch pudding. A friend calling was invited to stay to dinner, and I bethought me to enlarge my pudding by another cup of milk before adding the eggs, etc. The instant I poured the cold into the boiling milk I was startled by a loud snap, and the next moment I saw the milk oozing through a crack that entirely encircled the bottom of the dish. Reproaching myself with carelessness, I hastened to remove it from the stove, fearing that it might come apart and deluge the hot stove with milk, which, you know, would be a catastrophe indeed. The milk dripped almost in a stream as I moved it, but soon after I noticed that the dish had ceased leaking, and upon turning out the milk I found that it was perfectly cemented. Ever since that time, months ago, it has been in constant use as before, until a few days since I found it again leaking. I filled it with milk, set it on the back of the stove, and, to my satisfaction, soon found that it had taken out a new lease for a useful life. There is so much worthless granite-ware of that sort that when a *good piece* is found, that never absorbs fat or odors of any sort, it is really valuable and worth preserving.

Securing the Corks of Bottles for Tomato Catsup.

EVERY year we make from 40 to 50 pints of tomato catsup, putting it into pint champagne bottles. Until last year we simply cemented the corks—once or twice tying them down—inverted the bottles and kept in a cool and dry place. But many disastrous bursts made us feel that unless we could secure the corks in a firmer manner we should give up catsup mak-

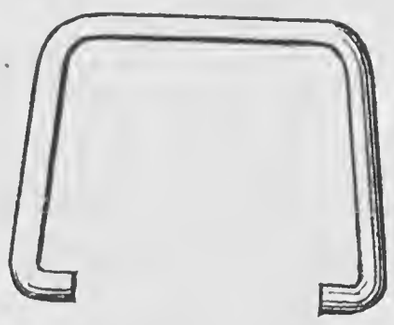

FIG. 432.

ing. Seeing a bottle of California wine charged with carbonic acid, the cork of which was kept in by means of a clamp, as shown in Fig. 432, we wondered why that would not solve the catsup question. Last Fall, after bottling our catsup and driving in the cork, these clamps were put on and the tops dipped into a hot cement of beeswax and resin. The bottles were then put into the cellar and we awaited action. But not one cork flew out and not a bottle burst. The clamps can be bought at hardware stores, and cost about 25 cents per hundred.

FAIR THOUGHTS.

ADELINE E. STORY.

I KNOW there are people who never go to the fair. What a pity. What a good dinner is to the man who is never good-natured till his stomach is well filled, the fair is to the multitude. It is enough to take the care wrinkles out of one's face just to see how everybody unbends, and for one day in the year forgets work and overwork, anxiety and failure, losses and crosses. I do not need to look at the exhibits to know whether the fair is a success, the peoples faces tell me that, and there is always a little more of reliance in the countenances of those men and women who have helped to make it.

Whatever we may think of candy for children as a general thing, do let's give them some of the made-on-the-spot cream and molasses candies at the fair. The day is never quite complete to them without that.

We like to carry our fair dinner with us and picnic with one or two neighbors' families asking those to join us who have children that our little folks may have a good time. To give the dinner a fair-day relish we add fruit bought on the grounds of a kind not to be had at home if possible.

What it Does.

Kidney-Wort moves the bowels regularly, cleanses the blood, and radically cures kidney disease, gravel, piles, bilious headache, and pains which are caused by disordered liver and kidneys. Thousands have been cured—why should you not try it.—Contributor.—*Adv.*

A Pure and Effective Hair Dressing.

COCOAINE, a compound of Cocoanut Oil, beautifies the hair and is sure to allay all itching and irritation of the scalp.

The superiority of BURNETT'S FLAVORING EXTRACTS consists in their perfect purity and strength.—*Adv.*

AN OFFER
—TO—
CONSUMERS
—OF—
TEA & COFFEE.

We have made a specialty during the past five years of GIVING AWAY as PREMIUMS, to those who get up CLUBS for our Teas, DINNER SETS, GOLD BAND TEA SETS, SILVER-PLATED WARE, and other articles both useful and ornamental.

We import and buy direct from manufacturers all the goods we handle, and own them at the *lowest possible price* cash will purchase. During the past five years we have sent from our store over 15,000 of these orders, and they have gone into almost every State in the Union.

We keep in stock *every variety* of Tea known, and at all prices.

Oolong, Japan, Mixed, English Breakfast, Old and Young Hyson, Imperial, 50c., 75c., very finest $1. Gunpowder, Black Japan, Foochow 75c., $1. Orange Pekoe and Assam, 85c and $1.

Below are a *few* of the many Premiums offered:

With a $5 order we send a *Silver-Plated Caster.*

With a $10 order we send an *English China Tea Set of 45 pieces.*

With a $15 order we send a *Silver-Plated Caster, Pickle Dish and Butter Dish* or an *English China Decorated Tea Set of 44 pieces.*

With a $20 order we send a *French China Gold Band Tea Set of 44 pieces,* or an *English China Dinner Set of 106 pieces.*

We have *hundreds* of letters like the following:

WAUKON Iowa, July 7th, 1881.

Gents—Tea and Tea-Set arrived in good order. I am very much pleased with premiums, for which accept thanks. The tea has proved good so far as I have heard. Respectfully, MRS. J. M. DEAN.

TAUNTON, Mass., March 8, 1881.

Gentlemen—I have forwarded eight different orders for Tea, and have received as premiums a tea set, a silver-plated caster, a dinner set, a glass set, a case of silver-plated knives and forks, a pair of French china fruit dishes, and *two ladies' gold watches*, and am now on my ninth order. Both Tea and premiums I am well pleased with, and have found perfect satisfaction with both. Yours truly,

MRS. MARIA C. LYNCH.

NASHUA, N. H., June 10, 1881.

Gentlemen—I am much pleased with my Premium Tea-Set. Accept thanks. The Teas are giving good satisfaction. Hope to send another order soon.

Yours, &c., MISS M. A. BALL.

Orders, with P. O. Order, or money enclosed in registered letter can be sent at our risk. All checks or Post-Office orders should be made payable to F. M. LINNELL.

We also send Teas by mail, without premium, postage paid at list prices, to those who wish for choice goods and are so situated they cannot obtain them at home. For full price and premium list, send us postal, with address PLAINLY WRITTEN. Please mention this Publication.

It will bake, broil, roast, and heat irons in less time and with less fuel than any other stove in the market. For elegance of design and heating power it has no equal. Send for illustrated catalogue.

Dangler Vapor Stove and Refining Co.,
CLEVELAND, OHIO.

HARP-ETTE
The Great Musical Invention of the Age.

A new instrument which meets a want long felt by the public. The delicious music of the HARP is here produced by any one, even though entirely ignorant of music. The strings are numbered from one to ten, and the music which accompanies the instrument is numbered in like manner, instead of being printed in notes. Thus, if you wish to play "HOME, SWEET HOME," or any other tune, you have only to glance at the music to ascertain the number of the note and pick the string which is correspondingly numbered. With this instrument any one can play all the popular airs of the day, or in fact any music that has ever been published. No training is required. It can be played upon at once. Everybody appreciates the music of the harp. It is the KING of musical instruments, and this is a perfect harp in miniature—the same delicious tones—and should be in every family in the land. Elegantly finished and an ornament to any room. A strong, durable instrument, which will last a lifetime. Cannot get out of order. We also send with it a large lot of music numbered as explained above. Perfect satisfaction guaranteed. Every one who purchases endorses them and recommends them to their neighbors. Think of it—no more tedious months of study to master music. Here is a superb musical instrument all ready for use and requiring no practice to play perfectly. Send at once and in the HARP-ETTE you will have "a thing of beauty and a joy forever." Price, No. 1, 10 strings, $1.25. No. 2, 15 strings, $1.75. Sent PREPAID to any address. Belcher James & Co. 106 Sudbury St. Boston, Mass.

BRIEFLETS.

CANNED PEACHES will be dear next year....

MR. DECKER, of Kentucky, tells Mr. Geo. S. Wales that he is "still of the opinion that the Longfellow is the best large strawberry in the world." He had them four by six inches in circumference. At the Rural Grounds Sharpless is larger and more productive but less regular in shape.....

MAJOR FREAS (Penn.) regards the Gifford Pear as the most desirable variety among early pears, and he thinks it ought to be found upon every farm and in every garden. It is a rampant grower, an early and constant bearer and of excellent quality.....

THERE are men who have so little of earnest ambition in their lives that you are forced to the conclusion that they were born merely for the purpose of digestion.....

NO MAN can go into bad company without suffering for it. The homely old proverb has it very tersely, "A man can't bite the bottom out of a frying-pan without smutting his nose."....

THE Farming World very justly holds that a newspaper publisher has no more right to exact money for *imagining* hundreds or thousands of circulation than a merchant has to sell twelve yards of calico and measure but ten yards.....

MR. CULBERT MURRAY (England) says that an ordinary-sized dairy cow in full profit will consume from 65 to 70 pounds of food per day—say 20 pounds of hay, 40 pounds of roots or other green food, 3 pounds of decorticated cotton cake, 3 pounds of Indian meal, 2 pounds of bran, and 2 pounds of bean meal, at a cost of 84c. per week. In addition, the cow will require from three to four gallons of clean water daily. Prudent managers feed liberally and water sparingly during the early part of the day, increasing the water supply as the day wears on. The solid and liquid excrements will average about 90 pounds per diem, and, if carefully preserved, contain fertilizing elements worth 60 cents per week.....

MR. CRESWEN estimates that out of 60,000 or 70,000 houses built in London 50,000 are not really fit for human habitation.....

THE Gardeners' Chronicle says that if there is nothing in a name then it matters not that the good old English word "Nosegay" has given place to the French word "Bouquet," yet many there are who still cherish the former for the sake of its home associations.....

THE Iowa Chronicle is not in favor of farmers selling corn at 20 cents a bushel and then buying sweet corn at 20 cents per can; or of sending pork and beans to Boston to be cooked and put up in cans and sent back to them labeled "Boston Baked Beans." But we suspect that such complaints are numbered—the West is doing as well as could be expected. The World wasn't made in a day.....

AMONG THE MANUFACTURERS in the West this season none have been more busy than J. E. Porter, of Ottawa, Ill. He has enjoyed a very prosperous year's trade in his Farmers' Hay Carriers, Patent Hay Derricks, Horse Hay Forks, and his New Hay Sweep. Look out for him at the fairs, as he will make exhibits of his machinery in operation, and farmers can learn the new and effective mode of handling hay, and also the saving they can make by having his improved hay tools.—*Adv.*

The Rural New-Yorker has growing at the present time in its Experiment Grounds, 60 different kinds of grapes, 100 of strawberries, 30 of raspberries, all of the different kinds of currants, gooseberries, &c., as well as specimens of all the best kinds of ornamental trees and shrubs which are hardy enough to endure the climate.

FOUTZ'S

MANCHESTER,
THE
Great Strawberry of the Future.
The most productive, the firmest, large, handsome and of the best quality of any productive strawberry yet produced: in fact it is believed to be the
"Greatest Strawberry on Earth."
Hear what the best authorities say of it:
"The Manchester has more good qualities than any other strawberry in cultivation. For shape, color, flavor, beauty, firmness and uniform large berries as well as for productiveness and hardiness of plants combined, it has no equal."—F. M. HEXAMER.
"I have never seen a strawberry that in all respects impressed me so favorably. In this I think the strawberry has been discovered that has long been sought for."—PETER B. MEAD.
"I regard the Manchester as a very promising variety indeed."—E. WILLIAMS.
"I truly believe it is destined to become one of the most popular varieties."—E. P. ROWE.
"I deem it worthy of extensive cultivation—combining all the requisites for market or family use."—WM. PARRY.
"It invariably commands high prices. It keeps its color the best of any strawberry I ever handled, and 'stands up' well"—C. W. IDELL, Wholesale Commission Merchant.
SPECIAL CATALOGUE of this remarkable strawberry, giving opinions of experts more fully, notices of the press, history, etc.; *with a Colored Plate* of a plate in fruit, will be mailed free to all who apply.
MY GENERAL ILLUSTRATED CATALOGUE, for Fall of 1881, will be ready for mailing about Oct. 1st. It costs nothing, and may save you a great deal. Send for it.

TWENTY YEARS AGO a man bought a Fairbanks Hay Scale, for which he paid two hundred dollars. Having some knowledge of the cost of things, he was surprised at the difference between cost of manufacture and selling price, and came to the conclusion that scales could be sold at a fair profit and the price so reduced that every farmer in the country not only could afford to buy a scale, but could not afford to be without one. He went into the manufacture, and offered scales at such low prices that people were afraid they were not good; but time proved their value, and, notwithstanding the monopolists have a liar at every corner to cry "the Jones Scale ain't good for nothin'," there are many people who have had them in use nearly twenty years and have not found it out yet. Jones of Binghamton has succeeded, and the secret of his success is, satisfaction or no sale; and he has stood square up to it every time without flinching, and the result is that the most popular scale in the world is the JONES Five-Ton Wagon Scale, which is *full, regular*, "genuine" scale, made of Iron, Steel and Brass, equal in quantity and quality of material and skill in workmanship to *any scale ever made by anybody.* This Scale is sold at $60, freight paid by Jones. Any desiring information regarding the price of any size scale should address Jones of Binghamton, Binghamton, N. Y.—*Adv.*

Prof. E. M. Shelton, of the Kansas Agricultural College, says "The Rural New-Yorker has more influence and is more quoted than all the rest put together."

Champion of the World.

THE

CHAMPION GRAIN DRILL.

Positive *force feed* Grain Distributor. Positive *force feed* Grass Seeder, which can be used either in front or rear of the hoes.

The fertilizer Attachment, is unequaled, and is *warranted* to sow easily and evenly any of the various kinds of guanos and phosphates in the market.

The Champion is the only Grain Drill in the market that has a special attachment for planting corn for the crop.

The Champion is simple in construction, easily operated both for team and driver. The materials used and quality of workmanship are the very best.

Do not fail to examine the Champion before purchasing a Grain Drill.

All questions concerning the Champion answered promptly by mail. ☞ Every Drill warranted.

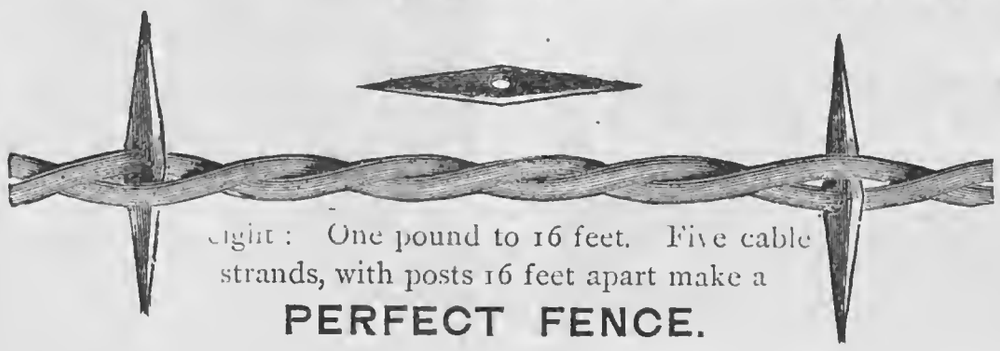
KELLY STEEL BARB WIRE!

An Indestructible Diamond Steel Barb.



Light: One pound to 16 feet. Five cable strands, with posts 16 feet apart make a

PERFECT FENCE.

A Fence for a Lifetime!

THE KELLY STEEL WIRE,
When properly put up, is the
BEST PROTECTION
to growing crops of any material
IN EXISTENCE.

Cattle of the wildest nature will respect it and forever leave it alone. The ***sharp barbs*** serve as an educator to the animal, and give warning to the aggressor upon the first contact.

The Kelly Barb,

Unlike any other make, has a yielding action on the main wire, which, with its bevel shape, can never ***seriously lacerate stock.*** It is therefore preferred and adopted by the leading ***Railroads, Planters, Stock-Raisers and Farmers.***

It is proof against WIND, STORM, FLOOD or FIRE, and costs but little more than half as much as lumber.

DON'T FORGET IT!!

The Kelly Wire is the only one made using an absolutely ***RUST PROOF and FIRE PROOF COVERING, which will not SCALE OFF. Does not need repainting. BUY NO OTHER.*** If your merchant does not keep it, send direct to the manufacturers, for sample, estimate, circulars, etc.

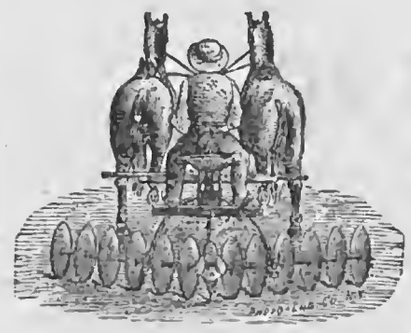
Straw-Preserving Rye Threshers.

We wish to call special attention to our "Straw-Preserving Thresher," the only machine that will thresh and save the straw from being broken. The machine is indispensable, especially in places where the straw is used for making paper, as it brings a higher price, being perfectly straight and unbroken.

SHINGLE MACHINES,
WOOD-SAWING MACHINES,
Tolley's Champion 1 & 2 Horse Cultivators.

EAGLE HORSE OR HAND DUMP RAKE,

Can be operated by a boy or girl 10 years old.

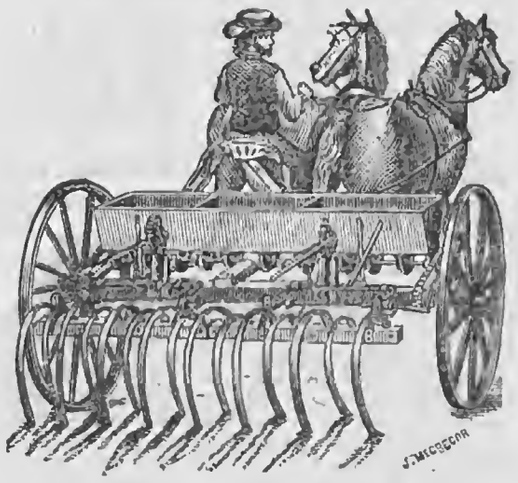


LA DOW'S
Jointed Pulverizing Disc Harrow,

WITH SEEDER ATTACHMENT.

We have added a "Seeder Attachment" to our Disc Harrow, which allows the Seed to be put in the same as with a drill, thus combining a thorough Pulverizer and Seed-Sower, making a perfect working machine, which with one operation pulverizes the ground, sows the seed, and covers the same perfectly.

La Dow's Sulky Spring Tooth Harrow and Broadcast Seeder with Phosphate Attachment.



Sows any desired amount of Grain or Grass Seed per Acre.

SOWS PHOSPHATE
WITHOUT
PASTING OR CLOGGING.

The Spring Teeth cover the grain as deep as desired, much cheaper than a drill,

COMBINING
TWO MACHINES
IN ONE.

NEW SAFETY AGRICULTURAL ENGINE AND STEAM GENERATOR.

Economical, Durable, Light and Efficient.

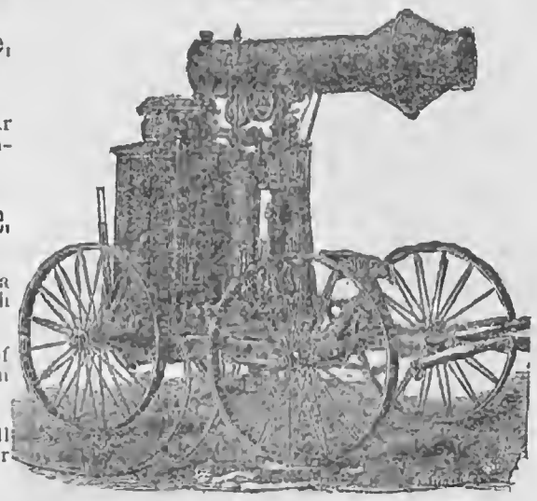
Owing to the peculiar construction of this Generator, it is

Impossible to Explode.

Steam can be raised to a pressure of 100 lbs. with cold water in ten minutes.

A saving of 50 per cent. of fuel over any Boiler now in use.

For full particulars of all our machinery, send for Circulars and Price List.



WHEELER & MELICK CO., Albany, N. Y., U. S. A.

THE RURAL NEW-YORKER'S GREAT CORN YIELD.

Interesting facts for new Readers.

LAST season the farming community were somewhat startled by a statement printed in these columns, from the Rural Experiment Farm, that the yield of corn would reach upwards of 150 bushels of shelled grain per acre. Naturally the statement was discredited, even by the Rural's friends. Some mistake, it was thought, must have been made, especially as this immense yield had been produced on fields that had for six or more previous years received no manure of any kind, and for the corn had received an average of but 400 pounds of concentrated fertilizer.

A number of well-known men were invited to the Rural Farm to examine into, and to confirm or disprove our statement. The following report was signed by Robert J. Dodge, C. E., President Farmers' Club, American Institute; W. N. Habershaw, F. C. S., Chemist, N. Y. State Ag'l. Society, and L. C. Benedict, Ag. Editor of the New York World:

"Report on a field of corn at Hewlett's, Long Island, belonging to the RURAL NEW-YORKER, made Oct. 12th, 1880. Size of plot, 310 ft. by 122.4, or .87 of an acre of corn—"Blount's Dent"—sown by machine in rows four feet three inches apart, and each single kernel intended to be 15 inches from its neighbors. Flat culture, with, as we understand, 300 pounds of special corn fertilizer harrowed in broadcast before planting, 100 pounds of the same when the corn was six inches high, and 100 pounds of potato special when about 18 inches high. From a judicious selection of stooks and careful measurement and weighing, we find the total yield was 227 bushel baskets of corn on the cob, or 261 bushels upon an acre.

We also shelled and weighed a quantity and ascertained the gross weight of three and seven-eighths baskets to be 136 pounds, or 35.1 to one bushel, and further that 35 pounds of corn in the ear gave 28.95 pounds of grain and 6.05 of cob, and measured 17.1 quarts.

This calculation showed that the equivalent of 261 bushels of corn on the cob was 139.4 bushels of grains, and about three bushels or a little more which Mr. Carman had selected from the most prolific stalks, and had already placed in the barn, or a grand total of about 142 bushels of shelled corn per acre.

ROBERT J. DODGE, C. E. Pres't Farmers' Club, American Institute.
W. N. HABERSHAW, F. C. S., Chemist, N. Y. State, Ag'l Society.
L. C. BENEDICT, Ag'l. Ed. N. Y. World.

Other certificates from gentlemen well-known to the country were published afterwards, so that our statements as to the yield were substantially corroborated, and, as the actual measurements afterwards attested, this must stand as the greatest yield of Indian corn ever produced, the cost of production considered.

The Fair Number of the Rural New-Yorker is issued annually. We shall be pleased to send specimen numbers of our regular editions to all who apply, free and post-paid. Thus all may have the opportunity of judging for themselves.

CHAMPION SULKY PLOW

A PLOW OF GREAT STRENGTH.

Simplicity, Durability and Ease of Operation. Adapted for use everywhere. Circulars giving full information free. Address J. LANE REED & CO., (Sole Manufacturers,) DAYTON, OHIO.

NOYES HAYING TOOLS,

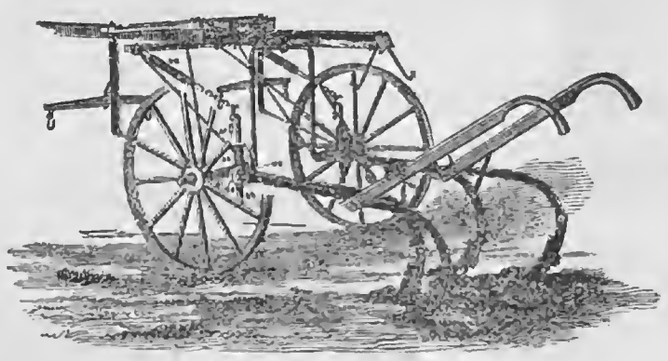
Send for circular B and designs for tracking barns to

U. S. WIND ENGINE & PUMP CO, Batavia, Kane Co,, Ill.

DEERE & COMPANY, MOLINE, ILLINOIS.

ESTABLISH ED 1847.



The Deere Spring Cultivator.

The Deere Spring Cultivator

Has had the largest sale of any cultivator ever put upon the market, and in sections where it has been introduced the farmers will use no other make. The weight of shovel-rigs is sustained while at work, so that the operator can move them sideways with the greatest ease, and can cultivate between the hills as well as between the rows of corn. The Springs can be regulated according to the condition of the ground, so as to sustain much or little weight, at the will of the operator by shortening or lengthening the chains.

Farmers must not be deceived

into the belief that every kind of a spring improves a cultivator. Our springs are used to arrest the tendency of the shovels to run too deep, and this is what lightens the draft on the team, and labor to the plowman, transferring, as it does, the weight of shovel-rigs to the wheels. Remember the Deere Spring, and learn its merits before buying and you will buy no other.

The Gilpin Sulky Plow.
40,000 sold in six years.

The Gilpin Sulky Plow

Has been successful in every contest at home and abroad, the first prize having been awarded this plow at the Centennial Exposition in Philadelphia, and also at Paris, France, in 1878, where its great merits secured it the highest premium over fifty competitors from all parts of the world. This plow is made

With only One Lever,

with which all the changes can be made to enable it to do any work that can be done with a hand plow. This is

PECULIAR TO THE GILPIN ALONE,

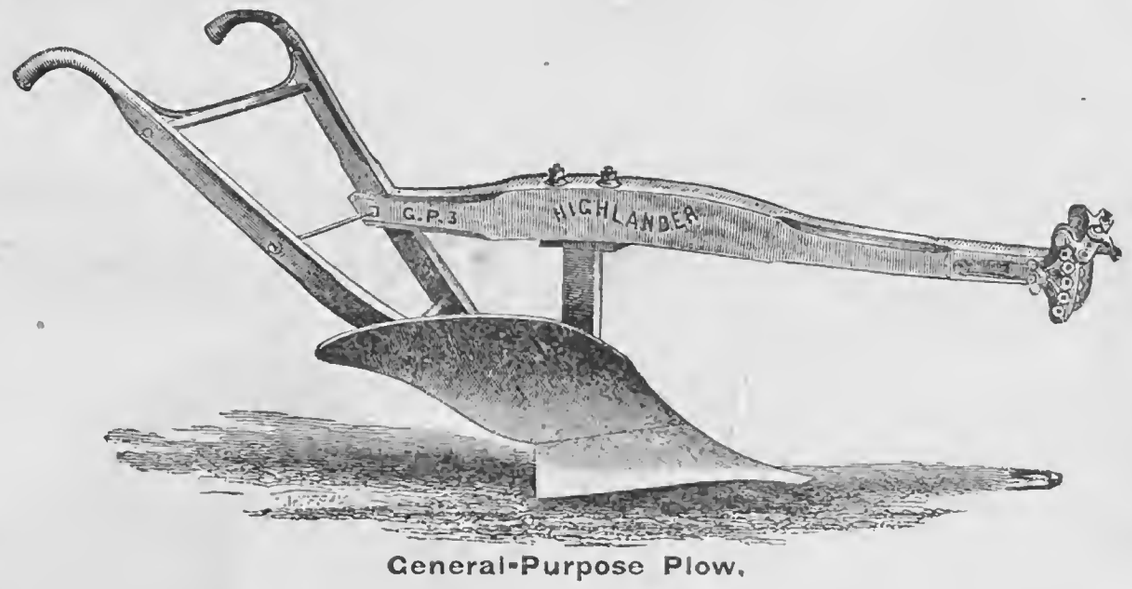
and it will do better work and plow satisfactorily where other makes having two or more levers—thus complicating the machinery and work for the plowman—cannot be made to operate.

The Power Lift

has also been added to this plow for 1881, and its construction is the finest of any in use.

REMEMBER THAT THE COMPLETE SUCCESS OF THE GILPIN SULKY PLOW HAS REVOLUTIONIZED PLOWING, AND NO FARMER WHO HAS USED THE GILPIN CAN BE INDUCED TO USE ANY OTHER KIND.

GENERAL-PURPOSE PLOW.



General-Purpose Plow.

For heavy land, timothy sod and deep tilling, this plow has no equal in the market. It is of long, easy turn of mold, light draft, and inverts stubble completely without "flirting," leaving "readable" furrows to be pulverized by the harrow, and is therefore an especial favorite with old country farmers. It fills a want long felt by farmers who "rotate" their crops and require the same plow for use in both sod and stubble. Capped standard, hardened iron centre steel molds, patent wrought frog, hardened steel shares, double shin, medium steel landside, adjustable for either two or three horses, both right and left hand, patent handle brace.

Circulars regarding prices or any information concerning the above Plows, and anything in the line of Plows, Harrows or Cultivators, can be had by addressing the manufacturers,

Deere & Company Moline Plow Works, Moline, Ills.

PROF. BREWER says that there are probably 800 or 1,000 exhibitions devoted entirely or in part to the interests of agriculture, held in the United States every year, and probably five or more millions of people see something of them. It would be passing strange if in all these, voluntary gatherings, as they are, and pertaining to such a variety of interests and multitude of details, something did not sometimes creep in that had better be left out; but how very little there is of this compared with all that is meritorious! Taken all in all, their work and their record have been glorious, and they will continue to be a prominent feature in our progressing civilization.

Peter B. Mead, the veteran horticultural editor and writer, says "The Rural New-Yorker is not afraid to tell the truth in the true interests of Agriculture and Horticulture.

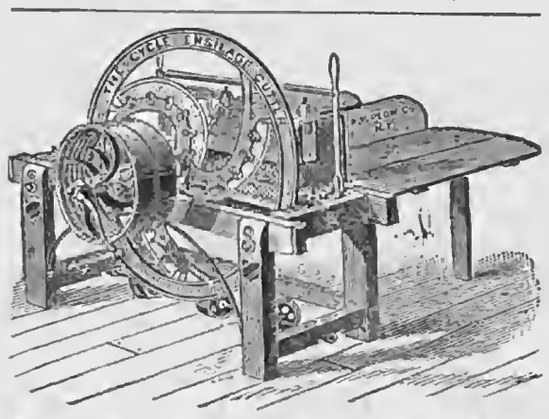
E. W. ROSS & CO., Fulton, N.Y.



The Cycle Ensilage Cutter,

After much experience in manufacturing large cutters, we have found that this principle is the best for cutting large quantities of green crops, especially for Ensilage, for which business ordinary feed cutters are too weak, too slow, dangerous to use, clog and unreliable. This machine puts the crop in the very best shape for this purpose, cuts at any speed without clogging, and without winding on the rollers, Green Maize, Clover even when wet, Cow Pea, Millet, etc., without mashing the green stalks. This cutter is also excellent for cutting Hay, Straw, or Dried Corn-Stalks.

The system of ensilage which we have had the honor of introducing to the farmers of the United States, and which must prevail in all sections of the country, requires such a machine as this to make it profitable and safe, in order that the silo may be filled as fast as two feet per day at least, to prevent heating.

THE CYCLE CUTTERS cut with less power for the result than any other form of machine. They have three knives, with long drawing cut, so leading each other that the cut is continuous, smooth and without jar. The length of cut is easily changed to be either ⅜ or ¾ inch. With these machines a fine cut (¾ inch) can be had as cheaply as 1 inch with cutters made on any other principle. The knives are adjustable by the simplest set-screws and are covered (cover not shown in cut).

There is an aperture for dropping stones before reaching the rollers, so that there is very little danger of any reaching the knives. The cutting-plate is of hardened steel and is simple and easy to replace in case of accident. In this respect the Cutter is an improvement on all others before made in Europe or America. It can be kept in order and repaired at home in case of an accident, which would be impossible in more complicated machines. Stop-levers are on both sides of the cutter by which feed-rolls can be instantly stopped. The *Worm* driving gear is peculiarly simple and durable, and it is apparently impossible that any break down can occur while a silo is being filled, while the smooth *whiz* of the knife is a great contrast to the *chop, chop* of smaller cylinder cutters offered by other manufacturers for this purpose. We make sizes to suit all buyers, from hand power to steam engine, 2 to 10 tons per hour, and with Elevator.

We can refer to such purchasers as Francis Morris, O. B. Potter, C. W. Mills, Whitman & Burrell, R. M. Hoe, who have previously used other machines for the purpose. We also manufacture Horse Powers, Lever and Tread. Circulars of Cutters, and Treatise on Ensilage, free. Goffart's Treatise, translated by J. B. Brown, 30 cts.

BIG GIANT CORN AND COB MILL.

Improved with Sifter Attachment.

EVERY MAN HIS OWN MILLER.

A HOME GRIST MILL COMPLETE.

This Mill has an Automatic Sieve of any degree of fineness required, and will grind and bolt or sift the meal ready for use, making about seven-eighths of the product a beautiful, fine grade of family meal, equal to that made on a buhr stone; the other one-eighth is about what you would give for toll, and is ground into good feed; if desired it can be run through the mill again and so reduced to meal.

The sieve can be quickly removed, and the mill used for crushing corn and cob, or small grain.

We put this Sifting Attachment only on our Improved Mills.

No. 2 Mill, capacity 2 to 3 bushels per hour, $60

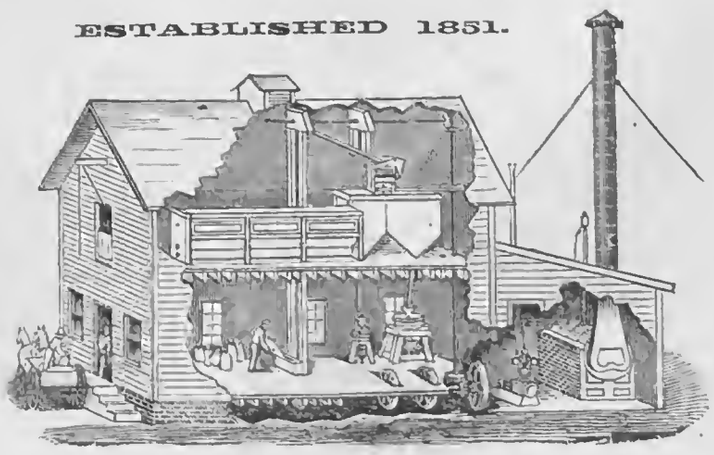
ESTABLISHED 1851.



BRIEFLETS.

PEOPLE cannot act well in public a part which they are not in the habit of acting at home.....

PROF. F. W. TUSTIN says, in the American Bee Journal, on the subject of bees puncturing grapes:—

"Our conclusions from observations and from the testimony of others are:—

1. That the bee cannot puncture the skin of the grape with either its tongue or its sting.

2. That it is possible that bees tear open grapes from the fact that they possess the necessary mandibular power.

3. That they rarely, if ever, do this, and that their depredations upon grapes are confined to those whose skin has been ruptured from some other cause.....

IN a recent lecture on the art of butter-making, the noted Dr. Voelcker remarked:—"It has been said, with a good deal of truth, that by over-manuring pasture land we reduce the fine quality of the butter made from the milk of cows fed upon such pasture. My belief is that the finest quality of butter is produced from pasture which contains a great variety of herbs, some of which might even be ranked as weeds.....

THE question is, Can ordinary pasture produce first-quality butter? and to that question I answer, 'Decidedly, if you take proper precautions to prevent the cream turning sour before it is churned.' This sourness, let me repeat, is the great hindrance in making high-class butter. Many persons deem this a small matter, and unconsciously allow the cream to get somewhat sour before making butter; but if you desire to produce good, sweet, keeping butter, you must churn cream as sweet as possible. This, you will be inclined to say, is an extremely simple matter; and I am almost ashamed to speak of such simple matters in the presence of so many experienced persons; but my experience is that simple things are the most difficult to make people learn. With most of us there is a peculiar tendency to aim after some big thing and to neglect the little thing, notwithstanding that it is on the latter that so much of our daily comfort depends....

IF you pour off the butter-milk as soon as the butter comes, you will have butter much more free from the cheesy or curdy envelope which originally encased it in the creamy globule. And you will never make first-rate butter unless you preserve a regular temperature in churning. The temperature should never rise above 60 degrees, it should be rather below than otherwise. I am no advocate of all these beautiful air churns and complicated contrivances. You do not want them. In a good churn you simply require an implement which enables you to churn sufficiently without overdoing it.....

B. C. TAYLOR,

New Horse Hay Rake.

Having again commenced the manufacture of Hay Rakes together with my son, we take pleasure in introducing my latest invention, a new Horse Hay Rake. It is simple and practical can be used either as a Hand or Horse Dump at the pleasure of the driver, without one interfering with the other; it thus becomes superior to anything in the market in points of simplicity, convenience, ease of handling, whether used as a hand or horse dump. The dumping device is the simplest one in use and cannot easily get out of order. It avoids the jar which soon wears out a rake no matter how well constructed. It is made of the best material and guaranteed, in point of workmanship and quality, to be fully up to the well sustained reputation of the 61,000 Taylor Rakes in five different styles, that have been sold and all of which gave the best satisfaction. AGENTS WANTED. Send for circulars to

B. C. TAYLOR & SON,
Dayton, Ohio.

PENNSYLVANIA
LAWN MOWER.
Surpassing all Others and Pronounced the Best

1881

It is the lightest, runs more easily, cuts longer grass, is more durable, requires less repairs, cuts grass more smoothly, is less liable to obstruction, and is of more handsome appearance than any other Mower on the market. The Pennsylvania State Agricultural Society says: "It will, we believe, wear longer, do the work better with less labor, than any other Mower. One of the peculiarities is that it cuts higher grass than any other Mower."

It is pronounced by competent judges the best Lawn Mower the world ever produced.

Every Mower warranted. Address

Published by G. & C. MERRIAM, Springfield, Mass.

The Herald of Praise.

Send on your Orders for this New Book for Choirs, Conventions and Singing Classes.

It is the work of L. O. EMERSON, of whose previous books of sacred music about half a million copies have been sold. So the issue of a new Church Music Book by him is a notable event. Judging by previous experience, as many as a hundred thousand persons are to use this, the last and best compilation, filled from cover to cover with new, fresh, interesting, practical music and words. Specimen copies mailed for $1.00. The usual reduction for quantities.

THE IDEAL is a companion book to the HERALD OF PRAISE, and is intended for Singing Classes only, with no reference to church singing. The contents are similar to those of the excellent HERALD, but matters are condensed, and whatever is not perfectly appropriate for Singing Classes is left out.

Specimen copies mailed for 75 cents.
The usual reduction for quantities.

With the IDEAL, which is a most real book, and the HERALD OF PRAISE, which is the best praise book, teachers and choir leaders will be fully equipped for a successful musical season.

THREE CAPITAL BOOKS!

Longfellow Birthday Book.

A beautiful little volume, an excellent combination of gift-book and album. On the left-hand pages are choice extracts from LONGFELLOW'S writings; on the right-hand pages, the names of famous persons born on the days given, and blank spaces for the autographs of one's relatives and friends. With a fine portrait of Longfellow and 12 beautiful illustrations. Price in cloth, $1; morocco, calf, or seal, $3.50.

Emerson Birthday Book.

A charming little book, similar to the Longfellow Birthday Book, containing choice selections from the writings of RALPH WALDO EMERSON, with a full portrait and 12 excellent illustrations. Price in cloth, $1; morocco, calf, or seal, $3.50.

On the Threshold.

By T. T. MUNGER. $1.00. A peculiarly readable and interesting book for boys just becoming young men. 'It is not a volume of sage dullness, but full of stirring life and vigor. IT IS A BOOK THAT SHOULD GO BY THOUSANDS INTO THE HANDS OF THE YOUNG."—*Lutheran Quarterly.*

THE LATEST. It has the most improved feed and all other advantages that farmers want.

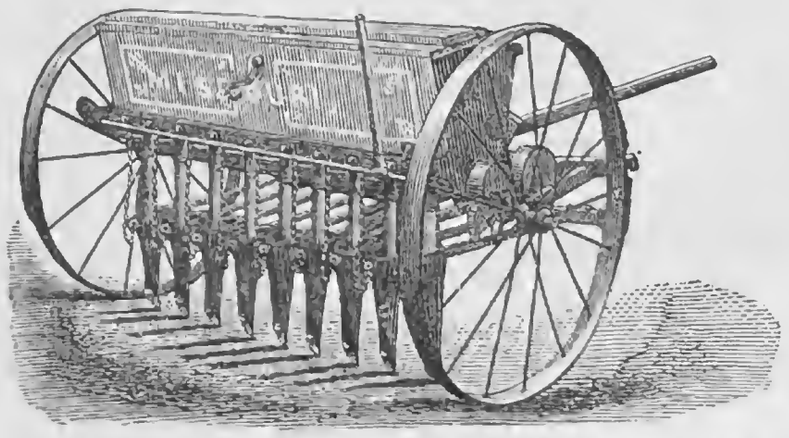
The Monarch Force-Feed Fertilizer.

Is warranted to sow a greater variety and worse condition of Fertilizers than any other Drill.

FOR LATEST CIRCULARS AND LOWEST PRICES MENTION THE RURAL NEW-YORKER AND ADDRESS.

Farmer's Friend Manufacturing Co., Dayton Ohio.

The Missouri Double-Rotary-Force-Feed Grain Drill



With Self-Shifting Rank Attachment. Lightest, Cheapest and Best in America.

Broad-faced, High, Wrought-Iron Wheels; No Wood Spokes or Felloes; No Tire Coming Loose.

The Missouri has been thoroughly tested in sowing all kinds of grain—including corn, beans, peas, etc. Grass Seed, Phosphates, Bone Dust, Guano, Salt, Ashes, Plaster, Ground Lime, Marl and such combinations as farmers make from barn and hen-house products.

Our new fertilizer attachment is a genuine force feed, and is so simple that it commends itself at sight. The quantity sown is regulated by cog wheels—same as the grain sower. No more power is required to propel the Fertilizer than the seeder, consequently the draft of the new combined drill is but a trifle more than a plain drill. We have also added a Force-Feed Grass Seeder, working on the same principle as the Fertilizer. Therefore our new combined drill is furnished with Three Positive Force-Feeds, none of which is used by any other Drill made. All of our Drills have SELF-SHIFTING RANK attachment, Land Surveyor, Neck Yoke, and Whiffletrees, without extra charge. Send for circular to

Farm Topics.

THE EXPERIMENT FARM OF THE RURAL NEW-YORKER.

HENRY STEWART, M. D.

JOURNALISM is advancing with rapid strides. A first-class newspaper no longer waits for news to come to it; it goes abroad everywhere, even into the highways and byways, as well as into the great haunts of men, and gathers news of all sorts wherewith to supply the public craving. Secular and technical journalism are alike in this positive need. But among the class of newspapers known as agricultural journals a new departure, which is creditable as a mark of enterprise and honest endeavor to secure the most exact and freshest information, has been made by the RURAL NEW-YORKER, which is the first and as yet the only agricultural journal that has a farm as a part and parcel of its editorial office and as a laboratory or work-shop in which the editor can test and experiment on and prove certain important questions which arise, and which require actual demonstration in the field and garden for their accurate solution. The experimental farm is, in fact, as necessary now to an agricultural journal as the telephone and the telegraph are to the ordinary newspaper. The Rural Farm is, in fact, the only experimental farm in complete and successful operation in the State of New York. Its purposes and mode of management may perhaps best be learned from an account of a recent visit to it.

It is located on Long Island, within sight of, and, in fact, bordering upon, the Atlantic Ocean. It is a quite level tract of sandy and gravelly soil, neither rich nor poor, but in such moderate condition of fertility as to show in a very marked manner the action of manures and special fertilizers. The farm is devoted wholly to the experimental growth of plants, vegetables and common farm and garden crops. [It may be well to remark that fruits of all kinds, including grapes, strawberries, raspberries, currants, blackberries, and all ornamental trees and shrubs hardy enough to endure the climate, are tested at the "Rural Grounds," situated in Bergen County, New Jersey, 18 miles from New York. For such purposes the Rural Farm is not well adapted.—EDS.]. New varieties of seeds are sought and tested; promising varieties are crossed in the hope of producing some improved sorts, and new methods of cultivating and fertilizing are tried. All sorts of questions which may arise in the actual practical working of a farm are here encountered and solved so far as the opportunities of time and place and soil will permit. Upon starting on a tour over the farm one might see a crop of millet sown to test its value as a feeding crop or as a green manuring crop, and also its availability for this purpose upon soil in ordinary condition. Then follow strips of different kinds of sorghum; the "Wild Corn of America," the Soja Bean; a row of enormous peas [Telephone.—EDS.]; rows of many kinds of sweet corn to test their earliness and comparative value. Potatoes, cabbages and other garden vegetables were next met with. Large plots of field corn, each under some special condition, which will doubtless soon be described and the results related in the columns of the RURAL, were then examined. Plots of many different kinds of wheat, of oats, of wheats crossed with other varieties to produce new kinds, followed. All this is very easily related, but the time and attention required to give even a cursory notice to all these things are by no means trifling.

But what days and weeks of labor and thought were involved in the actual work done—in the scores of plots, small and large, all staked and numbered to correspond with records made in a book so that every result could be set down without mistake and verified. This work necessarily falls upon the editor, who undertakes to control it; it is his actual hand-work as well as head-work which is necessary for the fulfillment of all the purposes for which the work is done; for experimental work cannot be delegated to a hired man or even to an assistant. It is as much the editorial work of the editor as the writing out of the results when they have been ascertained, or the first conception of the work that is to be done.

It is not difficult to perceive the great practical usefulness of such a work; of the accumulated years of waiting for success or for failure in work which it may save to numbers of individuals who might feel desirous to make the same sorts of experiments and to test and prove the same sorts of questions. It makes the journal, which is intended for "the Farm, and Garden, for the Rural and Suburban Home," a real, practical thing; precisely what it is intended; in fact, a medium for conveying fresh, precise, true and accurate news of events in the farm, garden and orchard as soon as they occur and as they may happen. The readers of the RURAL NEW-YORKER are certainly to be congratulated upon having all the benefits which may accrue from such a farm and such a work in the hands of an intelligent, earnest and most persevering experimenter and careful worker.

The Rural New-Yorker employs special artists and presents portraits from life of farm animals, rural architecture, farm helps, new fruits of all kinds, new grains and garden plants. Six hundred engravings, or thereabouts, are published annually.

International Exhibition.

MELBOURNE, AUSTRALIA. The competition in Sewing Machines proved very keen, and great interest was evinced both by representatives of the makers and the public in the result of the trials.

The machines were removed from the stand and were submitted privately to the Jury, and their various qualifications explained by skilled operators. The Jury then retained possession for some time, and at their leisure examined the workmanship and material, testing the latter for hardness by use of a file.

Among Domestic Machines the highest place was awarded to a machine comparatively new in the Melbourne market, though by no means untried elsewhere, and known as the *Davis Vertical Feed Sewing Machine*.

In this machine the feed apparatus is entirely removed from the usual position beneath the table of the machine, and is attached to the head.

It consists mainly of a vertical bar placed close to the presser foot and which receives suitable vertical and horizontal motion from mechanism contained in the head of the machine.

We find the other points entirely novel.

FIRST. The presser foot, instead of being continuously urged downward upon the work, is lifted slightly at the instant that the forward motion takes place.

SECOND. The feeding is accomplished while the needle is in its lowest position, and the needle partakes of the forward motion of the feed bar, pinning the two plies together and causing both to advance equally.

The machine is also provided with a very complete series of adjustments for counteracting the effect of wear, and an improved automatic bobbin winder, and in all its details is carefully and judiciously worked out.

Owing apparently to its peculiar feed motion the Davis machine possesses an astonishing power of passing over seams and other irregularities, and accomplishes with the greatest ease a remarkable wide range of work.

It is also provided with a very ingenious and novel set of attachments adapted to work in unison with the new feed motion and enabling very complicated operations to be performed with facility, and in many cases dispensing altogether with the necessity of guiding the work by hand.

It was at first supposed by the jury that this excellent performance was in some measure due to the special skill of the operator. This view was, however, entirely negatived by the fact that a change of operators in no way impaired the result.

The Davis machine is made for either foot or hand power, and performed equally well in each case.

To it the Jury awards the first order of merit as being prominent for simplicity, convenience, efficiency and rapidity both as a treadle and hand machine. W. C. KERNOT, Chairman Jury 37.—*Adv.*

The Salvator for Invalids and the Aged. An Incomparable Ailment for the Growth and Protection of Infants and Children. A Superior Nutritive in Continued Fevers, and a Reliable Remedial Agent in all Diseases of the Stomach and Intestines.

THIS justly celebrated Dietetic Preparation is, in composition, principally the GLUTEN derived from the WHITE WINTER FLINT WHEAT CEREAL, a solid extract, the invention of an eminent Chemist. It has not only been highly recommended but certified to by a large number of chemists and physicians—representing a very high degree of medical science—as the SAFEST, MOST ACCEPTABLE and RELIABLE FOOD for the GROWTH and PROTECTION of INFANTS and CHILDREN and for Mothers lacking Sufficient Nourishment for their offspring.

Unlike those preparations made from animal or vinous matter, which are liable to stimulate the brain and irritate the digestive organs, it embraces in its elementary composition—

That which makes strong Bone and Muscle. That which makes good Flesh and Blood. That which is easy of Digestion—never constipating. That which is kind and friendly to the Brain, and that which acts as a preventive of those Intestinal Disorders incidental to Childhood.

And, while it would be difficult to conceive of anything in Food or Dessert more Creamy or Delicious, or more Nourishing and Strengthening as an aliment in Fevers, Pulmonary Complaints, Dyspepsia and General Debility, its Rare Medicinal Excellence in all Intestinal Diseases, especially in

Dysentery, Chronic Diarrhœa and Cholera Infantum,

HAS BEEN INCONTESTABLY PROVEN.

MOLINE PLOW CO.

MOLINE, ILL'S. TRADE MARK.

REGISTERED MAY 9 1871

Plows, Cultivators, Harrows, Scrapers,

Moline Sulky, Western and Imperial Cultivators.

THE IMPLEMENTS manufactured by the Moline Plow Company are noted for strength of construction, superiority of finish, durability, and qualities which insure perfect work in any condition of soil.

THE MOLINE SULKY PLOW maintains its leading position as the simplest, most durable and lightest draft Sulky in use. It has made an unequaled record, which will be sustained by the adoption of every improvement which long experience and constant study may suggest. *THE MOLINE* is so simple and easy to handle that it can be managed by a boy, while it has been proved in the most careful and thorough field trials to be of lighter draft than an ordinary walking plow.

FARMERS who want the *BEST*, and therefore the *CHEAPEST*, will make no mistake when they buy a plow or a cultivator bearing the brand of the Moline Plow Company.

DEALERS find that merit always wins, and a large and constantly increasing trade follows the introduction of the Moline Plow Company's goods.

A Handsome and Valuable Premium for Every Reader of this Paper.

We wish to send evidence of the superiority of our implements to every reliable, practic. farmer in the country. We have published a handsome work of art in the shape of an *ALLEGORICAL FAMILY RECORD*, representing by appropriate scenes the Journey of Life, from the Cradle to the Grave. It will be furnished free to applicants on one condition only: On receipt of a list of names of good reliable farmers, with the full Post Office address of each, we will forward to the person sending the list one copy of the Family Record free of charge.

Our Annual Pocket Diary and Memorandum Book, with full supply of illustrated descriptive circulars, sent free to any farmer on application. Address,

A farmer's mill. It has no equal. Can be run either by hand or power. Will grind 35 to 50 bushels of apples per hour and the Press will press 75 gallons at a pressing. Send for large illustrated list of cider machinery.

THE HUGHES CASTOR TOOTH HARROW.

The best Harrow for seeding down in the market. Do not fail to obtain circular with full description.

CLARK'S IMPROVED ROOT CUTTER.

Perfection Obtained in Cutting Roots.

This Cutter has *received* the First Premiums *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five steel knives* [gouge-shaped], so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are easily cut in pieces suitable for feeding. No coarse, ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work. Don't fail to examine it.

We are manufacturing three sizes, designated by numbers,—1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter, and will cut 100 bushels per hour.

Price,	No. 1,	$12.00
"	No. 2,	14.00
"	No. 3,	22.00

Do not forget one thing; that we are the largest manufacturers of agricultural implements in this country. Plows, Harrows, Cultivators, and in fact everything in this line.

The Higganum Mf'g. Corporation,

HIGGANUM, CONN., U. S. A.

THE SHARPLESS STRAWBERRY.

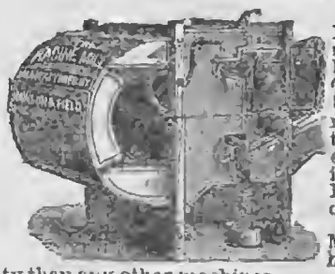
WE are always glad to see first-rate reports respecting the Sharpless Strawberry which the RURAL was among the first to test and recommend to its friends. Mr. A. M. Purdy, of Palmyra, N. Y., says that, *without a single* exception, it is the largest strawberry on his grounds, and he cultivates all sorts. He also says that it is the most solid and luscious to eat out of hand. When nearly all others, except Glendale and Kentucky, were gone, the Sharpless vines had a splendid show of green and ripe fruit, promising to yield for a week or ten days longer. When most other kinds sold for seven or eight cents, the Sharpless sold readily for 10 or 12. Mr. Purdy says that its yield with him is simply enormous, the ground along the rows being literally *covered* with the large, beautiful fruit and the pickers can gather a quart of them more quickly than of any other kind. Ellwanger & Barry, we believe, were the first to offer the Sharpless for sale. It has always done well at the Rural Experiment Grounds, the vines remaining strong and healthy while others in the same plot have proven comparatively feeble and unproductive.

WE presume there are few readers who will not find something to interest them in our new premium list. It will offer valuable presents to all who send us subscribers, whether two, a dozen or a hundred.

Among the forty-five kinds of different plants and seeds introduced or disseminated among our subscribers free, may be mentioned those which have now passed into general cultivation, viz.: The Beauty of Hebron and White Elephant Potatoes; the Cuthbert Raspberry; Blount's White Prolific Corn; Mold's Ennobled and Washington Oats; Clawson Wheat; the Rural Branching Sorghum; Argenteuil and Giant Red Dutch Asparagus; Telephone Pea, Acme Tomato, &c., &c.

The Racine Farm and

Warehouse Fanning Mills.



These Celebrated Mills have long been used by the Most Prominent Millers & Grain Dealers in the United States, who recommend them as the Best Machines ever produced for cleaning Corn, Oats, Wheat, Barley, Grain & Seeds of every Description. RUSSELL & CO., Massillon, Ohio.

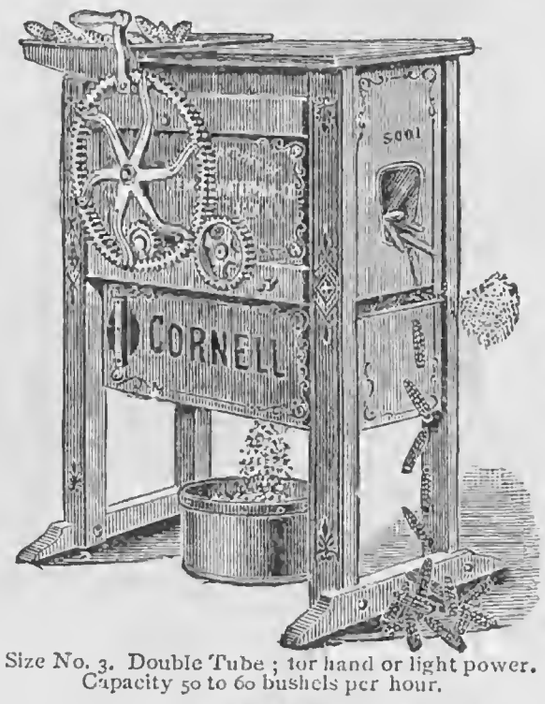
The Cornell Patent and Ithaca Shellers.



Size No. 3. Double Tube; for hand or light power. Capacity 50 to 60 bushels per hour.

Will shell more Corn in the same space of time, with less labor, than any other machines in the market.

THE CORNELL

Is the only Corn Sheller made that uses

Spiral Springs for the Pressure Bar,

THE ADVANTAGES OF WHICH ARE OBVIOUS:

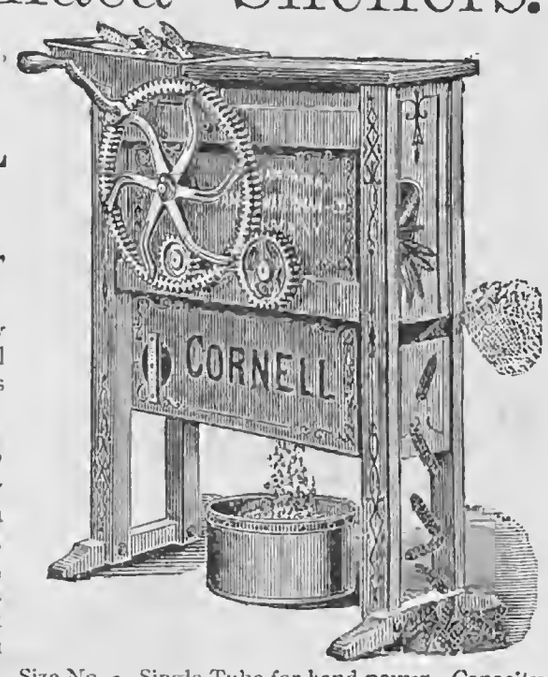
It acts quicker; conforms itself more readily to the shape of the ear; will shell equally well throwing corn in large end as well as small; is very easily and readily adjusted.

Every Machine has an Iron Hopper Attached, which facilitates the feeding. Throat is very large; will take in the largest corn grown; in fact, will shell anything from Pop Corn to Dent.

The Ithaca Sheller is an entirely new machine, and is the best low-priced machine in the market.

These Shellers have been awarded the First Premium at every Fair where they have been exhibited. They are fully warranted.

Be sure and send for Circulars to



Size No. 2. Single Tube for hand-power. Capacity thirty bushels per hour.

THE CHAMPION IMPORTED BREECH-LOADING SHOT GUN.

THE BIGGEST BARGAIN EVER OFFERED.

A $20 BREECH-LOADING GUN FOR $7.00.

NEW, PERFECT, FRESH FROM THE FACTORY AND GUARANTEED IN EVERY RESPECT. EVERY ONE THOROUGHLY TESTED AT FACTORY BEFORE EXPORTATION.

Owing to the failure of the LONDON & LIVERPOOL FIRE ARMS CO., of London, England, we have secured a consignment of their celebrated Breech-loading Shot Guns THE CHAMPION, at thirty-three and one-third cents on the dollar of the actual cost of manufacture. One hundred thousand stand of these Guns have been thrown on the European and American market, only a small portion of which have come to America. These we have secured entire control of and offer them for the purpose of introduction at less than cost of manufacture until NOV. 15th, 1881, when the price will be advanced to the regular rate $20.00 each. This Shot Gun fills the long-felt want for a reliable Breech-loading Shot Gun at a reasonable price. The country has been flooded with cheap, worthless American Fire-arms, made of inferior material miserably put together, and as far as reliability or accuracy are concerned perfectly useless. THE CHAMPION is now and perfect, finely finished, case-hardened and blued, made of very best materials, and by the improved Attachments, as shown in cuts Nos. 1 & 2, are rendered superior to any other English or American Shot Gun. They are too well-known to need extensive description, when we state that they are perfect, and warranted Genuine CHAMPIONS, that is sufficient. Every Man or Boy in this country who needs a Shot Gun should purchase one of THE CHAMPIONS, as they are the Biggest Bargain ever offered in America, and will never be offered again. We GUARANTEE these Shot Guns to be in every respect as represented or Money will be refunded. You cannot let this opportunity slip if you want a Shot Gun, and as a chance for speculation it is well worth your attention. You can at any time sell the Shot Gun for a great deal more than you gave for it. THE CHAMPION is a great favorite with Sportsmen on account of the rapidity and ease with which it can be loaded, and its superior Shooting qualities. That it stands unrivaled, as a first-class Fire-arm, is shown by the thousands of English testimonials on file. The editor of THE ATLAS (N. Y.) says: "*They are the most extraordinary bargains I ever saw. They shoot equal to my* $90 *Scott Gun.*" He has bought two. R. E. Reed, Secretary of the New York Ducking Club, says: "*Your CHAMPION IMPORTED BREECH-LOADING SHOT GUN is an unheard-of Bargain and worth at least* $20.00. *Our Club will have several. I heartily endorse your assertions; this Shot Gun will more than satisfy every purchaser.*" ORDER AT ONCE as our consignment is only ONE THOUSAND and our limit is NOV. 15th, 1881.

TAKE NOTICE—We will send (until Nov. 15th, 1881,) ONE CHAMPION IMPORTED BREECH-LOADING SHOT GUN as described above, carefully boxed, for $7.00, and when Cash accompanies the Order will give Free one of our new Sportsman's Cartridge Belts, as shown in cut, also 50 Reloadable Shells.

Send Money by REGISTERED LETTER or POST-OFFICE ORDER at our Risk. Or we will send the Gun C.O.D. with privilege of Examination upon receipt of $2.00 to cover express charges, or your express agent's guaranty that the Gun will be returned free of all expense to us if not taken by you, but we do not send the Sportsman's Belt or Reloading Shells if sent C.O.D., as this extra inducement is to those who send CASH WITH ORDER. Should you have no acquaintance with our Firm, and desire a reference as to our reliability, we would refer you to any Mercantile Agency, Express Company, Bank or Newspaper Publisher in this City. ORDER NOW, even if you have no use for a Gun for six months; you never will get another such Bargain. Address E. G. RIDEOUT & CO., 10 Barclay Street, New York.

SPECIAL OFFER.—If you will get a Club of Five and send us $35.00 we will send YOU one Gun free for your trouble.

HINTS.

Hanging baskets are the best watered by plunging them in a bucket or tub of water, and allowing them to get thoroughly soaked through.

It will be found that a whisk-broom will materially facilitate the dampening of clothes, which is a matter that should receive careful attention if the ironing is to be well done. This mode of operation may often be seen put into practice by the Chinese—the great laundry-"ites."

THE Marlboro Seedling—a large, red, high-flavored raspberry, and the Skowhegan, a prolific Black-cap, promise to share a part of the public attention in the near future.

ONE ounce of salicylic acid to a barrel (32 gallons) of cider suffices to keep it sweet for a year. The acid should be put in the sweet cider and mixed well. Bung up and it will not ferment.

THE RURAL NEW-YORKER wants agents EVERYWHERE. The work, we think, will be found easy, and an examination of our premium list will show it to be very profitable.

The Rural New-Yorker is for the progressive, thoughtful, industrious farmer and gardener in every part of the country; for the suburban and country home; for the North, South, East and West. It is conscientious, sparkling, original, practical. It will instruct and interest every member of the household. It is conducted in a way that inspires the unqualified trust and respect of its readers. Specimen copies sent post-paid without charge that all may have an opportunity of judging for themselves.

BLUNDERS AT FAIRS.

A LITTLE incident occured at a fair in Rutland County, Vt., that seems almost too good to be lost, and shows the necessity of appointing judges that know whereof they judge. The facts are these :—A gardener of some notoriety carried several articles to the fair and among them beautiful specimens of the Egg Plant. The judges inspected the articles and very wisely awarded the gardener the first premium on a new variety of turnips, supposing they knew all about the Vegetable Kingdom. Our fairs ought to be so managed that ignorant blunders of this kind can be avoided. A. H. C.

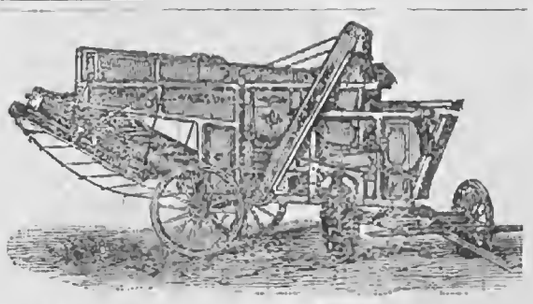
Rutland, Vt.

The above paragraph, clipped from the RURAL of 1879, is a specimen of the vexatious blunders which occasionally occur at our Fairs. I know of one instance where a man entered a colt, but neglected to exhibit him: nevertheless, he received the first premium for the best colt. At our County Fair a man was awarded the first premium for the best "six specimens of the Newtown Pippin", which, upon tasting, proved to be under-sized and poorly colored Pound Sweets. Such blunders, though rare, are very annoying, as they give growlers a pretext for fault-finding.

It is often difficult to find good judges at fairs, as the most competent persons generally desire to compete for the premiums, the doing of which, of course, renders them ineligible to act as judges. Nearly every intelligent fruit grower, cattle breeder, etc., desires to make an exhibit, so that the most competent are effectually ruled out, and the duty devolves upon others less competent. The wonder is, not that so many mistakes are made, but rather that blunders occur no oftener. Another difficulty is, that many persons, when appointed as judges, fail to appear and thus compel the officers to fill their places at so late an hour that the question of fitness cannot well be considered.

If a man is requested to act as a judge, he should forego the pleasure of competing for the premiums (entering his product as an exhibit only), and thus act for the public good. Those appointed should act, if possible, and if impossible, they should notify the Secretary in time to allow him ample opportunity to properly fill their places.

If those who do nothing at our fairs but find fault with what others do, would take hold themselves, everything would probably be satisfactory. NELSON RITTER.



Butterworth Thresher

Is a strictly FIRST-CLASS MACHINE, and the best in the market. It threshes complete, and beats them all in cleaning and saving the grain. Wherever there is threshing to do, an enterprising man with this machine is sure to take the lead and secure a steady run of work. They are made in sizes to suit Steam, Lever or Tread Power. For Circulars address JNO. BUTTERWORTH, Supt. New Jersey Agricultural Works, Trenton, N. J.

DEDERICK'S HAY PRESSES

are sent anywhere on trial to operate against all other Presses, the customer keeping the one that suits best. No one has ever dared show up any other Press, as Dederick's Press is known to be beyond competition, and will bale with twice the rapidity of any other. The only way inferior machines can be sold is to deceive the inexperienced by ridiculously false statements, and thus sell without sight or seeing, and swindle the purchaser. Working any other Press alongside of Dederick's always sells the purchaser a Dederick Press, and all know it too well to show up. Address for circular

Baltimore, Md., U. S. A.

SOME PEOPLE

are fair-minded; to such we refer the scale question. For many years a great monopoly owned the patent and amassed millions of dollars. When the patent expired the invention became public property, and one has a legal and moral right to make Fairbanks' Scales. There are some dozen companies making "genuine" Fairbanks' Scales, genuine because they are the exact scale invented and patented by Fairbank. The value of a scale should be determined, not by the name of the maker or the price, but by its accuracy and durability, resulting from the use of good material by the skillful mechanic. While this famous patent existed the price of a Five-Ton Wagon Scale was $25, now *as good* a scale is made and sold, at a living profit, for $60, by Jones of Binghamton, Binghamton, N. Y.; and Jones he pays the freight. This is fair competition and should be met in an honorable manner, but instead resort is had to every species of *misrepresentation, outright falsehood, contemptible meanness, bribery and conspiracy* and we hold the head of the Fairbank Co., ex Gov. of Vermont, the high-toned Christian Gentleman, noted for his liberality to Church and Sunday School, responsible for the rascality of his employees, for he pockets the ill-gotten gains. We appeal to any one who has ever had any conversation with a Fairbanks' Scale Agent, relating to the Jones Scale, to substantiate our statement. They have succeeded in deceiving many into paying double price, and no doubt have lied us out of many thousand dollars, but we have prospered simply because we have kept faith with our patrons, sold them a good scale at a fair price, and done just as we agreed every time. The smooth-tongued liar will tell you the Jones' Scale "ain't good for nothin'," but that won't induce any fair-minded person to reject the testimony of many thousands who have used the Jones' Scale—some for nearly twenty years. Jones asks no money till the buyer has had an opportunity to try his scale and see that it is as represented. Every Jones' Scale is warranted for five years, and no man can say that Jones ever failed to make his warrant good. Remember Jones pays the freight and takes all risk of loss or breakage on the way. An attempt is often made to deceive by the claim that a scale is the U. S. Standard, meaning to convey the impression that the government has something to do with it, which is not the fact. Any scale, by whomever made, that is correct according to the weights adopted by the government, is just as much a U. S. Standard as any other. Every one who has any interest in Scales should address JONES OF BINGHAMTON, Binghamton, N. Y., for free Book on Scales, which gives prices of all sizes of Scales and other valuable information.

A GOOD SAW MILL
For $200.

Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day—a product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill with the same power. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc. Illustrated circulars sent free.

TRADE MARK.
LITTLE'S CHEMICAL FLUID
The New Sheep Dip
NON-POISONOUS, NON-CORROSIVE

MORRIS LITTLE & SON, Prop'rs and Man'f'rs.

A highly concentrated liquid for dipping or washing **Sheep,** cattle, horses, dogs, pigs, fowls, etc., Killing **Ticks,** lice, fleas, maggots, all insects and internal parasites. Curing **Scab,** foot-rot, mange, sores, wounds, etc., preventing scratching and pulling, promoting the growth of wool and flesh, and for other purposes.

One gallon makes "Dip" for 200 Sheep for Ticks, and for at least 50 Sheep for Scab.

Does not require heating or any preparation. Simply add **cold** water, and it is ready for use; is self-mixing, easily applied, and always effective. Usable in full fleece or when shorn, and safely applied in **Winter.** Is of a warm and protective nature, and does not wash off in stormy weather. Makes the skin soft and loose, the wool clean, lustrous and silky, and develops that bright bloom so much prized by flockmasters. Increases flesh. Repays cost four times over. Harmless to animal, person or clothing, and available for internal use, being positively non-poisonous and non-corrosive. Its high concentration renders it easy and cheap to transport. It is superior to any other "Dip" in all respects, having every good quality without any disadvantage whatever, and the cost is less. It is also a "fly" and sown-seed protector, and a fertilizer, etc., etc.

Cheap, Harmless, Clean, Pleasant, Convenient, Rapid, Infallible.

Officially tested by Government analysis. Awarded "Diploma" of "New England Agricultural College" a Diploma for my exhibit at the International Exhibition of Sheep and Lambs, Philadelphia, Sept., 1880. Endorsed by American Agriculturist; sample supplied by me to Dr. Thurber, Sept., 1879, and to R. D. H. Halsted, associate editor, Sept., 1880; Rural New-Yorker, Henry Stewart, Esq., N. J., author of "The Shepherd's Manual," H. J. Chamberlain, Esq., Texas, on samples supplied by me to each of them, and many other leading authorities.

Price $1.80 per gallon; $1,65 for 10 or more gallons. Shipped in Barrels, or boxed Cans.

T. W. LAWFORD, Gen'l Agent, Baltimore, Md., Box 504.

My agency established April, 1879. Prospectus containing U. S. testimonials mailed free. Mention this paper.

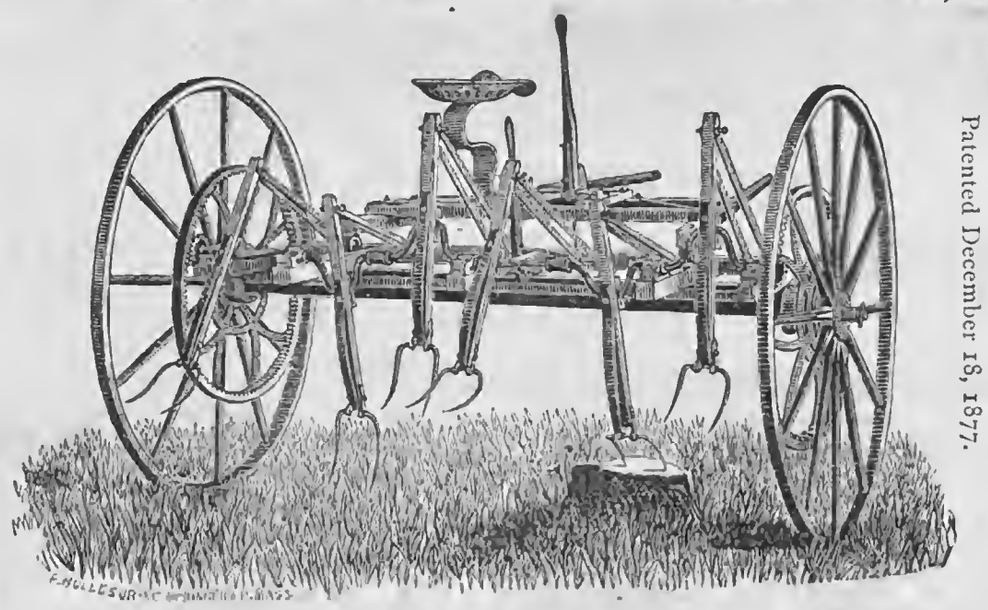
THE MUDGETT HAY TEDDER,

WITH IMPROVED FORK.

Patented December 18, 1877.

Five Hundred in use and no broken Fork. Undeniably the lightest draft and best working machine in the Market.



The forks are attached to the handles in such a manner as to render breakage almost impossible. The advantages we claim for this machine over all others, are: FIRST, The fork. A careful study of the cut will show the working of it plainer than it can be described. SECOND, On account of the peculiar construction of the fork, it can be run closer to the ground. If it strikes the turf, or an obstruction of any kind, it slides over instead of digging into it. THIRD, For the same reason it will run one-third lighter than any other. FOURTH, Because of running closer to the ground, it will do better work than any other. FIFTH, It will work equally well in heavy or light grass. SIXTH, It has higher wheels than any other.

Circulars free. Address *B. & J. W. BELCHER, Chicopee Falls, Mass.*

The Bookwalter Engine.

These Engines are made of the very best material, by first-class workmen, and are just what we guarantee them to be—safe, simple in arrangement of parts, durable and complete in every particular. Thus they are adapted to the wants of the

Planter for running a Cotton Gin or Corn Mill, the Mechanic for Driving Small Machinery, the Farmer for doing almost anything requiring power.

The simplicity of their construction enables any one with ordinary intelligence to operate one safely. They are made for durability—yet every part liable to get out of repair can be easily replaced by any mechanic, or duplicates can be secured at reasonable rates. We quote the following:

Extra Low Prices for first-class Engines.

3	horse power Engine and Boiler with pump and governor,	$240
4½	" " " " " "	280
6½	" " " " " "	355
8½	" " " " " "	440

Each Engine is warranted to have fully the power given above. We give the purchaser 30 days for a satisfactory trial, or money refunded. Send for a fully illustrated descriptive catalogue.

JAMES LEFFEL & CO., Springfield, Ohio.

VICTOR 3 AND 5-HOED ONE-HORSE DRILLS.

MANUFACTURED BY

EWALD OVER,

Indianapolis, Ind., U. S. A.

THE VICTOR FIVE-HOED DRILL, is the lightest and strongest one-horse drill in the market, weighing only 125 lbs. It is strong, simple in construction, of light draft, can be expanded and contracted for five different widths, varying from 6¾ to 8½ inches from tooth to tooth. It has a splendid Force Feed and will do more than half the work of a two-horse drill. It is provided with BRAKE-PIN TEETH which are especially adapted for stony or stumpy ground. For sowing Rice the intermediate teeth are removed, making it a three-hoed drill, sowing rice in rows 13½ to 17 inches apart. This drill can also at a very small expense be changed so as to drill two rows of CORN for ENSILAGE purposes, 27 to 34 inches apart. This drill can be readily adapted to plant COTTON, as was shown by actual experience in Mississippi last spring.

Victor Drills are used for sowing wheat, oats, rye, barley, rice and cow peas in fallow ground, or wheat in standing corn. They are fast taking the place of two-horse drills. Will name special prices on application.

THE THREE-HOED VICTOR is used for the same purposes as the five-hoed, and is better adapted for hilly and rough ground and new land. It weighs only 80 lbs., and teeth are 7½ inches apart. By removing the middle tooth or omitting to put grain into centre partition of seed box, you have a two-hoed drill.

The best Horse Power in the world for running Feed Mills Feed Cutters, Corn Shellers, Saws, Elevators, Churns, Pumps, Cider Mills, Fanning Mills, Meat Choppers, Cotton Gins, Broom Corn Machinery, etc. Send for circulars to the TAYLOR HORSE POWER Co., 23 So. Canal st, Chicago.

THE PLANET JR. COODS.

Let every man, woman, and child whether interested much or little in working the soil, send now for our carefully written Catalogue. We want all farmers who value labor-saving tools to study out our combined Horse Hoe, Cultivator and Coverer; Market Gardeners, who have acres upon acres on each of which our Double Wheel Hoe will save its cost yearly, to examine the merits of our fine garden tools; and every one who has even a small vegetable garden to read closely what the Firefly Hoe and Garden Plow will save them. **S. L. ALLEN & CO., 127, 129, Catherine St., Phila'a, Pa**

HUMOROUS.

A COLORED preacher, in translating to his hearers the sentence, "The harvest is past, the Summer is over, and we are not saved," put it: "De corn has been cribbed, dere ain't any more work, and old Satan is still foolin' wid dis community."

A YOUNG man, pale and visibly agitated, hurriedly entered a drug store late one night and accosting the clerk, said: "Give me an ounce of chlorate of potash, will you, as quick as you can?" Observing his perturbation, the clerk ventured to ask: "What's your hurry?" "Why, I've been kissing our Sunday-school teacher since nine o'clock, and she didn't tell me till ten minutes ago, that she was afraid she had the diphtheria."

"TOMMY, did you hear your mother call you?" "Corse I did!" "Then why don't you go to her at once?" "Well, yer see she's nervous, and it'd shock her awful 'f I should go too suddent."

A QUEER looking character went into one of our dry goods stores and inquired the price of a yard of ribbon. The clerk informed him that the price was six cents. "Sixteen? I'll give you fifteen." "I did not say sixteen, I said six cents," said the clerk. "Oh! six cents. Well, I'll give you five," was the reply.—Peck's Sun.

THIS notice is found posted up in a Virginia blacksmith shop: "Notis—De copartnership heretofore resisting betwixt me and Mose Skinner is hereby resolved. Dem what owe de firm will settle wid me, and dem what de firm owe will settle wid Mose."

Prof. W. J. Beal, of the Michigan Agricultural College, says "The Rural New-Yorker is now the best paper."

Unhappy predicament of little John at the Fair, when pa and ma are both struck at the same time with different objects of interest.

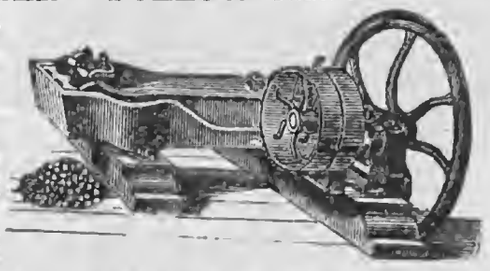
CHEAPEST AND BEST FERTILIZER---FOLLOW NATURE.



Which USES GROUND RAW LIMESTONE in MAKING THE SOIL. There were no Lime Kilns around burning lime when the good **Limestone Farming lands** were originally made. Every Farmer can prepare his own Fertilizer with an **ordinary Horse Power** by using **FORSTER'S COMBINED CRUSHER & PULVERIZER**, which takes a lump of Limestone three to five inches square, and Crushes and Pulverizes it in **one operation**, same as flour's. Farmers use the Ground Raw Limestone, and drill and sow it just as it comes from the machine. W. W. Reed, of Erie, has tried it 6 years, and says it shows a profit over Bone Dust of $1.96 per acre; over Phosphate of $6.28 per acre; over Guano of $9 70 per acre; over Salt of $5 9) per acre, **and that it will last twice as long.**"—John G. Bear, of Montgomery, Lycoming Co., says: "I believe it to be the cheapest and best Fertilizer in this country. *It is worth three times as much as Burnt Lime, and with this machine does not cost half as much as Burnt Lime to make.*"—H. C. Falls, New Castle, Pa., says: "I used the Ground Limestone last year with great satisfaction as to results, and cannot too strongly recommend it for farm and garden purposes Where I dropped my corn on top of it, the corn came up first, and was strong and thrifty—the Limestone drawing the moisture to the roots. Used in place of Paris green on Potatoes, it kept the Bugs away and made the plants thrifty and strong; being washed into the ground, it benefited the Potatoes in an astonishing manner. Address only **TOTTEN & CO., Pittsburgh, Pa.** ONLY MAKERS.

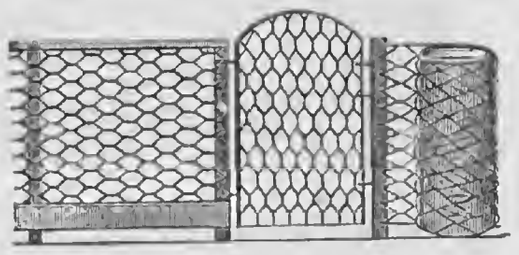
BOLSTER SPRINGS FOR FARM WAGONS.
Made of Best Oil Tempered Steel.
The ONLY RELIABLE Bolster Spring in Use.

SIMPLE AND SATISFACTORY.

They save largely from wear and tear in every part of the Wagon. They remove all necessity for a Spring Seat. They convert a common Lumber Wagon into a Spring Wagon, making it equally comfortable for from one to twenty persons. They are admirably adapted to the wants of Fruit and Vegetable Growers. They are suited to all makes and sizes of Farm Wagons, and can be attached by any one. They make the cheapest and easiest riding Spring Wagon in the market. These Springs have been in practical use for over four years, and are a pronounced success. No Teamster or Farmer can afford to be without them. We want Agents everywhere. Send for description and prices, and mention this paper.

SEMPLE & BIRGE MFG. CO., ST. LOUIS, MO.



The Sedgwick Steel Wire Fence

Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every respect, and far better than barbed wire. We ask for it a fair trial, knowing it will WEAR itself into favor. The SEDGWICK GATES, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the BEST and CHEAPEST ALL IRON Automatic or SELF-OPENING GATE. Ask hardware dealers, or for price list and particulars address

MERWIN, HULBERT & CO'S AUTOMATIC REVOLVERS

38 and 44 Calibre.

CUT SHOWS

Pocket Army, 44 Cal. Win.

We call special attention to our Pocket Army. In its construction the best materials and highest known state of the art have been applied. For precision, penetration, poise, compactness, beauty of outline, and general convenience, IT HAS NO EQUAL. The crested form of the handle permits it to be of less size than any arm of this calibre, the lines of recoil and resistance are closer together, a more firm and natural grasp, and much greater leverage are given to the hand, all of which tends to resist the upward throw of the barrel in firing. To separate the frame, barrel and cylinder, (for cleaning,) and re-assembling them, requires no tool.

Address: Merwin, Hulbert & Co., New York City. U. S. A.

THE MAPES COMPLETE MANURES.

SPECIAL CROP MANURES.

Remarkably LARGE and PROFITABLE crops grown during the past season, without stable manure and with ordinary field culture. Season 1880.

CORN—63, 106, 125, 134 and 159 Bushels shelled Corn per acre, on poor and ordinary lands. For full reports, cost per bushel, etc., see pamphlet, pages 5, 6, 7. Also RURAL NEW-YORKER, Corn Number, Jan. 1st, 1881, pages 1, 2, 3.

These unprecedented crops are established beyond all doubt, by the testimony of many well-known farmers and agriculturists, including the following, who have examined the crops during the harvesting, and have made reports on the same:

Prof. A. B. LEDOUX, Director N. C. State Agricultural Station.
L. C. BENEDICT, Agricultural Editor of the New York World (Weekly).
Dr. WM. M. HABERSHAW, Chemist N. Y. State Agricultural Society.
HENRY STEWART, Agricultural Editor of the New York Times (Weekly).
ROBT. DODGE, Pres. Farmers' Club of the Am. Institute, New York.
E. WILLIAMS, Secretary New Jersey State Horticultural Society.
Dr. F. M. HEXAMER, Editor of the American Garden.
Mr. BRUGGERHOFF, of Thorburn & Co., New York.

See extracts from the RURAL NEW-YORKER, NEW YORK WORLD, NEW YORK TRIBUNE, NEW YORK TIMES AMERICAN GARDEN, COMMERCIAL WORLD, etc., in pamphlet, pages - - - - - - 1 to 4.

POTATOES—200, 300 and 400 bushels Potatoes per acre, see pamphlet, pages - - - - 9 to 11.
SUGAR BEETS, 37,600 pounds per acre, see pamphlet, page - - - - - - - - - 32.

The above crops were all grown EXCLUSIVELY with the Mapes Special Crop Manures.

1,180 1-2 bushels Wheat on 36 acres. Average about 33 bushels per acre. On 19 acres, average 40 bushels per acre.

Report of W. S. COMBS, Freehold, N. J., on 36 acres of Wheat, grown with the Mapes Complete Manure for Heavy Soils.—April 26, 1881.

Acres sown 36, nineteen of which was stubble and seventeen stiff timothy sod; variety sown, *Fultz*, about two bushels per acre; soil a pretty stiff clay.

TREATMENT.—30 acres, 500 lbs. per acre of the Mapes Complete Manure for heavy soils alone, 6 acres dressed with Stable Manure, about ten loads to the acre, and 500 lbs. of the same Complete Manure for Heavy Soils.

RESULT.—1,180 bushels and 37 lbs. of Wheat, and 45 tons of Straw when pressed. The quality of the wheat was good, weighing 62 lbs. to the measured bushel. The weather during and for weeks after sowing, was so exceedingly dry that the grain sown on the sod piece did not come up as evenly as that on the stubble, and as a result the yield from this piece reduced the average yield considerably. The yield from the 19 acres of stubble was (estimated, the two plots not being separated) 40 bushels per acre. The grain from the two pieces was harvested together, and when threshed was accurately measured and weighed. (1,180 bushels and 37 lbs. from the 36 acres, average 33 bushels per acre.)

About three weeks before harvest the army worm entered the field and marched directly across it stripping the leaves from the stalks and cutting off the smaller heads. They did considerable damage, just how much am unable to say.

Have sowed the whole 36 acres again with wheat, without the application of any manure or fertilizer.

QUICK ACTION. PERMANENT EFFECTS.

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

Vol. XL. No. 1650.} NEW YORK, SEPT. 10, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by The Rural New Yorker, in the office of the Librarian of Congress at Washington.]

WHEATS AT THE RURAL FARM.

HARD AUSTRALIAN.—Raised until last year as a Spring wheat. Sowed Sep. 19. Heavy, golden straw, four feet high. Heads four inches; eight breasts; three kernels to a breast; amber color. This kind we used extensively in crossing, both as a pollen and pistillate parent. Ripe July 14.

CHINA TEA.—Raised generally as Spring grain. Sowed Sep. 20. Short straw. Badly winter-killed owing, as we believe, chiefly to imperfect drainage. Best heads five inches; bearded, tapering, pointed. Eight breasts to a side, generally three kernels; amber, nearly red; of good size.

UNKNOWN.—This appeared in a plot of Defiance the seed of which has been confined to this farm for three years. The heads average three and a half inches; half-bearded; eight or nine breasts to a side, nearly three grains to a breast; of a clear white color half transparent. White chaff, bright straw. Promising. We should estimate the yield at over 30 bushels.

BLOUNT'S No 10.—Spring, a cross between Diehl and Golden Straw. Sowed Sep. 24. Straw heavy; heads average over four inches; eight breasts, and three kernels to a breast. Cut July 16. Kernels shriveled. The heads vary in form, some more resembling the Diehl in being larger at the top, others being pointed. Beardless.

WINTER MINNESOTA HARD FIFE.—Sown Sep. 19; 30 per cent. killed. Short straw. Heads three and a half inches. Beardless, narrow, pointed. Eight breasts to a side; two and a half kernels. Amber. Ripe July 14.

WHITE MEXICAN—(Spring). Sown Sep. 20; 75 per cent. killed.

PRINGLE'S HYBRID No. 6—(Spring). Sown Sep. 20; 85 per cent. killed. Long, narrow heads, slightly bearded, four and a half inches long—eight breasts. Long, white, narrow kernel. Ripe July 15.

NOT KNOWN.—Probably a Russian wheat. Heads three inches, nine breasts. Velvet chaff, shriveled kernel.

LOST NATION.—This was planted Oct. 5, two kernels one foot apart. The seed was selected from last year's Winter Lost Nation. Upon the entire plot but one plant, bearing two heads, survived.

LOST NATION.—Sowed Sep. 20 from Spring seed received from Prof Blount (Colorado.) A few plants only survived.

GOLDEN GLOBE.—Late as a Winter wheat. Straw three and a half feet high—golden. Heads bearded, narrow, pointed, three and a half inches long; seven breasts—two kernels, amber, hard. Ripe July 14.

SAXON FIFE.—(Spring). Drilled Sep 20. Straw four feet. Heads three and a half inches; seven and a half breasts to a side; two and a half grains to a breast. Soft, white. Beardless. Ripe July 15.

SOFT AUSTRALIAN.—(Spring). Drilled (all kinds were drilled, that is, none was broadcasted) Sept. 20. Fifty per cent. killed. Short straw, medium heads, beardless. Ripe July 14.

BLACK-BEARDED CENTENNIAL.—(Spring.) A remarkable grain in many respects and well worthy of trial. We are not aware whether this has or has not been hitherto cultivated as a Winter grain. It was sown here not until Sep. 28 and it passed through the Winter well. The straw was very strong and tall, remaining quite green for days after the heads began to ripen, and curving over—never breaking—under the weight of the heavy heads. Though late, the leaves were less affected with rust than those of most other kinds. While growing this is certainly one of the handsomest of wheats and might—except for its height—easily be mistaken for very tall barley, at a distance. The heads are very uniform in appearance and the spikelets close set and regular, as may be seen by the engraving, which is a true portrait. The beards are often six inches long, often turning black and falling off when ripe, leaving the head quite beardless. The heads average four inches, with ten breasts and nearly three kernels to the breast. The grains are short, fat, white, large and soft. It will appear that this wheat should yield heavily where it thrives. It was ready to cut not until July 26. We are still of the opinion that this is what was advertised last year by Haines & Co., of Philadelphia, as "Golden Grains", though the above firm ridicule our belief. Intent upon ascertaining whether it was or not, we wrote to Haines & Co., asking them if they would favor us with a history of "Golden Grains" etc. Their reply was that should they comply with our request we would then know as much about it as they did. We sowed a small quantity of Golden Grains last Spring. But few seeds germinated and those did not form heads. Hence it is we have called upon our readers to favor us with specimens.

NURSERY.—This is entirely hardy with us. The heads are pointed, three inches long, eight breasts, two and a half grains to a breast, white chaff and golden straw of medium hight and thickness. The grain is of medium size, white, soft. It ripens rather late—July 16.

DOMINION—(Spring.) Drilled in Sept. 20.: 75 per cent. killed. Heads three and a half inches long—eight breasts, three kernels, shriveled, amber color, dark chaff. Strong straw. Ripe July 15.

IMPROVED FIFE—(Spring). Sown Sep. 20. Hardy. Heads three inches; white chaff; six and a half breasts; two and a half kernels; white, hard, medium size. Straw four feet high; strong.

ODESSA.—Sowed Sep. 20. Straw three and a half feet high—variable. Narrow, pointed head, three and a half inches—eight breasts, two and a half kernels; amber color. Late; hardy. Dark chaff. Ripe July 15. Of little promise as to productiveness.

ZIMMERMAN.—Measured yield 21 bushels, one peck. One bushel and 18 quarts seed sown per acre. Straw four feet high, slender and elastic; red. Heads two and a half inches long—five breasts, two grains to breast. This was sent to us by Prof. Tracy of the Missouri State College. The grain is between red and amber and the heads are bearded. We have never before raised Zimmerman, but descriptions speak of it as a beardless variety.

WHITE FIFE.—Sowed Sep. 19. Hardy, late. Straw three and a half feet; strong. Heads three and a half inches—seven breasts, two and a half kernels. Amber kernels; white chaff—somewhat bearded. Ripe July 14.

ELDORADO—(Spring) killed.

CHILI—(Spring) Sowed Sep. 20. Badly winter killed. Heads three inches; two and three-quarter kernels to a breast—six and a half breasts. Kernels white, plump, good size. Ripe July 15.

SQUARE-HEAD.—Heads two inches long—larger at the top. About eight breasts. Grains white, medium size, plump. Three grains to a spikelet. Chaff falls readily.

TOUZELLE.—Sowed Sep. 20. Badly winter-killed. Bearded. Heads two inches long. Grains amber. We do not see that this kind has anything to commend it for cultivation in this climate. Ripe July 14.

OREGON CLUB.—(Spring.) Ninety per cent killed.

RUSSIAN NO. 8.—Same as Russian No. 10. See below.

EGYPTIAN.—See cut and description elsewhere. We have had several specimens of Eldorado sent to us as Egyptian. The former is a single spike, the latter a compound spike—hence the name of "Seven-headed," "Many headed," etc. We should be pleased to hear from our friends many of whom have sent us specimens of the Egyptian, as to its yield, flouring qualities, etc.

RUSSIAN NO. 10.—Sowed Sep. 20. Handsome heads, long beard. Very hardy. Heads four inches—eight breasts; two kernels. Ripens July 20. Dark chaff. Kernel rather long for its thickness; amber color; clean and plump.

RUSSIAN NO. 2. Beardless. White chaff. Short heads. Ripe July 12. There is little about this worthy of note.

WHITE ROGERS.—Drilled Sep. 20. Bearded; white chaff. Hardy. Heads two and a half inches; two and a half kernels, amber color.

OREGON. Two and a quarter bushels of seed were sown to the acre—the measured yield was 30 bushels. It is a bearded kind, with dark chaff and a dull-colored slender straw. Heads average two and a half inches—two and a quarter kernels to a breast and six breasts. Ripe July 12. The grain is very large; of an amber color. It is very hardy.

RUSSIAN No. 12.—Sowed Sep. 20. Straw four feet. Heads average over four inches; velvet chaff; nine breasts; two and a half grains to a spikelet. Very hardy. This promised a heavy yield, the heads being of good size and the breasts closely set. But it did not ripen until July 22 when the kernels were found to be shriveled and the yield not over 15 bushels to the acre. Not one of the ten kinds of beardless wheats with velvet chaff tried here has succeeded.

RUSSIAN No. 3.—Bearded—hardy. Eight breasts; two kernels, amber color. Chaff, light chestnut color; straw strong and of a bright golden color. Estimated yield not over 20 bushels.

SANDOMIRKA.—Twenty quarts of seed sown per acre. Yield (measured) 25 bushels per acre. Straw nearly four and a half feet high, slender but strong—often of a leaden color. Heads average three and a quarter inches; breasts two and a half kernels; six and a half breasts. Grain half transparent, rather small. The milling qualities of this kind of wheat are said to be of the best. Our seed was received from Mr. C. E. Thorne, of the Ohio State Agricultural College.

BROOKS.—(Spring.) Hardy. Sown Sep 20. Golden straw four feet high—slender, strong. Heads long, narrow, loose, about four inches in length, eight breasts, two and a half kernels. Ripe July 14.

GOLDEN STRAW.—Seed from Ohio State University. Three and one-eighth bushels were sown to the acre. Sep. 24. Yield 24 bushels. Straw four feet high, often of a dark color, slender, strong. Heads average two and three-quarters inches in length, six breasts averaging nearly three kernels. Grain white, medium size.

POLISH.—Slender straw. Hardy. Late. Three and a half inch heads; eight breasts, two grains. Chaff a light brown—kernels white, small.

DOTT.—Straw three and a half feet high, golden color, strong. Heads bearded, three and a half inches long, two and a half kernels to a breast—breasts widely separated. Grain amber, good size. Estimated yield over 20 bushels. Ripe July 12.

REMARK.—Silver Chaff Wheat was sent out by the Department of Agriculture several years ago. The seed seems to have been mixed with a bearded kind, not less than 50 specimens of which have been sent to us for identification. We would say that these specimens so closely resemble Dott that we should not hesitate to pronounce them the same.

SONORA.—(Spring) all killed. Spring Mediterranean, 50 per cent. killed. Sherman (Spring) 99 per cent. killed. Judkin (Spring) killed. Canada Club, land not well drained—killed. China Spring passed through the Winter admirably and promises to make a Winter wheat of some value for this climate. Prussian white, killed. Mold's white and red Winter wheats are too late for this climate. Some of the finest heads we have ever had sent to us, however, were of these varieties, raised by Isaac Alter of Lakeport, Cal. As stated last year, many of the spikelets contained five grains and three of the heads bore 102, 95 and 90 grains. We hope next year to speak more definitely as to some of the kinds of wheat which have originated here.

WHEAT NOTES.

SHUMAKER is as early as any of our 77 kinds of wheat. Each head averages seven spikelets and each spikelet averages two and one-eighth grains. It is a tall-growing wheat with rather slender straw and dark chaff. We learn it makes a very good quality of flour though not, perhaps, the best. Of all our wheats the Shumaker (sometimes Shoemaker) was the only one that lodged at all, and this only in one part. It yielded heavily and we should commend its trial to our readers.

MR. WYSOR once stated in this journal that out of a gill of grains of wheat planted four inches apart, not one was lost by winter-killing, while at least one-half of that sown broadcast on the field was so killed.

FROM a trial of Silver Chaff wheat made by 15 farmers, in Ohio chiefly, in 1880, the average yield was 26¼ bushels. Of Velvet Chaff, according to the reports of 11 farmers in Ills., Mo., Kan., Md., N. Y., Pa., Mich., Wis., and Ohio, the average yield was 26 bushels per acre. Arnold's Gold Medal, tried by 12 farmers, mostly in Ohio, yielded 21⅞ bushels. Sandomirka, tried by seven farmers, mostly in Ohio, yielded 24⅛ bushels. These trials were instituted by C. E. Thorne, the Farm Manager of the Ohio State University.

WE BELIEVE that the recommendation persistently urged several years ago to sow wheat late in order to escape the Hessian Fly, has cost the farmers of this country thousands of dollars.

WM. KLIPPART says that Velvet Chaff Wheat was abandoned in Franklin Co., Ky., years ago. It yielded, he says, 40 bushels per acre, but deteriorated, as it was liable to injury from insects, smut and rust. In other parts of the country, this wheat is particularly rust, smut and insect-proof. There are many kinds of Velvet Chaff wheat, however, some bearded, some beardless. The variety best known by that name is shown in another column and succeeds admirably in Ohio as well as at the Rural Farm.

IT IS pretty well known that pistillate strawberries, like the Manchester, are more prolific than those bearing perfect flowers having both stamens and anthers. Does it follow that beardless wheats should be more prolific than bearded wheats? The cases are not quite alike, since the beard is but a part of the palet while the stamens are the male generative organs and may be supposed in their growth and development to require a greater amount of nutriment.

FULTZ.—This ripens early (July 7 the past season); bears a straw of medium hight, which turns reddish before ripening. It is not very thick but strong and is seldom broken or lodged. The heads average rather small; the kernels are of only medium size; but they are close together upon the heads and the average number is greater than that in a head of Clawson. Hence it yields well. But there are scores of kinds, if they were but known, that would yield as well and yet make a flour far better in quality. Fultz is, as we judge from experiment, well adapted to low or ill-drained grounds, if this can be said of any wheat.

IN Japan, it is said, the wheat has been so developed by Japanese farmers, that no matter how much manure is used, the straw will not grow larger, though the length of the ear increases. The hight is rarely more than two feet, and often not more than twenty inches. We should much like to see some of this Japan wheat.

ISIS was supposed to have introduced wheat into Egypt, Demeter into Greece, and the Emperor Chin-Wong into China, about 3,000 B. C. In Europe it was cultivated before the period of history, as samples have been recovered from the lacustrine dwellings of Switzerland.

Crossing Wheats.

Crossing wheats is rather a delicate operation until one has gained dexterity by experience requiring both a steady hand and a deal of patience. The outer husk or covering of the flower is called a glume, see A, Fig. 442, Within this are two similar coverings called pales or palea, the first of which is awned in the bearded kinds and in the beardless kinds merely pointed. Between these two pales are the generative organs—the stamens and pistil, (1). In crossing different varieties the two pales must therefore be separated so the anthers, which bear the pollen or fertilizing dust, may be removed and other anthers inserted in their place—anthers from the kind with which it is desired to make a cross. The latter is called the male parent; while the flower receiving the anthers is called the female parent. After the stamens of the head to be fertilized have all been removed—which is easily effected by the use of a sharp-pointed stick, as shown in the engraving, Fig. 447—and other anthers introduced, it is best to wind a worsted yarn about the spikelets to hold the glumes and pales together and so exclude the possibility of the intrusion of pollen from the same or other spikes. Anthers should be selected of a golden color, just before the pollen has been shed, as when severed green they shrivel up and the pollen grains never mature. Or the dust may be collected by the aid of a camel's-hair brush (see Fig. 447), and applied to the stigmas. We prefer to use the anthers as the simpler method. Twenty-five different heads of wheat were crossed here during the past season. Of these three were destroyed by sparrows and the straws of two were broken so that the heads failed to ripen. Of the 20 heads remaining, 182 perfect grains—or an average of over nine grains to a head—were the results of the work. These we shall, of course, plant separately, cultivating the ground about them and giving them every care. As pollen from different kinds was often used upon the same head, only the pistillate parent is recorded.

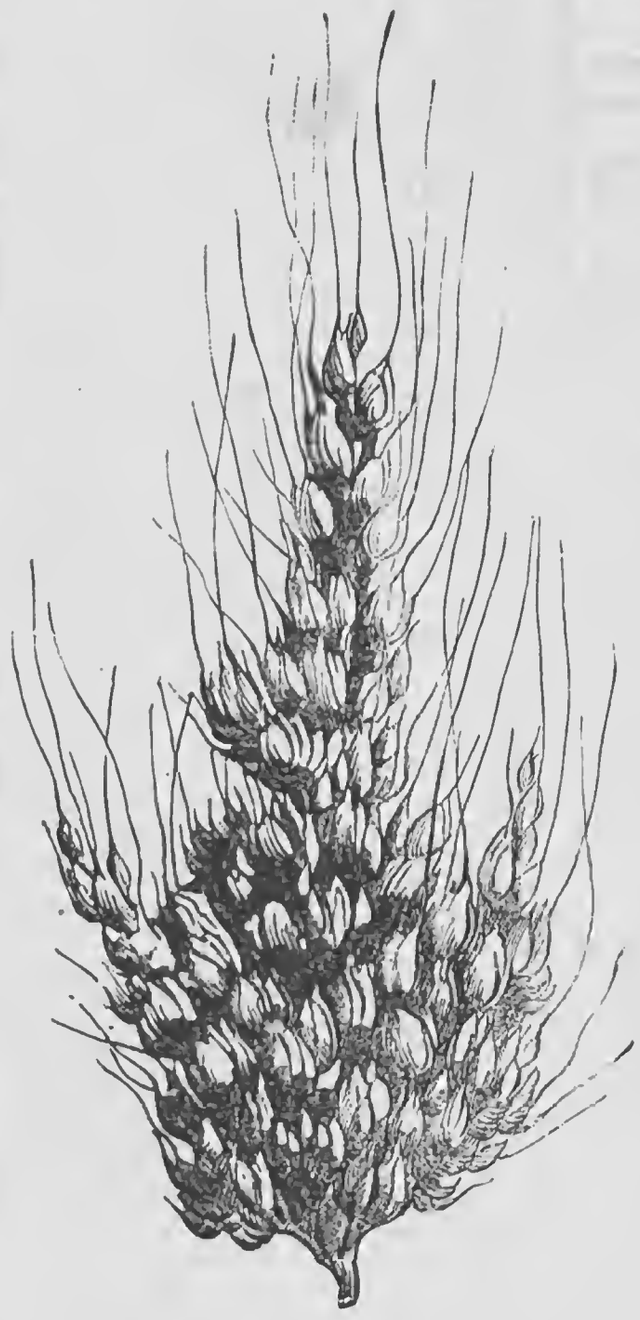
Egyptian Wheat.

This grows to the hight of three feet, bearing a bearded, compound head about four inches long. The secondary heads or spikes vary. Sometimes there are as many as 10—sometimes but two or three. It is simply a branching head the same as a half dozen secondary ears of corn sometimes grow from the main rachis or cob. The kernels are with us of an amber color and small, though the seed planted was white and of a good size. This change may be owing to the fact that this is the first time, we believe, that it has been cultivated in this climate as a Winter wheat. The weight of the head is so great that while ripening it is often bent over to the ground, sometimes breaking the straw. It does not seem worthy of cultivation except, it may be, as a curiosity. We have, however, used some of its pollen in crossing wheats during the past season. The engraving, Fig. 441, was sketched from one of our best heads, which ripened July 25.

Velvet Chaff Wheat.

This wheat orignated in Clinton County, Ohio, where, in 1857 or 1858, Mr. Abram Penquite, while cradling in a field of wheat, noticed three heads of a different variety from the rest of the field. These he saved and propagated, and from them has come the wheat now widely known in Southwestern Ohio as the Velvet Chaff.

The name of "Velvet" or "Velvet Chaff" has been applied to a number of different varieties of wheat. John H. Klippart, in his "Wheat Plant," describes four varieties, all



EGYPTIAN WAEAT.—FIG. 441.

different from the one under consideration which had been cultivated in Ohio previous to 1860, and some of which are still in cultivation. This variety is distinguished by extreme earliness in ripening; a straw of medium length and much stiffer than that of the Mediterranean; a heavily bearded head; a medium-sized, but very plump and heavy grain, of a dark amber color; and a peculiarly heavy brown chaff, which gives the variety its name.

I have caused this wheat to be tested over a considerable extent of country during the past two years, and it seems to be especially adapted to the black soils of the prairies. In an acquaintance of ten years I have never known it to be injuriously affected by either variety of smut. I have never been able to see that rust affected one variety more than another, except that late varieties were more liable to its attacks than early ones. The Ohio millers who are acquainted with both varieties, pronounce the Velvet Chaff equal to Mediterranean as a milling wheat, while farmers generally prefer the former on account of its superior earliness and stiffness of straw.

We are this year testing about 30 varieties, among them a wheat taken from the valley of the Theiss, in Hungary, to Minnesota, in the hope that it would rival the Scotch Fife, but it failed to germinate there. Velvet Chaff will be for sale at simply enough advance over market price to pay for extra handling, when the new crop comes in.

Ohio State University. C. E. THORNE.

MEDITERRANEAN WHEAT.--WHO SHALL IMPROVE IT?

J. S. WOODWARD.

Each year brings to the notice of the wheat-grower some new variety of wheat, highly extolled and sure to take the place of favorite; but as is usually the case, on trial some fatal defect is found and each year as many varieties are discarded as are added of new ones. A hundred different wheats might easily be named, that have thus been the favorite and again thrown by, since my farming experience begun. So far as my acquaintance extends, only one variety now in cultivation has stood the test of a single generation and is to-day as high in the esteem of both grower and miller as when first introduced. That variety is the Red-bearded Mediterranean.

When first introduced, it was coarse and dark; it made a strong healthful flour but very dark; about its only recommendation was its hardiness and earliness, enabling it to stand the Winter and to escape the ravages of the midge. Its introduction was, in fact, not a matter of choice but of necessity. We could grow a small crop of that and we could not grow any other variety then known; but each year it has grown better and better, both in quality and yield, and lighter-colored in grain and flour, until now it is the favorite of the miller and the baker, and they pay from five to seven cents more per bushel for it than for any other grown in this section. If a farmer has a plot of ground less adapted to wheat than another, he surely sows it to Mediterranean and often then secures his best results. About the only defect it has is its liability to lodge and its open, loose head; but, then, it will lodge and fill when another would not, and its loose head will stand more bad weather at harvest time than any other. This present season in Western New York it is the only variety that has entirely escaped the attacks of red rust on the leaves.

I fully believe that any man who will each year constantly sow Mediterranean on a quantity of land equal to that sown to any of the other or newer varieties, will at the end of ten years find the balance of account on the side of this old variety, I do not find fault with this constant desire for something better and more profitable. That is a characteristic of our people; but I do think a great mistake is made by our improvers of wheats, in that they do not take this old reliable stand-by as the variety from which to work up, and secure something that shall be better than any we now have and shall satisfy the wheat grower.

What we want in a wheat is all the hardiness, earliness and freedom from rust of the Mediterranean and, in addition, a closer head and a straw that shall be a little stiffer and less liable to lodge—Who will lead off in this new departure and secure so desirable and happy a result?

Niagara Co., N. Y.

CLEAN SEED.

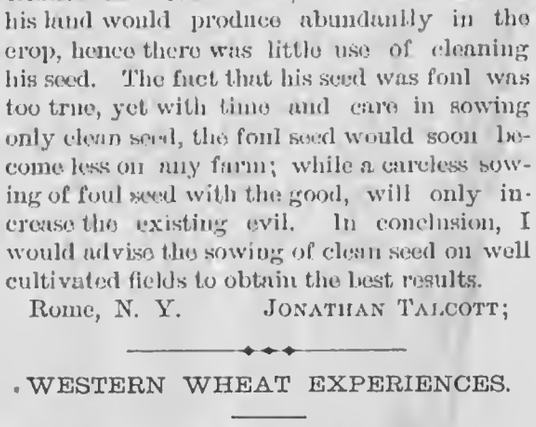
I wish to say, for the benefit of all tillers of the soil that shall read the Wheat Number of the RURAL, that more dollars can be gained by sowing only *clean seed* on well tilled lands than by all other methods combined. Most wheat growers would be surprised if the seed that is sown was thoroughly cleaned and they could see the foul seeds that are yearly sown even by good farmers. One of my neighbors, last year at seeding time, came to my barn to clean his seed wheat, as I had purchased a new mill for that purpose. He brought what he supposed was enough wheat to give him all he wanted when cleaned, and he also remarked that his wheat was very clean as it was. You can hardly imagine his surprise on cleaning the same to find that instead of a few pecks of worthless stuff he had bushels, and so surprised was he that he saved all the foul seed and shrunken wheat to show the farmer of whom he got the seed, who thought it quite clean—fully fit for seed without extra cleaning. The result was a crop of nearly 40 bushels of clean wheat per acre this harvest from six acres of wheat the seed for which had been well cleaned and the soil for which had been well prepared after oats and wheat grown on the ground in 1880. Another neighbor, also, whose seed I cleaned, had about the same amount of land sown and his crop is also nearly, or quite, 40 bushels per acre of clean wheat. Both these crops have been thrashed, so the results are known to be as stated, and both fields were the admiration of all farmers who saw them; yet how few farmers will take the trouble to clean their seed this Fall for the purpose of growing a clean crop next year. One farmer said to the writer, last Fall, that he knew his seed was foul, but his land was also full of foul seeds, and if he cleaned his seed wheat, the foul seed in his land would produce abundantly in the crop, hence there was little use of cleaning his seed. The fact that his seed was foul was too true, yet with time and care in sowing only clean seed, the foul seed would soon become less on any farm; while a careless sowing of foul seed with the good, will only increase the existing evil. In conclusion, I would advise the sowing of clean seed on well cultivated fields to obtain the best results.

Rome, N. Y. JONATHAN TALCOTT;

WESTERN WHEAT EXPERIENCES.

PROFESSOR E. M. SHELTON, KANSAS STATE AGRICULTURAL COLLEGE.

So long as the wheat plant continues to furnish the bread of civilized man, the condition of the crop at different seasons, and all means and methods looking toward its improvement, will be objects of interest to all classes of the community. Indeed, with no other farm crop can the farmer do more essential service to his country and kind, in following Dean Swift's famous advice to make two blades of grass to grow upon a spot of ground where only one grew before, than by furnishing practical methods for profitably increasing the "blades" and ears per acre of our wheat fields.



WHEAT SPIKELET OPEN. FIG. 442. WHEAT SPIKELET CLOSED. FIG. 443.

Nevertheless, I am not an advocate of wheat raising, as it is generally practiced in the West, upon a very large scale, and to the exclusion of all other crops. The exclusive wheat raiser, whether he be a "bonanza" farmer, or a poor homesteader who rakes and scrapes the last cent and ventures it on a wheat crop, is, according to my observation and experience, certain to bring to himself poverty of soil, purse, and spirit. The peculiar mental state of those farmers who grow wheat alone, is a study, albeit a depressing one. They are in an almost constant state of terror or exaltation over the rain or its absence, and scan the heavens like the Chaldeans. Drought, the fly, frost, chinch bugs, grasshoppers rust, hail—all of these terrors of the farmer seem to have a special spite against the wheat farmer. The place for the wheat crop—a position of profit and honor—is in alternation with grass and hoed crops. Here wheat is profitably grown without injury to the soil and with no unusual risks.

A Favorite Sort.

In Kansas, as elsewhere, many sorts of Winter wheat are grown, but those which are the most successful are not generally known, I think, east of the Mississippi outside of some of the Southern States. The weak point of our climate, so far as wheat raising is concerned, is the Spring season. The cold, wet weather which, from the Atlantic to the lakes, occupies so much of the season between the first of March and the middle of May, is all but unknown in Kansas. Our Winter is no sooner past than the Summer is upon us. Con-

sequently our wheat has but little time to tiller and strengthen its hold upon the soil. Almost from the day that the frosts have left the ground, the sun and elements ply whip and spur, driving it to the harvest by the middle of June. The result of these peculiar climatic conditions is that the coarse, slow-growing Eastern sorts, like the Clawson, Silver Chaff, Wicks, and others, as we have shown by repeated trials made on the college farm, are almost certain failures. A wheat to do well in Kansas, must be able to keep step with the season; it must be one of the small, red sorts, early, hardy, and of rapid growth. Such a sort we have in the Early Red May, a universal Western favorite. Other sorts have been found, like the Fultz and Lancaster, which in particular seasons gave a stronger growth of straw, and a larger yield of grain, and a still smaller number, like the Gold Medal, which gave a whiter and better flour than the Early May, but a comparison of this sort during a number of years with any other sort that I have yet seen, has invariably been to the advantage of the Early May.

The past Winter has, I suppose, dealt more severely with the wheat plant than any other Winter since the settlement of the State. It is interesting to notice in the published reports of the condition of the crop during the Spring, that, almost without exception, and from all parts of the State, the Early May was reported in the best condition, having sustained less injury than any other sort. Of twenty-four different sorts of wheat grown upon the college farm, under precisely similar circumstances as to soil and treatment, the old-fashioned Blue Stem alone appears in as good condition as the Early May.

Harrowing Wheat in the Spring.

The advantages of harrowing wheat in the Spring are frequently recited by the agricultural press, and the increased yield resulting I have seen placed all the way from five to ten bushels per acre. Still the practice is not a common one, although those farmers who once begin it rarely give it up, which is itself good evidence of the usefulness of the practice. In the Winter of 1879-80 I selected a portion of a wheat field, very uniform as to soil, situation, and the condition of the crop, and in this laid off six plats, exactly one-fourth of an acre each, with the object of testing the advantages, if any, of harrowing growing wheat. Each alternate plot, beginning with the first, was thoroughly harrowed on Feb. 26th; and on April 15th these plats were again harrowed and immediately afterwards rolled. The intervening plats, of course, received no special treatment. The results of this experiment may be seen in the subjoined table, in which the plats are given in the exact order in which they were placed in the field:

	Yield per Acre. Grain. bush.	Straw. lbs.
Plat A, Harrowed	15.13	17.60
" B, Unharrowed	11.83	11.64
" C, Harrowed	12.40	12.20
" D, Unharrowed	11.86	12.96
" E, Harrowed	16.13	16.72
" F, Unharrowed	14.58	18.28
Average yield of harrowed plats	15.21	15.50
" " unharrowed plats	13.76	14.29
Increased yield of harrowed plats	1.45	1.21

It will be observed that the yield of grain in every case, in the harrowed plats, exceeded the yield of the adjoining "unharrowed" plats, a fact which seems to show, pretty conclusively, that this increased yield was caused by the harrowing and by nothing else. It is true that this increased yield of less than one and one-half bushel of grain and one hundred and twenty-one pounds of straw in the harrowed plats, is not large, but it is enough to give good pay for the labor of running a light harrow twice and a roller once over the field, and at a season when farm labor is not particularly pressing.

How Much Wheat Shrinks in the Bin.

In the Fall of 1879 I prepared a long sack which was filled with exactly 200 lbs. of wheat, and sunk it deeply into a bin containing 150 bushels of Winter wheat. Here the sack remained exactly six months, when it was taken up and again weighed, this second weighing showing a slight fraction over 200⅛ lbs. as the weight of the sack of grain. This seemed to show that wheat does not shrink in the bin. I have just now finished a repetition of this experiment, giving almost precisely the same results as those detailed above. On November 13th, 1880, a similar long sack was sunk in a bin of grain, where it was allowed to remain until June 14th last, or exactly seven months and a day, when it was taken up and again weighed, this second weighing showing a full 201 lbs. of grain. I am not going to offer an explanation of this increased weight of a half pound in the one case and one pound in the other. This fact becomes all the more remarkable when we consider that our Kansas Winters are among the dryest seasons found anywhere. These experiments do seem to show that wheat does not shrink from evaporation in the bin when put up perfectly dry. The loss of weight from wintering over wheat, of which I have heard farmers complain, must then in justice be charged up to the rats and mice or the leaky condition of the granary.

WHEAT CULTURE AND EXPERIMENTS.

PROFESSOR I. P. ROBERTS.

About two-thirds of our experiments are thrashed and the results are given below. The land was stiff, poor, clay soil and has been under constant cultivation for nine years: one year in oats; in 1874 and 1879 it was summer-fallowed; during the remaining six years it has been in wheat. The field selected was about twice as long as wide, and the plats have run the long way of the field until the last year when they were changed to the short way.

BLACK-BEARDED CENTENNIAL — AVERAGE HEAD. — FROM LIFE.—FIG. 344.

The season has been far from good. Cold dry winds in April did much damage, especially where the fields were exposed to their full force. Those fields protected by hills or timber belts suffered least; but many of those that came safely through the Spring suffered to the extent of from five to ten bushels' loss per acre on account of high winds and heavy rains in June. The grain is badly shrunken in the lodged places, but plump and fine where it stood up.

Seneca, one of the great wheat counties of this State, will not have above half an average yield. The ground there was badly run together this Spring, caused by its being fitted when too dry, the soil becoming a bed of dust which ran together like mortar with the first heavy rain.

Cayuga County will have three-fourths as much, and Tompkins—not a good wheat county naturally—at least seven-eighths as much as usual. We have thrashed about one-third of our crop (360 bushels) and the yield, not including the experimental field, is between 37 and 38 bushels per acre, which is far better than we expected, as it was badly lodged.

PLOTS ONE-TENTH OF AN ACRE.

No. of plots.	Experiments in wheat 1880 & 1881.	Yield per acre in bushels. bush.	lbs.

19	2 " " No manure for six years	15	20

RESULTS.

The results of plots 5, 6, 7, and 8 I do not consider reliable, as the greater part of each was flooded for a short time and some plant food from the adjoining fields was evidently deposited and the yield increased thereby. Drilled seeding has given two bushels and twenty-five pounds per acre as an average of the last five years over broadcast sowing. This year it gives forty pounds less. The explanation above, I think, fully accounts for this.

SUMMARY 1881.

	bush.	lbs.
Manured plot	29	5
Average of all phosphated plots except 6 and 8	24	41¼
Unfertilized plots except 7	19	37½
Salted	22	25
From the above it would appear that the normal yield of this land was	19	37½
600lbs salt produced an increase of	2	47½
Phosphates " "	5	35
Farm manures " "	9	27½
Sixth continuous crop without fertilizers.		
Season moderately fair, 1881	15	30
" " 1880	31	00
" " 1879	31	51
" superior, 1877	34	42
" fair 1876	18	27
" poor, 1875	7	51
Average for six years	23	14

The object of this experiment has been to prove the great value of the thorough preparation of the soil. But the full value of the experiments can be appreciated only by those who have seen the unpromising condition of the ground upon which they have been conducted.

AVERAGE OF SIX YEARS' THICK AND THIN SEEDING.

	bush.	lbs.
3 bushels per acre	25	4 5-6
2 " "	23	30
4 years, 1½ bush. per acre; 2 years, 1½ bush.	23	¼
Comparison of all phosphated plots with a like number of adjoining unfertilized ones for six years:		
Phosphated	32	22
Unfertilized	27	52 4-9
Comparison of salted with unsalted plots for three years:		
Salted	26	28⅓
Unsalted	22	58⅓
Comparison for three years:		
F. Y. manures, 14 loads, about 5 cords	33	33⅓
Unfertilized	20	55

The prices realized for this wheat were as follows: $1.75, $1.06, $1.15, average $1.32; 12 bush. 38⅓ lbs., the extra yield over the unmanured plots, brought $16.68. Fourteen loads of manure (small ones, as the hill is very heavy out of Ithaca) cost $10.50 spread on the field. In several instances the good effect of the manure was quite as conspicious the second year as the first. Our experience and all experiments, both in this country and Europe, show the lasting effect of farmyard manures.

I speak from careful observation and estimates, when I say I believe that over half of the farmyard manure of the United States is wantonly and uselessly wasted; frequently, too, by those who have to purchase phosphates at $30 to $40 per ton to supplement the contents of "Drychaff's dung cart, that creaking hearse that carries to the field the dead body whose spirit has departed."

Tests of varieties: Plots one-twelfth of an acre, land gravelly; had been in Orchard Grass for the two preceding years. Plowed once in July and top-dressed with F. Y. manure and 150lbs. of phosphates per acre drilled in with the wheat.

	yield per acre. bush.	lbs.
Fultz	37	35
Clawson	39	25
South Wales from Agricultural Dep't. D. C.		Failure
Gold Medal	41	26

On the further end of the same field on poor land the following experiments were tried with the Clawson wheat:

	bush.	lbs.
F. Y. manures about 5 cords per acre	22	49¼
F. Y. manures as above, and 150lbs of phosphates	22	00

I would be pleased to receive one-half bushel of any variety of wheat not named in the above experiment, for the purpose of testing its productiveness. If the seed sent is really clean and the shrunken grains have been screened out, one-quarter of a bushel would be sufficient. If senders of samples desire, I will pay for the sack, and a reasonable price for the wheat.

Cornell University, Ithaca, N. Y.

IN THE WHEAT FIELD.

HUGH L. WYSOR.

Bald and Bearded Wheats.

What is the advantage or disadvantage of bearded over beardless varieties of wheat in growing, thrashing and milling? Ought the beardless to yield more than the bearded?—are questions which the Rural has suggested for me to answer. In making a comparison, it must be understood that these remarks apply almost exclusively—so far as bearded varieties are concerned—to those of the Mediterranean type. Note here that the Swamp Wheat, distributed several years ago by the Department of Agriculture and occasionally mentioned in the Rural crop reports, possesses no characteristics to distinguish it from the Mediterranean. They are practically the same. There are other bearded wheats which have a merely local reputation, and are not generally known. Of such is the Jennings, a bearded white flint with a stiff straw.

What, then, are the advantages of bearded wheats? They are hardier, tiller more, and grow on thinner and more exposed soils than the bald. They are seldom attacked by mildew, and if they are so, are never very seriously injured. If they are laid or lodged by storms or other causes, the ears are measurably well filled, which is not the case with the bald kinds. If we leave out the bald white flints, the bearded excel in making a rich yellow flour, which, while not as white, commands fully as high a price in the markets as that made from the bald white flint sorts. In confirmation of this, it may be stated that our Richmond millers pay from 10 to 15 cents more per bushel for the Longberry than they do for Fultz, which is, as they term it, too soft; that is, contains too large a percentage of starch. Finally, I do not remember ever having seen smut in bearded wheats. I have seen fields of Fultz so full of smut that it could be smelt at a distance of 50 yards from the field.

What are the objections to bearded wheats? Their straw is too soft; they are therefore not suited to rich or alluvial soils, on which they frequently lodge or fall flat. The beards, too, retaining water after a rainfall, the straw bends beneath the increased weight, and is laid by the wind. Further, after the wheat is dried in the shock, the chaff falls away from and partly exposes the grain, which wastes considerably in hauling to the stack or barn. [This seems to us a weighty objection.—Eds.] Lastly, the beards make the wheat very disagreeable to handle both in harvesting and in thrashing. In some mysterious way they creep through the clothes and keep the skin in a constant state of irritation, particularly if the weather is hot. They are also probably not the best things in the world to be fed to cattle in the straw.

In answer to the question, "Ought bald to yield more than bearded kinds?" it may be said that, as a matter-of-fact, they do because the latter seldom exhibit more than two kernels to the spikelet. This deficiency, however, is in part made up by the large size of the grain. Still there is no assignable reason why a bearded wheat may not be produced which shall equal in productive capacity any of the bald sorts. I have sent the Rural a new bearded wheat, the origin of which is unknown to me, which shows four, and, in a case or two, five grains to the spikelet.

Smut in Wheat.

Some weeks ago a correspondent of the Rural inquired the cause of black heads appearing in wheat. The answer supposed that he had reference to smut ears, but he probably alluded to the blasted ears which frequently, and sometimes in great numbers, appear in bald wheats. They are more correctly not ears at all, for there is nothing on top of the culm but the blackened rachis without any spikelets. These black heads do not injure the remainder of the wheat in any way whatever. Smut, on the contrary, exhibits nothing to the inexperienced eye to distinguish it from ears of good wheat. In fact, it attracts attention by its unusually bold and flaring appearance. The observer has only to apply an ear of this sort to his nose to satisfy himself of its nature. The kernels of smut are at first green like those of wheat, and turn black when matured. An ear of wheat will sometimes contain both kernels of smut and of sound wheat.

There seems to be no better established fact than that smut is a fungus which grows upon and destroys the grains of wheat which it has attacked, yet I have recently met an intelligent farmer of this county who attri-

butes it to a very small insect which perforates the chaff somewhat in the manner of the pea beetle and deposits an egg. In confirmation of this, he says that if an ear of smut be closely examined while green, a small puncture will be found going through the chaff opposite every kernel. He further states that if smutted wheat be left in the stack for a year or two, when it is opened no whole grains or ears of smut will be found, but there will be a great deal of dust and scales made by the insects in escaping. It may be objected to this theory that it is asserted that wheat is frequently destroyed by this fungus before the ears have appeared from the sheath.

Three Essentials in Wheat Growing.

A successful wheat grower of this section claims that the three things necessary to be done in growing a good crop of wheat are: to sow early; to fertilize liberally; and to pasture closely. I should omit the last, but subscribe to the other two. Yet he contends that the last is absolutely essential, and accordingly acts up to his theory by grazing his wheat off with sheep. His average yield per acre for some years past has been from 20 to 25 bushels. I cannot help believing that his yield would be greater if the grazing were omitted, for it must make the wheat later in ripening, and the tramping done to the land in wet weather is assuredly not beneficial to the crop. I have never observed the effects of grazing except on small patches on which fowls were running during the Winter. In these cases, the plants bloomed ten days later than the rest of the field and never matured their grain at all.

Pulaski Co., Va.

VARIETIES OF WHEAT.

An Experiment Made on the Farm of the Ohio State University.

THIRTY-THREE varieties of wheat were sown in the Fall of 1880 upon a piece of bottom land selected for its apparently uniform quality. The previous crop was Timothy, and the field was plowed in September. On account of the excessive drought, sowing was delayed until October 4th to 6th, but even then the seed lay in the ground until much of it had malted before there came rain enough to start it into vigorous growth. On this account the experiment may not be as reliable as could be wished with regard to the comparative productiveness of the different varieties, although it is believed that all of them were equally exposed to the unfavorable conditions. Other questions—as to comparative weight of grain, quality of grain and straw, etc.—of course were not affected.

One of the varieties, the "Black-bearded, Centennial" proves a total failure, not being adapted to the climate. After harvest samples of each variety were sent to Warder & Barnett, merchant millers, of Springfield, O., with the request that they test the same with reference to their value for milling purposes. This they have kindly done, and their report is given in the following table, together with the agricultural results of the experiment:—

NAME OF VARIETY.	Date of ripening	Yield per acre. Grain, bush.	Straw, lbs.	Pounds straw to 1 bush wheat.	Pounds of grain per bush.	Weight of grain per bush.	Smooth or Bearded.	Character of grain. Color.	Size.	Milling quality.	Character of Straw. Hight, feet.	Stiffness
1. Siberian	July 12	11.69	2,655	180	57		S	A	s	Poor and weak.	3¾	Good.

EXPLANATION.—A, amber; R, red; W, white; B, bearded; S, smooth; s, small; m, medium; l, large.

* NOTE.—The extremely small proportion of straw to grain in Helge's Prolific may seem improbable; but a still smaller proportion is reported in the tests of the Missouri Agricultural College for 1880.

The average yield and weight of grain of the varieties ripening on successive days are as follows:—

	Av. yield, bushels.	Wt. of grain, pounds.
July 2	21.05	61¾
" 3-4	24.02	60⅝
" 5	23.48	60¾
" 6	22.29	59½
" 7	20.68	59½
" 8-12	15.62	57½

The average yield and weight of grain of the red and amber, as compared with the white wheats, are as follows:—

	Av. yield, bushels.	Wt. of grain, pounds.
Red and amber	21.61	60¾
White	20.80	60

The average yield and weight of grain of the smooth wheats, as compared with the bearded wheats, are as follows:—

	Av. yield, bushels.	Wt. of grain, pounds.
Smooth	20.28	59¾
Bearded	22.56	60¾

In regard to the last two points Warder & Barnett write as follows:—"White wheats are not usually as hardy as red, and smooth are not nearly as hardy as bearded. In an experience of 36 years we have never known a smooth wheat which would stand more than three crops." Our figures point toward the same conclusion, and it would seem worth while to examine this matter further.

Columbus, Ohio. C. E. THORNE.

SELECTING SEED WHEAT AND OTHER GRAINS.

PROFESSOR W. W. TRACY.

THE general history of new varieties of grain has been about as follows. Some one finds a single plant produced by accident, which in certain desirable qualities (generally those of productiveness and hardiness) exceeds the varieties he is familiar with. He carefully saves and plants the grain in carefully prepared soil and, anxious to make the most of his seed, sows it so thin that each plant has a chance to perfectly develop and mature all the grain possible. As the stock increases, it is distributed over the country and the seed, being rare and costly, every one gives it an equally good chance, and the new sort is reputed to exceed any of the old sorts in productiveness. In a few years the seed becomes abundant and is sown like the older varieties and then speedily loses its good reputation and is abandoned for some newer sort.

Let us look for the reason and the remedy for this. No one can go through his wheat field without noticing that each *individual plant* produces, even in a maximum crop, far less grain than the plant would be capable of if it were in the most favorable condition for its most perfect development, and it cannot be otherwise than that the continual using of such plants for seeds must tend to reduce the productiveness of the stock. But let us look farther. If we examine the ripening grains, we will find that many of the plants have been so crowded that they have produced but single short heads; but examine these heads and in many cases you will find they contain but a very few grains, although frequently these few are exceptionally large and fine. So often is this the case, that let anyone attempt to select a few of the largest grains from a given field and he will find he obtains the majority of them from small or poorly filled heads. Much has been written on the desirability of carefully selecting seed grain, but it is usually accompanied with directions for selecting the largest and plumpest kernels, a course which, I think, will surely result in giving seed grain largely obtained from poorly developed plants. Is it any wonder, then, that even the most careful farmers are continually complaining that the wheat which formerly gave them a good yield has to be abandoned because it has become unproductive?

Is there any remedy? I think there is and a very simple one—namely, select your seed grain, as all other choice seed is selected, for the qualities of the plant rather than those of the individual seed. Is it practical to do this? I think so, and in this way: Let each farmer, before cutting his wheat, go into the field and select enough of the best plants—those producing the greatest number of large and well-filled heads—to give him about one quart of seed for each 15 or 20 acres he is to plant; let him thrash and save this seed by itself and sow it across one end or side of his field. On a large farm he can do this accurately enough for practical purposes by putting it into the drill first and carefully leveling it before emptying in the general seed, when the man may be set to work as usual. The next season, just before cutting, let him go into the part of the field where this choice seed was planted, and select a corresponding number of the best plants for the next season's seed stock, and cut and save the remainder of this part of the field to use for general seed that year. He can easily do this by simply cutting and stooking it first and hauling it into the barn last. In this way I think every farmer might not only maintain, but increase the productiveness of the variety best suited to his wants, and not be obliged to send off every few years for some new and better yielding sort.

RURAL WINTER HARD FIFE.—FIG. 446.

IMPROVING WHEAT.

PROFESSOR W. J. BEAL.

ONE new variety after another comes into prominence, and is extensively raised for a few years. It dwindles and disappears, to be followed by others. This occurs in the best wheat regions of the United States. Is this deterioration necessary? Can it be easily prevented? You asked for something about wheat. I can do little better than call attention to lectures or articles of mine in the past volumes of the Michigan Board of Agriculture. But few copies were printed, and although they have been sent to the editors of agricultural papers, they are seldom quoted.

Of course, the experiments of Frederic F. Hallett, of England, who began by selecting the best head of wheat he could find, paying especial attention to quality, are worth quoting:

Length.	Grains.	No. Ears on Finest Stool
1857, original ear, 4⅜ inches	47	
1858, finest " 6¼ "	49	10
1859, " " 7¾ "	91	22
1860, ears imperfect from wet season		39
1861, finest ear, 8¾ inches	123	52

"Thus," says Mr. Hallett, "by means of repeated selection alone in this short time the length of the ears has been doubled, their *contents* nearly trebled, and the 'tillering' power of the seed increased five-fold." This remarkable change was brought about in the following manner: These seeds were planted, one in a place, nine by nine inches. *The plants were well cultivated.* From seed raised in this way a whole field of ten acres, in a very unfavorable year, yielded 57 bushels to the acre, while with ordinary seeds on previous years the same land yielded from 22 to 40 bushels to the acre. The heads became more uniformly of good size and good quality, and yielded well. Like a well-bred flock of sheep, where the owner had bred toward one standard, they were even and uniformly good.

Here is another idea which is worthy of attention. It is from the Hon. George Geddes, one of the noblemen of the great State of New York: "At or before the time of thrashing set some sheaves on a floor, heads upward, and then draw out the most perfect heads—those of the greatest length and the best filled. Put this selected seed on land in the best condition in every respect; weed the wheat the next Spring. Out of this again, the next year, draw the best heads, and so on for several years—the longer the better. By-and-by whoever does this will have some seed wheat to sell that he may be willing to have bear his name, and he will be a public benefactor."

By this means he will get seed wheat which has had good ancestors for a series of years. Many of our farmers are quite particular to sow good, clean seed wheat, and probably all would prefer such. How are the plump kernels selected? By means of the screens in the fanning-mill the kernels are separated. They come from all sorts of heads, long or short, *large or small*, from those stools producing a few small heads, or from those producing many large ones. The seeds are selected at random from anything that may happen to produce large kernels. In this common practice no attention is paid to pedigree. This plan is good so far as it goes, but it does not go far enough.

Men are numerous in every State of our great country who use better judgment in breeding their animals. We need more men who will patiently, persistently and intelligently give attention to breeding good sorts of grains, fruits and vegetables. There is as great a chance for improvement in one case as in the other.

[Our readers are aware that for two years past, at the Rural Farm we have carefully selected the seed used. The best, heaviest heads of each kind are selected, rubbed out by hand, and sown in small plots in the Fall.—EDS.]

SOME EXPERIMENTS WITH WHEAT.

WALDO F. BROWN.

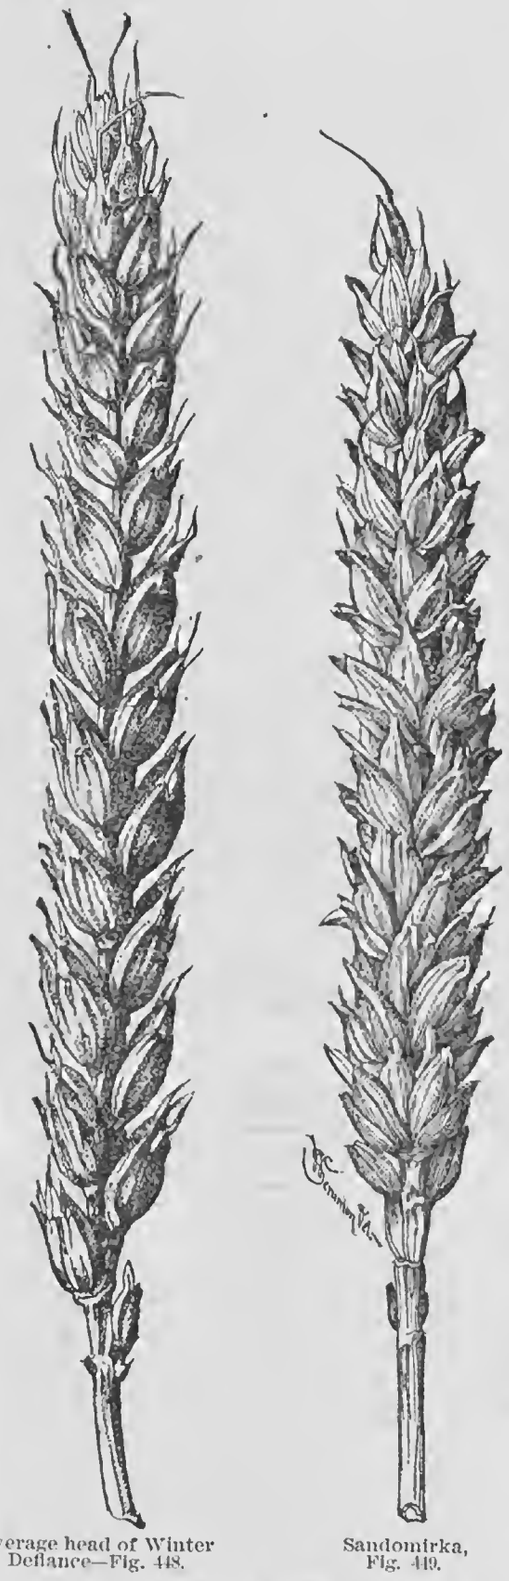
IN the Fall of 1878 I put in two acres of wheat and sowed one bushel of seed on one acre, and one-half bushel on the other. It was sown September 8, and when it first came up there was a marked difference between the two strips. But the Fall was favorable for growth, and before Winter it was difficult to tell which was the thin-seeded part. A neighbor cut it for me, and I told him that one side was seeded with half a bushel and the other with a bushel, and asked him to pay particular attention and see if he could tell which was the heaviest, but he could detect no difference. We had 103 shocks, 51 on one acre, and 52 on the other, and the yield was 35 bushels per acre. The next year I added four acres to the piece and seeded it with three pecks of seed to the acre. The yield was 180 bushels, or 30 bushels per acre. I have grown on picked acres over 40 bushels of wheat from three pecks of seed.

FIG. 447.

In the Fall of 1878 I manured a strip of thin land with bone meal at the rate of about 300 pounds per acre, and left a space one rod wide through the center to test the difference. As soon as the wheat started to grow in the Spring, that on which the bone was used out-grew the other, so that it could be seen from a distance in passing the field, and at harvest the unmanured strip was not worth cutting, while the part "boned," made 15 bushels of excellent wheat to the acre.

In the Fall of 1879 I sowed four acres of wheat on corn land. It was a cold clay, and I had rarely grown a paying crop on it, the corn that year did not make 20 bushels to the acre. I divided it into four equal strips and manured the first with one barrel of sifted hen manure; the second with 12 loads of stable manure; the third with 200 pounds of ground bone

and the fourth with 200 pounds of superphosphate. I left strips 10 feet wide without any manure between the different plots. From a comparison of the unmanured strips I estimate that I doubled the crop by the fertilizers. The four acres yielded 120 bushels, and although I did not thrash the strips separately, I found that the barrel of hen manure made as heavy a crop as the 12 loads of stable manure. Possibly it supplied just what was needed in the soil or gave the wheat just the quick start needed to enable it to find material already there. If a barrel of hen manure, as the experiment indicates, will add 10 or 15 bushels of wheat to the acre, it is time farmers were finding it out.



Average head of Winter Defiance—Fig. 448. Sandomirka, Fig. 449.

I am much in favor of top-dressing wheat land, and from experiments extending over several years, I find one load of manure made fine and spread on the surface, is worth to the wheat crop two plowed under. If used in this way every half cord of manure will make an extra bushel of wheat—and under favorable circumstances it will often double this. I believe that manure from a shed where it has been allowed to accumulate and retain all the liquid, is worth two or three times as much for wheat as that from the barnyard, and I am so situated this year that I can test the matter, as I have several loads of manure in a stable where I have kept a mare and colt all Summer.

I wish every wheat grower who reads the RURAL would try some experiments with this crop. I will suggest a few: 1st. Try one dollar's worth of extra work on an acre in the way of pulverization, and see if it does not give several dollars' worth extra of wheat; 2nd., see if three-quarters of a bushel of seed properly put in will not give a full crop—as much as 1½ bushel; 3rd., try a half cord of manure well "fined" on a tenth of an acre as a top-dressing, and see if it does not give from one to two bushels more wheat than an adjoining plot of the same size unmanured; 4th., try at least a small plot or two with some special manure, such as bone meal, night soil, hen manure, etc., to enable you to determine whether you can use them profitably or not. All such experiments will be of great benefit to you, and will be likely to make you more careful in the future.

Butler Co., Ohio.

SALT ON WHEAT.

PROFESSOR G. C. CALDWELL.

Whether or not to apply salt to wheat, and when to apply it, and how much to apply, and why it is useful, are oft-repeated questions in the agricultural papers. There does not appear, at first thought, to be any good reason why salt should be good for wheat; and yet no one can put together all the testimony about the matter, without being convinced that it does sometimes pay to use it for this crop. One farmer who, on a soil that was too light, hot and dry, got poor crops of Spring wheat, with a top-dressing of three bushels of salt harvested 25 bushels from the same soil, and with four bushels of salt harvested 29 bushels. Another can get fair crops of Winter wheat without salt on the same soil that for Spring wheat requires a liberal dressing of salt, as he thinks, to hold the moisture in time of drought. We are told that so careful and successful a farmer as the late John Johnstou was accustomed to set great value on salt for wheat, for earlier ripening and stronger straw. Again, we find it stated that a bushel of salt is good for an increase of four bushels of grain. A Wisconsin Farmers' Club arrived at the conclusion based, it is to be presumed, on the experience of its members, that salt hastens the maturity of the grain, increases the yield 25 or 30 per cent, stiffens the straw, prevents rust and smut, and at least checks the ravages of the chinch bug—a good deal to claim for salt. A Pennsylvania farmer with refuse salt from the packing houses gets 24 to 30 bushels of wheat to the acre on a soil which without salt would not yield a crop worth cutting.

Voelcker speaks of the use of salt as frequent in England as a top-dressing for Spring wheat, mixed with an equal quantity of nitrate of soda, or Chili saltpeter. Bretschneider in Germany found that with nitrate of soda, which used alone gave but little increase of crop, the use of salt might pay, as it gave an increase of 18 per cent. of grain, but used with sulphate of ammonia it gave only ten per cent. increase over the ammonia compound used alone, and with guano it gave no increase over guano alone, except in regard to the straw. Many results of trials of salt on wheat are given in the Journal of the Royal Agricultual Society. Haunan in 1844 found only a slight tendency to increase the yield and weight per bushel. In a prize essay on cropping light land, written in 1853, the use of salt at the rate of two to four cwt. per acre is spoken of as increasing in favor, as it stiffens the straw, and assists in filling out the ear; and it is claimed by one writer, who had used it for many years, that it gives a better result with wheat than with oats or barley—in which respect, however, other writers do not agree with him.

Mr. Lawes in 1864, after mentioning the widely extended use of salt in the British Isles, and expressing doubt as to the reliability of some of the experiments with salt on wheat that had yielded remarkable results, shows that on his own estate it does no good. In the discussion which followed the reading of his paper, some were disposed to insist upon the value of salt, at least on some soils and especially on light lands; and an instance was given where a salted field of four acres yielded 30 bushels per acre of good grain, while on the adjourning unsalted field only 20 bushels of poorer grain were obtained. The straw of the stiffer, salted wheat, that stood upright was found to contain eighty-three per cent. of silica, while that of the unsalted field which was badly lodged, contained but 75 per cent. of silica. This may, however, have had nothing to do with the strength or weakness of the stalk, since experiments have shown that stalks with but traces of silica may be as strong as those containing the usual large proportion.

Against all these favorable results obtained by the application of salt to wheat it would be easy to produce an equal number of unfavorable ones, and probably successes are more likely to be made public than failures. In France, a commission appointed to inquire into the subject reported that salt was of no use as a fertilizer, at least when used alone. Failures to obtain good results seem to be more common on heavy soils than on light lands. On the whole, while the evidence of really accurate experiments on either kind of soil is far from what is needed to establish any conclusion in regard to the matter, as the case stands there is some evident ground for the belief in the usefulness of salt which prevails in some quarters.

Why may salt be useful on wheat? Certainly not because either of its constituents, chlorine or sodium, is required in the food of the plant; that there is no such need, at least beyond what may be supplied by any soil capable of bearing wheat at all, has been fully established. By many farmers salt is believed to be specially useful in times of drought; but it possesses no property, physical or chemical, which enables it to supply water to the crops. It may, however, if present in sufficient quantity, serve practically the same purpose in virtue of its power, when in solution in the sap of plants, of checking the rapidity with which water is transpired through the plant from the soil to the atmosphere; thus in times when water is scarce a given quantity in the soil may, by means of a sufficiently large dose of salt, be made to last longer and go further than it otherwise would. Salt in solution in the soil water may confer on that water an increase of solvent power for substances really needed by the plant, such as potash, lime, magnesia and phosphoric acid, as has been proved by numerous experiments. Salt may also, with the cooperation of the carbonate of lime in the soil, serve to increase the amount of nitrogen in the really valuable form of nitrate at the disposal of the crop. It is also affirmed by Voelcker that salt prolongs the vegetative period, and thus by keeping the crop for a longer period in a growing condition and causing it to feed on the soil for a longer time it may cause the production of a larger crop. I believe that in this capacity of providing in one way or another a larger supply of food for the crop out of the stores of difficultly assimilable material in the soil, the most satisfactory explanation of the effect of salt is to be found where any effect at all is produced. On a poor soil, scantily provided with plant food, it will therefore do no good, as there is no material for it to act upon to increase the quantity of food accessible to the plant.

Shall we use salt on wheat, and if we shall, when and how shall we apply it? The evidence does not justify a very decisive answer to the first question. But where salt can be had cheaply it will be worth while to try it on moderately light soils and Spring wheat. An application of from three to five bushels per acre will cost little, and may yield a fair if not a handsome profit. It is not best to apply it with the seed, but either three or four weeks before or after seeding. If only a small part of the readers of the RURAL would try the experiment this year, and for two or three years following, and report the result, together with a careful statement of the character of the season and of the soil, we might have a satisfactory solution of this as yet unanswered question, whether the use of salt on wheat is generally profitable.

A BUSHEL FROM EVERY POUND.

One Pound vs. Three to Five.

PROFESSOR A. E. BLOUNT.

THAT a bushel of wheat, on an average all over the country, should be produced from every pound sown ought to be *a fact*, and not an expression in so many words. That a bushel can be raised from every pound of wheat sown under all ordinary circumstances is a fact that farmers should verify every season. So long as they sow 90 to 120 pounds per acre, generally on poor land or on land poorly prepared, there will always be small crops and poor seed. When it takes three to five pounds of seed to raise a bushel, it is, to say the least, a ruinous waste. Enough is wasted in such seeding to supply with bread the whole wheat-producing population the year round; and not only is this direct loss sustained, but another—viz., thick seeding invariably hinders the wheat plant from producing as much as it would were it not cramped and crowded so closely by its sapping neighbors. Farmers mistake the demands of almost all small grain. Generally they think the more seed, the larger yield, when the very reverse is the case. There are seeds that send up but one stalk and require to be sown thick; there are others, like some of the grasses, that do better on sod thickly matted; but wheat, oats, rye and barley show very clearly their repugnance to being sown too thick by their failure to stool out and make many stalks from one grain. When sown broadcast or with a drill, 30 pounds of good seed per acre should be the *maximum all over the country* upon all land that is in any way adapted to its growth.

Many farmers have made extensive experiments in thin sowing, and in no single case where the conditions were favorable and the culture carried out on scientific principles, has there been a failure to produce from 50 to 6000-fold. Well authenticated reports are on record when 40, 30, 15 and even seven and a half pounds sown per acre have produced three, four and even six times as much as any 90 pounds ever did. Every good kernel should make at least 20 good heads and every head at least 40 grains—800-fold. This shows the nature and habits of the wheat plant. I have known one kernel to produce 181 good heads and these turned out on an average 37 kernels each or 6,697 kernels in all. In this county last year 76 kernels of my Hybrid No. 10 (weighing 51 grains, Troy) planted on 76 square feet and cultivated, produced 10¼ pounds avoidupois—nearly 1,400-fold.

On these grounds in small plots well cultivated last year no one of the 67 varieties sown produced less than 56-fold, all without any fertilizer whatever. Then in all the reported experiments that have been made in sowing wheat thin on large as well as small tracts, it has paid twice as much as the extra labor cost.

Agricultural College, Fort Collins, Col.

WHEAT YEARS AGO—SUCCESSES NOW.

COL. F. D. CURTIS.

Thirty-five years ago Eastern farmers generally raised their own breadstuffs. About that time weevils began to increase to such an extent that many farmers gave up raising wheat. We recollect seeing the screen-box nearly full of weevils after cleaning wheat in the fanning-mill. The larvæ fed upon the kernels when in the milk, and if they did not entirely destroy the head they made the grains shrunken and poor. The final stroke to wheat growing, was made by the importation of the Hessian fly which, like the chinch bugs now troubling the Northwest, fed upon the stalk near the root, sucking out its juices, causing it to wither and die. Late sowing, after the flies had deposited their eggs on other plants, helped to prolong the cultivation of wheat for a few years, but the crop was so risky that farmers generally gave it up. With no wheat to feed upon, these pests became exterminated. For nearly a quarter of a century a wheat crop was a rarity. Those were days when rye-bread was fashionable.

Mediterranean Wheat being imported (we believe by the Patent Office at Washington) was gradually disseminated, and although at first it was not much better than rye, it grew in favor, as it made better flour, and on account of its coarse chaff was not attacked by weevils. It was hardy and productive and year by year improved in quality. This variety of wheat doing so well, encouraged farmers to begin wheat raising once more, and now wheat crops in the East are common and

farmers are rapidly getting back to the old practice of raising their own bread. Clawson is the universal variety which, like the old Mediterranean, is hardy and productive but of poor quality as compared with other kinds now grown. It does not seem to improve by continuous growing. When the flour is mixed with that of harder varieties, the bread is more palatable, and the flour also improves with age.

Wheat is such an important crop in domestic economy and fits so nicely in the rotation of crops that "Wheat Numbers" and the discussion of wheat raising are always interesting and must be profitable. Many farmers are deterred from putting in wheat for the want of manure in the Autumn. Experience has taught that a good crop can hardly be hoped for without it. We have succeeded in having an excellent yield by sowing it in good season and drawing the manure upon the field in the Winter and spreading it upon the snow. In the Spring all the lumps were carefully knocked to pieces and scattered evenly over the ground. The after-manuring serves the purpose of protecting the plants during the Spring thawing and freezing better than if it had been harrowed in with the wheat when it was sown. The manure was that which was made during the Winter and was drawn directly from the stables to the field.

The seeding of clover and Timothy sown in the early Spring on this ground was the best we ever had. We like the plan of turning over a clover sod or an old meadow as soon as possible after it has been mown, for wheat. Our forefathers used to think they could not raise wheat without summer-fallowing. They plowed the land early in the Spring, kept the sheep on it to keep the grass and weeds down, and then plowed it two or three times more. Our plan is a kind of semi-summer-fallowing with the advantage of an extra crop. A few days after the ground has been plowed it should be thoroughly harrowed to fill up the spaces between the furrows and to prevent the grass from growing. By the first of September it should be cultivated and the soil pulverized, and by the middle of September cross-plowed. By this time the sods will be rotten and the land can be reduced to a fine tilth and mellowness which fit it for wheat. Wheat should never be harrowed in, but covered either with a drill or cultivator.

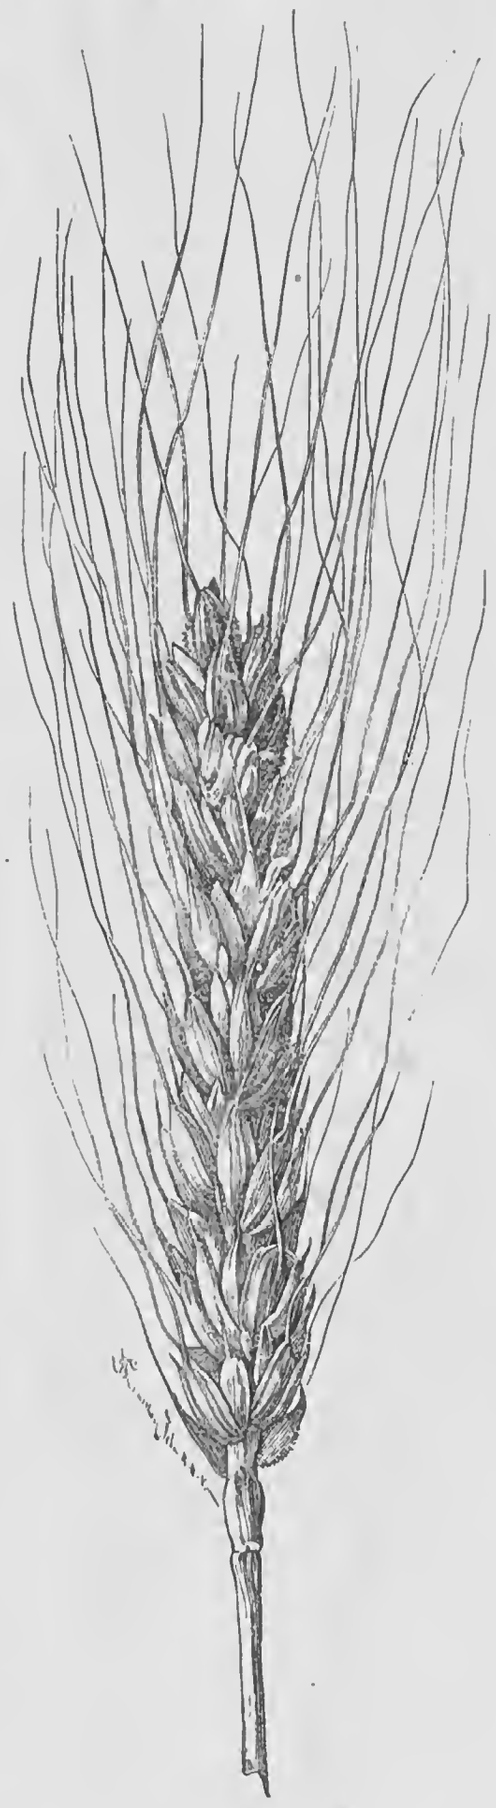
We like and attach importance to the plan of rolling the ground after it has been prepared for the seed and before the seed has been put in. While the soil should be finely pulverized, it should not be left in too light and huffy a condition. The roots will be stronger and the crop will stand the Winter better if the soil is made compact and firm. Thorough drainage is essential, but wheat will do well on moist soil—much better than rye. The bottom lands of the Mohawk River this year have produced an average of thirty-four bushels to the acre without any manure. Under our system of putting wheat on sod, a meadow may be renewed in one year, which is often desirable. The usual practice, however, with our farmers is to make wheat the third crop in rotation, following oats and corn. When this is done, more manure is required than with a sod seed-bed. The oat stubble should be plowed under as soon as possible after the crop is taken off, while the juices are still in the stubble which adds materially to its value in enriching the soil. In all cases, manure should be spread upon the surface for wheat and a liberal application will always pay in strengthening the roots for Winter and causing it to stool more plentifully. Commercial fertilizers pay as well on wheat as on any other crop, if not better, by giving it a good start, which is a great aid in affording more ample protection for Winter.

SOFT WHEAT IN GERMANY.

PROFESSOR F. H. STORER.

THE editorial remarks on "soft wheat" in the RURAL of July 30th, suggest the observation that it is not among American millers only that "there is a growing agitation against soft wheat." I have recently read in one of the agricultural periodicals of Germany a vigorous protest from an association of millers against the growing of soft wheat, and I could not but remark that there must probably be a good deal of truth in a prejudice so widely spread as this one seems to be. The German article was, in fact, couched in terms not unlike the expressions of the American millers to which the RURAL editorial referred. The argument was, briefly, that in recent years certain rough or bearded varieties of white English Winter wheat had been introduced into North Germany and largely grown there, especially in districts where beets are cultivated for sugar making; and that, since these English wheats yield more abundantly than the ordinary native varieties, they have been a good deal sought after and esteemed by the farmers. But the writer urges that, for the community at large, no real advantage is gained by the cultivation of the English wheats, since, when considered as food for the support of human beings, they are vastly less efficient than the ordinary native wheats of the region. The English wheats, he goes on to say, have a preponderance of starch; their gluten is comparatively small in quantity, and poor in quality; and the flour made from them is ill fitted for making bread. Taken by itself, the flour is really not fit for baker's use, being much more suitable for the starch factory. The only way that the baker can use such flour is by mixing small quantities of it with a large proportion of flour prepared from wheats rich in gluten, and, even then, he is apt to complain that the mixture of flours does not bake well. In case it should come to pass that no other variety of wheat beside the rough English were grown in a given locality, it would be absolutely necessary to import hard wheat from abroad in order to make good bread.

But, in fact, the German millers will not buy the English wheat at all after they have once made acquaintance with it; or, if they buy it, they do so at a greatly reduced price. Some of it is, consequently, sold to starch-makers; but for the most part it has hitherto been worked off by mixing it with other kinds of wheat, to be sold to distant markets—to the great detriment, as the writer urges, of solid business and to the positive injury of those farmers who continue to grow the native varieties, since their product shares the doubt which has been cast upon the grain of their neighborhood. This system of admixture had attained such proportions that the directors



VELVET CHAFF—FROM LIFE—FIG. 452.

of the Produce Exchange at Hamburg decided, some months since, to exclude bearded English wheat from their market. Since the first of June last past it can no longer be offered for sale there. The writer concludes by urging his readers to exert their utmost influence to prevent the further spread of the English wheat into other German provinces.

The article in question is interesting as illustrating the feelings of persons looking at the matter from a limited point of view. The small-way millers, and the statesmen even, of a little German Duchy will naturally view the question according to the limitations which hamper them. The American farmer, on the contrary, works in a wider field. His products are sought for by a great variety of consumers, and put to manifold uses. He will naturally continue to grow those varieties of wheat which best suit his royal pleasure. For him, the question is absolutely one of market price—as determined not by the wants of his immediate neighborhood alone but by those of the entire world. If he can find his profit in growing soft wheat he will undoubtedly continue to do so, no matter what millers may say or what the relative proportions of starch and gluten may be. And the miller, for his part, will, of course, buy those kinds of wheat he wishes for, and he will buy them in the places where they can be got most advantageously.

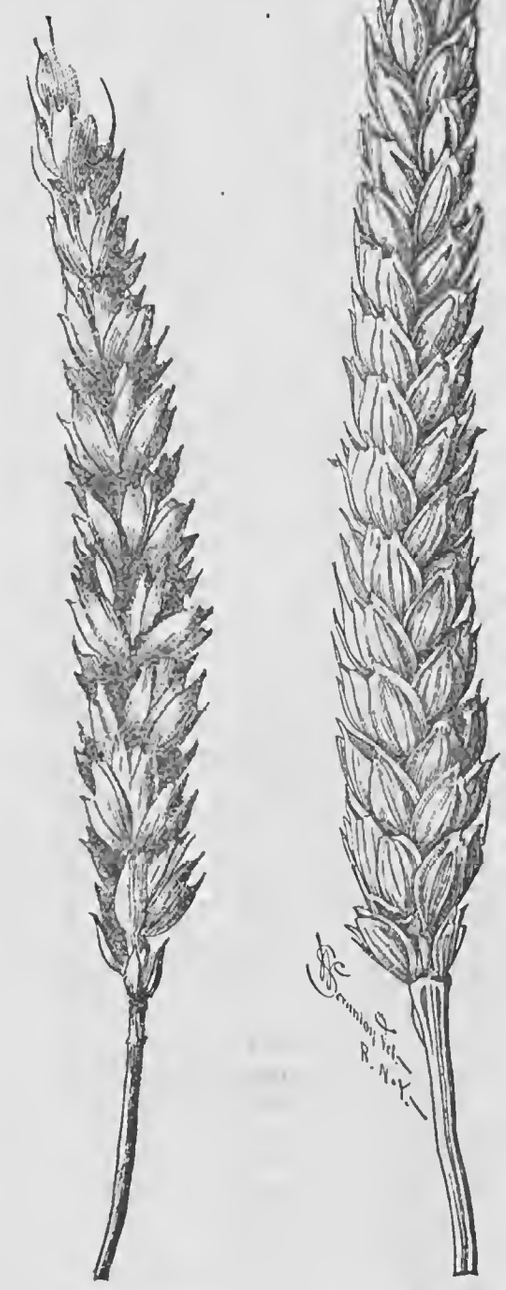
RYE TO THE RESCUE.

B. F. JOHNSON.

A SMALL portion only of the regular readers of the RURAL NEW-YORKER can be brought to understand the magnitude of the drought of this Summer in the West and South; nor would it be easy to afford them a correct conception of the disasters wrought by the combined forces of the Hessian Fly, the chinch bug and drought to Winter and Spring wheat and Indian corn. I suppose five hundred million bushels less for the three would be scarcely too high an estimate. But in the Winter wheat belt, where wheat is the leading cereal and the main crop of the country, the work of destruction of the chinch bug is not at an end for this year; for he will surely continue his ravages on the newly sown wheat just as soon as the green blades appear above ground, unless copious rains fall, which are quite out of the question for months to come. In view of this fact I have thought it advisable to use the columns of the RURAL, which is widely circulated through this region, to state some important facts in respect to Winter rye, and tell how it may be made to come to the rescue and partially supply the place which wheat would fill under ordinary circumstances.

On account of the sun-baked, compact and hardened state of the soil, due to prolonged drought and to the excessive heat, it has been and will be found impossible to do that breaking of the soil and make that fining of its substance, which are among the essentials in preparing the land for wheat. Besides, if after infinite labor the soil is so prepared and the seed sown, there is no security there would be moisture enough to germinate the grain, or at best it would do so only partially, and the seed would be lost. But in case enough rain falls to germinate the grain after seeding and by the first of October—and for the Winter wheat belt, that date is as late as the seeding can be deferred with safety to the crop—the moment the young wheat blades appear above the ground, the chinch bug, which is many-headed and lives over the entire Winter, will fasten upon them and suck the life and juices out of the plants. Moreover, there are almost certain signs in the heavens of a dry Autumn, and if a dry Autumn, a long, dry, cold and very severe Winter is almost a sure event. In that case, the wheat crop if sown early and getting a good start and stand, will run great risk of severe injury, and if sown late and weakened by the chinch bug, the crop will be almost certainly lost. These are fatalities which happened to the Winter wheat crops harvested in 1874, 1875 and 1881, and the crop of 1882 is almost sure to suffer in the same way; for it has been for a long time observed and recently clearly proved and demonstrated by Professor Thomas, State Entomologist of Illinois, that dry seasons and wet ones in the Winter-wheat belt, repeat themselves with more or less regularity every seven years and, therefore, that the coming and going of chinch bugs may be calculated and foretold with accuracy to a month.

But as a compensation in some measure for the failure of Winter wheat, we have a precious resource in Winter rye, which, while less valuable in many respects than wheat, may be justly considered the cereal of greatest importance after wheat and Indian corn. In the first place, in respect to the chinch bug, rye, like oats, is no favorite with it, and it seldom attacks either when there is barley, wheat or corn near. Besides, and here are facts of vast significance, first, the seeding of rye may be deferred in dry seasons with perfect safety to late in October, or a month later than wheat; and, second, it may be harvested from ten days to two weeks earlier and thus escape the ravages of the chinch bug, because he is chilled beyond doing serious damage in the Fall and not yet numerous enough nor yet ready for serious work in the Spring. While rye is impatient of too much moisture and will not stand half as much rainfall, overflow or soaking of the soil as wheat, it appears to be indifferent to Fall and Winter droughts and prolonged cold, and never makes so good crops as in those dry, cold Winters in which the wheat crop is more or less seriously winter-killed. This is what happened in the cold and dry and very snowy Winter of 1874-5, when the wheat crop was very badly hurt, as the same thing is almost sure to happen in the Winter of 1881-2. While only about two-thirds as much rye is required to seed an acre with it as an equal area of wheat, the cost of the former is less than two-thirds of the latter, but at the same time rye has become so scarce that it has risen from 70 cents in 1880 to $1.00 in 1881, and during the year has been higher than wheat, selling for $1.25 at a time the latter sold for 30 cents less.



YELLOW MISSOURI. FIG. 453.

"GOLDEN GRAINS," From life—Fig. 454.

At this juncture when and after both the Winter and Spring wheat crop of 1881 has been reduced one or two if not three hundred million bushels by drought and insects, and when the Fall crop is in very great danger of being largely abandoned by the impoverished farmer and lost if sown, he cares not to risk and lose the seed and labor of another crop, we have the grand resource of rye offered to us, and it seems to be specially the duty of such wide-read and influential papers as the RURAL NEW-YORKER to bring the fact prominently before the farmers of the country and especially those of the valley of the Mississippi. Further, it is the result of twenty-five years' observation in the West, that the farmers under many and various, if not all, circumstances have no such liberal and enlightened friends and advisers as the leading spirited and active agents of the great railroad lines, and, therefore, I ask of you that this matter of sowing rye as a substitute for wheat at this critical time be brought to their attention, that they may, as they surely will when they understand the subject, bring their influence to bear upon the matter in hand.

Champaign Co., Ill.

WHEAT RAISING IN MISSOURI.

This portion of the State can hardly be called a wheat-growing section; still, as a rule, every farmer raises enough for his own family, from 10 to 20 acres being the average wheat area per farm. Care enough, however, is not given to preparing or seeding the ground, to produce good crops—a carelessness that causes many failures. I have seen wheat sown on corn land without any previous preparation except cutting off the corn. Perhaps the last plowing received by the corn would have been about the middle of June, after which the land would remain undisturbed for at least three months; then the wheat would be sown on this ground packed hard by rain and sun, and a slight stirring of the soil, just to cover the seed, would be the only labor bestowed on the seeding. In many cases, I've seen the weeds and Crab Grass so

thick as entirely to hide the ground. Of course, no one could expect a good yield from such a crop. I do not mean that all wheat here is put in, in this way; but the practice is by far too common, and it is those who raise crops in this slip-shod manner who are loudest in their complaints that wheat raising hereabouts doesn't pay—and, most likely, it doesn't when conducted in this fashion. The crop this year has been exceptionally bad even on the best prepared land, for the finest fields of wheat were eaten up by the chinch bugs. So complete was their work that an experiment I had made in applying salt to wheat gave no result, for not a single head was made in the entire field. Nearly the same disastrous fate befell another field with which I had taken special pains, having plowed the ground deeply and thoroughly harrowed and dragged it and drilled in one bushel and an eighth of clean seed to the acre. In spite of my pains, this field will hardly average six bushels per acre, the chinch bug having killed at least half the crop after it had begun to head out. Experience has taught me that wheat requires a finely pulverized seed-bed at least three inches deep, under which the ground should have been previously well stirred and then made thoroughly compact by dragging, harrowing and rolling. The best way I find to prepare the ground for wheat is to plow it deeply and thoroughly at first; then roll and drag it until it is compact, and then pulverize the seed-bed with a good harrow. Good, clean seed drilled in such a seed-bed will, with anything like a favorable season, always yield a profitable crop.

Miller Co., Mo. N. J. SHEPPARD.

California Wheat Notes.

SONORA was always considered our best wheat for poor, dry lands. Six years ago, in a very short and dry season, a note was made of the time it took to mature a crop of grain, and it was found that in 80 days from the day of sowing it ripened. A number of us selected the heads that ripened earliest and sowed the kernels from them and again selected the heads that ripened earliest and sowed the seed from them; and so on, till this year Sonora ripened from *soaked seed in 69 days* from the day it was sowed. We have christened this improved, pedigree, "Sonora," the

RED MEXICAN—the earliest wheat in the world and the best adapted for growth on poor, dry soil.

ITALIAN is a wheat not extensively raised, and why raised at all, I can't see, as there is nothing superior about it.

CHILI is a superior wheat, of large yield, under favorable conditions yielding one-third more than Sonora under like conditions, but under unfavorable conditions of dryness and poor soil, 'twill not make growth enough for hay where Sonora will yield eight to ten bushele per acre.

PROPO is similar to Chili; and requires a season of 90 days at least to make a crop.

CLUB is an old, well known variety, not of superior quality, but having the advantage of stiff straw, not liable to fall even in the heaviest growth: yields well under favorable conditions. W. A. SANDERS.

Fresno Co., Cal.

Wheat Growing in North Carolina.

THE time was when the wheat crop of North Carolina was one of considerable importance. Then a large acreage was planted after tobacco, which, of necessity, received thorough cultivation, and was removed from the land in time to allow of thorough preparation for wheat which almost invariably followed, and almost as invariably was a remunerative crop; but all this is changed now. Since labor has been beyond their control, planters dare not risk the large fields of tobacco of former days, as the lack of help at the critical moment might result in the destruction of the whole by worms. Thus, from having a large surplus of wheat for market, we have come down to little patches here and there, falling far short of enough for home consumption. Formerly Peruvian guano was used for wheat profitably; but since the market has been flooded with adulterated and spurious gumos, we have become discouraged and either depend on cotton seed as a fertilizer for wheat, or use none at all. As a natural consequence, when we cease to look upon any crop as a source of profit, we become careless in the selection of seed as well as in the manner of planting. This is generally done by merely sprinkling (I can't call it sowing) the seed broadcast and plowing it in with a shallow furrow—and the work is done. When we prepare the soil properly and apply 40 to 50 bushels of cotton seed, costing about eight cents per bushel, we are enabled to raise the yield from a paltry three to five bushels per acre to one of 12 to 20 bushels. Under the present tenant system, the tenant having no assurance of his holding except until Christmas, we cannot look for much improvement in the matter of wheat growing, nor in many other respects. Only where the farmer owns the soil he tills, do we see wheat fields worthy of the name. M. B. P.

Cultivation of Wheat.

An experienced farmer who has made the wheat plant and its cultivation a careful study for years writes to us that the expense attending the cultivation of wheat—like corn or vegetables—is much less and its value much greater than farmers are willing to allow. When sown in drills 12 to 18 inches apart, it can be easily cultivated by the drill itself. The value of one cultivation, when all conditions are favorable, is equal to about double and often treble the expense. In large fields as well as on small plots it has been proven beyond a doubt that the farmer makes better grain and more of it by sowing thin and cultivation. The cost of one cultivation is just double the cost of drilling. In each space the drill hoes should run twice when the wheat is half done stooling, or is three or four inches high.

WHEAT PREMIUMS.

IN THE RURAL of May 28, 1881, the following announcement was made:

The RURAL NEW-YORKER begs to offer in articles of its own selection, for the longest and heaviest five heads of wheat from the next crop, $50.00, to be divided into first, second, third, fourth and fifth premiums. The awards will be published in our Special Wheat Number, and drawings presented of the prize heads.

When these premiums were offered, we had but little idea of the very general interest that would be taken in competing for them, but we have now to announce that not less than five hundred specimens of five heads each, have been received. Owing to the fact that many of these specimens were unnamed, and that in many other cases the packages and letters referring to them could not be placed together because there were no names or legible postmarks on the packages which enabled us to do so, we could not enter them upon our list. So, in justice to them, we would say that, in many cases, the difference between their specimens and those to which the premiums have been awarded was but trifling. In fact there were at least fifty specimens which were so nearly alike in size and weight that there was no "best" among them. All were equally entitled to premiums.

As we had already prepared an engraving of Black-bearded Centennial from our own crop of this wheat, it was not deemed necessary to present the prize head, which differs from it only in size.

Prize-Takers.

FIRST PREMIUM.—Prof. A. E. Blount, Fort Collins, Col. Black-bearded Centennial. Number of breasts of average head, 27; number of grains in average head, 104; average number of grains to a breast, 3.8; weight of grains per head, 107 gr.

SECOND PREMIUM.—John H. Kreuse, Portland, Oregon. Chili Club: Number of breasts, 28; number of grains, 131; average number to a breast, 4.6; weight of grains per head, 92 gr.

THIRD PREMIUM.—R. L. Smith, Tangent, Linn Co., Oregon. Clawson: Number of breasts, 22; number of grains, 101; average number of grains per breast, 4.5; weight of grains, 87 gr.

FOURTH PREMIUM.—John Brown, Brownsville, Linn Co., Oregon. Defiance: Number of breasts, 23; number of grains, 96; average number to a breast, 4.1; weight of grains in head, 58 gr.

FIFTH PREMIUM.—Lewis Kesby, Shepardsville, Mich. Clawson: Number of breasts, 20; number of grains, 72; average number to breast, 3.6; weight of grains, 47 gr

The following list is made up from those packages upon which the addresses were written:

1. Clinton Vass, Sussex Co., N. J.: Clawson. Longest head 5½ in.
2. W. S. Brooks, Seneca Co., N. Y.: Clawson, heads well filled, 6 in.
3. D. Rodegab, Seneca Co., O.: Clawson.
4. H. C. Denning, Monroe Co., N. Y.: Clawson, 6½ in.
5. G. A. Goff, Jr., Chemung Co., N. Y.: Clawson.
6. Claude H. Wixom, Yates Co., N. Y.: no name, resembles Clawson, 5 in.
7. Clarence R. Pratt, Wayne Co., N. Y.: Kentucky White, 1¼ in.
8. W. J. Swift, Dane Co., Wis.: Scotch Fife, three and four grains to a breast. Kernel large.
9. M. F. McLoud, Beaver Co., Pa.: several specimens badly damaged.
10. Jesse Owen, Chemung Co., N. Y.: Fultz; Longest 6 in.
11. W. H. Little, Ontario, Canada: Clawson, 6 in.
12. William H. Morrell, Medina Co., O.: received without contents.
13. John Awde, Ontario, Canada: no contents.
14. Oliver H. Waters, Niagara Co., N. Y.: Red Chaff Mediterranean.
15. Isaac Hemstreet, Jr., Erie Co., N. Y., Clawson, 5½ in.
16. Henry L. Bonnell, no address: Eclipse (?) so-called, longest 6¼ in.
17. M. M. Curtis, Vernon Co., Wis.: box broken.
18. Levi Hough Falconer, Chautauqua Co., N. Y.: Wicks, Clawson, Rio Grande Spring, Rio Grande, Winter.
19. W. B. Derrick, Ogle Co., Ill.; North Ill.
20. J. W. Phipps, Grayson Co., Va.: Fultz, 5 in.
21. S. B. Parrolt, Hocker Co., O.: several kinds; no name.
22. G. N. Q. Roberts, Trumbull Co., O.: Democrat (bearded), 4 in.; California, 5 in.
23. T. Shurt, Muskegon Co., Mich.: Clawson, 5½ in.
24. F. Habecker, Niagara Co., N. Y.: Silver Chaff, 6 in.
25. J. H. Jewell, Bradford Co., Pa.: Clawson (probably), 7 in.; in green state.
26. F. B. Russel, Huron Co., O.: Blue Stem or Gipsey Wool.; Clawson, 5½ in.
27. William H. Snyder, Butte Co., Cal.: beautiful specimens.
28. Rev. W. S. Fontaine, Rockingham Co., N. C.: Clawson.
29. Joseph Galbraith, White House, no State: Black-bearded Centennial, Golden Grains; very good specimens.
30. H. A. Andrews, Delaware Co., N. Y.: White Russian Spring, 6 in.
31. Alonzo Allen, Boulder Co., Col.: Defiance, 4½ in.; Siberian Wheat, 6 in.; beautiful specimens.
32. B. F. Linderman, Boone Co., Ill.: Michigan Fife, 6 in.; no name (bearded), 5 in.
33. James Cummings, Otsego Co., N. Y.: White Russian, 5½ in.
34. D. A. Davis, Linn Co., Oregon: French Wheat, 4½ in.; close spikelets; large grains. Also sends fine specimens of oats.
James M. Waters, Ontario, Canada: Scott, 5 in.; Treadwell, 5 in.
35. G. B. Hollingshead, Ontario, Canada: Wild Goose (bearded), 3 in.; beards twice as long as head.
37. R. F. Coffin, Boulder Co., Col.: Egyptian, Siberian 4½ in.
38. M. C. Carr, Cumberland Co., Ill.: Mediterrancan, 5½ in.
39. Edwin Bradt, Cayuga Co., N. Y.: Red Stem, 5 in.
40. H. N. Likely, Fremont Co., Col.: Egyptian (fine specimens), main spike 5 in.
41. J. H. Spafford, Genesee Co., N. Y.: Clawson (probably).
42. Charles J. Bailey, St. Lawrenee Co., N. Y.: Clawson, 5 in.
43. J. D. Hedges, Walla Walla Co., W. T.: No name (beautiful specimens).
44. Lewis Kirby, Clinton Co., Mich.: Clawson, 6 in.
45. Eli Snyder, Rice Co., Minn.: Scotch Fife.
46. W. T. Sitler, Crawford Co., Pa.: Champion Amber, 5 in.
47. G. W. Prebles, Prince George Co., Va.: No name (several specimens).
48. W. W. Corson, Bradford Co., Pa.: Clawson (fine specimens), green, longest 7 in.
49. Jacob Vrooman, Jefferson Co., N. Y.: Clawson 5½ in.
50. Lewis Pooler, Cayuga Co., N. Y.: Log House (bearded), 5½ in.; Lancaster, 4 in.; Clawson, 5 in.; Fultz, 3½ in.
51. J. M. James, Fayette Co., Pa.: No name.
52. A. H. Weld, Pierce Co., Wis.: Rio Grande (bearded), 4½ in.; Defiance, 4 in.; Scotch Fife, 4½ in.; Blue Stem, 4½ in.
53. Caleb Davis, Lane Co., Oregon: Australian Club.
54. T. Allen, St. Lawrence Co., N. Y.: Silver Chaff, 6 in.
55. Alexander Reed, Garret Co., Md.: Red Chaff, Mammoth White Wheat, 6 in.
56. S. Washburn, Susquehanna Co., Pa.: White Russian, 6¼ in.
57. Wm. Moore, Preble Co., O.: Acton, 4 in.; no name 5 in.; Fly-proof, 5½ in.; Camp Ground (bearded), 5 in. [This wheat has come to us under a dozen different names.—EDS.]; Kentucky, 4 in.; Clawson, 5 in.; Michigan Amber (bearded), 4 in.
58. John Butler, Prince Edward Co., Va.: American Eclipse (bearded), a new cross, close spikelets, 3½ in.
59. Jos. Schneeberger, Ingham Co., Mich.: Diehl, 2½ in.
60. David Porlous, St. Lawrence Co., N. Y.: White Winter, 5 in. (resembles Clawson).

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, SEPT. 10, 1881.

TO OUR SUBSCRIBERS.

During the same length of time we have never before received so many words of appreciation and good will from our readers as during the present year.

We hope this has been merited. Whether it has or not, it has been gratifying to us beyond measure, and we are moved to return our sincerest thanks to our patrons. The wish still further to improve this journal is sincere and constant. But we beg to say that the margin between our receipts and expenses is but narrow. It may be said without arrogance or exaggeration, we hope, that there is no other rural journal that pays more for original illustrations; no other that is printed upon better paper; no other whose pages are filled with a higher class of original matter. The changes in our present number will be apparent to our readers without further remark. It is designed to maintain the Rural New-Yorker during 1882 as it now appears, without change in the subscription price, whether our future increase in circulation shall justify it or not. We respectfully ask from our readers what we have often asked before, viz., that they will mention the Rural New-Yorker to their friends in such terms as in their estimation it seems to deserve.

Under notes from the Rural Farm, the yield of many kinds of wheat spoken of is merely estimated. The exact yield of all the kinds will not be known for several months.

The inner kernels of wheat spikelets are always smaller than the outer ones, and they are later in ripening. In establishing any new variety of wheat from cross-breeding, the outer kernels should alone be saved for seed.

We beg again to call the attention of farmers to the fact that whether a variety of wheat bears two or three grains in a breast makes a difference of one-third in the yield, all else being equal—a fact which, apparent as it is, we believe the Rural New-Yorker has been the first to call special attention to.

As a character by which to distinguish wheat, the color of the chaff should never be mentioned. For example, in Colorado, the chaff of Clawson is white; in certain parts of New York and Pennsylvania a light buff-brown; in other parts of the same States, a dark brown. And the same may be said of most other varieties.

Mr. Klippart states, in his book on the Wheat Plant, that the middle kernel of a breast or spikelet is larger than the outer ones, and he gives illustrations showing the difference. Now, in the generality of wheats the middle floret proves sterile, or rather most of them do, and when fertile the grain is, as a rule, as much smaller than the outer grains as Mr. Klippart makes it larger.

The beards of bearded kinds of wheat add materially to the weight of the heads. Given the weight of kernels to be the same, and the strength and hight of straw, as between bearded and beardless kinds it is plain the bearded will lodge before the beardless. Beards are of no known value. Hence, all other things being equal, it is desirable to cultivate beardless kinds.

Fig. 447 on page 621 shows the instrument used at the Rural Farm for crossing wheats. It answers the purpose nicely. The blade is made of cigar box sharpened at one end and receiving a camel's-hair brush at the other. The brush end is used for collecting the pollen—the other (pointed) end for opening the palets and removing the anthers.

Clawson Wheat is so well known that it was not deemed worth while to have a sketch made of one of the premium heads. The engraving of Black-bearded Centennial on page 619, is not of Prof. Blount's, but a fair average of those raised at the Rural Farm. So far as can be seen, the head of the so-called "Golden Grains" is merely the Black-bearded Centennial, minus the beards which, as is elsewhere stated, fall off when fully ripe and dry.

Our older readers will remember that we succeeded in carrying the Lost Nation (Spring) Wheat through the Winter of '79 and '80. Of last year's crop we selected the largest heads for seed and planted them Oct. 5, ten inches apart each way, in a plot carefully prepared. Nearly every plant was killed, the entire yield being only two heads. We may therefore consider our effort to change this to a Winter wheat a failure.

It seems to be generally conceded that wheat needs a mellow surface and a greater or less degree of compactness underneath. In one of our trial plots the western part was used for men and teams to pass to and from the other parts of the field. The ground therefore became hard. The surface was somewhat mellowed by the harrow, and the seed drilled in. The wheat on this part of the plot was at least as heavy as on the eastern portion, which was not used as a thoroughfare.

Of all our wheats, many of which were sown as Winter wheats for the first time, very few would have been appreciably winter-killed had the land in all parts been so drained or leveled, that the water could not have long remained on the surface, or beds of ice have formed. There is no wheat hardy enough to grow under such conditions, and it is of the first importance, therefore, that in fitting our lands for wheat, hollows should be filled in or thoroughly drained.

Those of our readers who are raising the Rural Branching Sorghum would oblige us if they would cut some of their plants just above the ground—say six inches. The value of this plant can never be known until the rapidity and luxuriance of the second growth are ascertained. The question as to whether it will seed here or there seems to us unimportant. A small quantity of seed serves for a considerable area, and plants enough to yield a sufficient amount of seed may be started in frames, hot-beds, or in the house as explained in previous numbers.

Fultz is unquestionably one of our hardiest wheats, and it has been said that it is of all wheats the best adapted to ill-drained land. To test this we sowed (drilled), on a poorly-drained plot of half an acre, three-and-a-half pecks of seed. Missouri Yellow was raised upon the same plot last season. The land was plowed and harrowed Aug. 15. Again, Sept. 23, it was harrowed with a disc harrow both ways; then with an iron tooth; then rolled. Concentrated fertilizers, 250 lbs. (raw bone), were sown, and the seed then drilled in as above. The yield will not exceed six bushels. The lesson we learn is that it is better not to sow wheat at all than to sow it on poorly-drained land—no matter how well it is prepared or what kind is sown.

Productive Wheat from Dr. J. B. Lawes.—As we do not always get the greatest yields from those kinds of Indian corn which bear the largest ears, so we must not necessarily look to varieties of of wheat which bear the largest heads for our heaviest wheat yields. A letter received from Dr. Lawes (Rothamsted, England) a few days ago, incloses a single head of wheat which is barely three inches in length. Of this he says: "I inclose a head of one of the varieties which has proved to be very productive in this country. What it will yield this season I do not know—possibly fifty bushels per acre." Again he says: "I generally sow two bushels per acre the end of October." The kernel of the head sent by Dr. Lawes is only of medium size, of an amber color. But there are twenty spikelets on both sides, most of which have four grains.

IMPROVED VARIETIES OF WHEAT.

While great and successful efforts have been made to improve most of our ornamental plants as well as those cultivated for their seed or fruit, is it not surprising that the wheat plant, which stands foremost among the agricultural crops of the country—of the world, should have been so overlooked, so neglected? Recognizing this, the Rural Farm years ago by selection; by changing Spring varieties into Winter varieties; by testing every kind it could procure from whatsoever source; and, of late, by cross-breeding, has obtained a great number of varieties, many of which seem, as thus grown at the Rural Farm, to be notably superior to those in general cultivation. Those who visit us express surprise, as they examine our wheats, at seeing among them heads and kernels of a size larger than any which they had deemed it possible to raise in our soil and climate. These wheats may not thrive as well elsewhere as with us. Only a comprehensive test could determine this, and it will be two or three years before we can distribute any of them among our subscribers. But we shall cultivate them with that object always in view. Such work is one of the many pleasures of earnest, liberal-minded agricultural journalism.

THIN SEEDING OF WHEAT.

Captain Jared Abrams last year raised the largest quantity of Clawson wheat to the acre of any of the farmers in the neighborhood of the "Rural Farm." We interviewed the Captain as follows:

"How much wheat did you raise per acre?"

"Thirty-four bushels."

"How much manure did you use?"

"None," he replied. "The land was in onions last year and well manured then."

"How much and what kind of manure did you then use?"

"Twenty-five loads of farm manure."

"Did you then drill in the seed or sow it broadcast?"

"I drilled at the rate of one and three-quarters bushel per acre."

"If with your present experience you were to set about producing a greater yield of wheat, would you use more or less seed?"

"I should not use more."

"Are we to undersand you would use less?"

"I should rather sow less than more," the Captain laughingly and somewhat evasively replied.

It should be stated that this farmer some years ago strenuously advocated two bushels and over to the acre, and that of late years he has been reducing the quantity.

THE FIRST GREAT GRAIN BLOCKADE.

Several times we have called attention to the evils of the grain blockade which of late years occurs every Fall at the termini of most of the great Northern railroad trunk lines. This blockade is injurious alike to the trade of the place where it impedes traffic and to the farmers and grain dealers along the line of the railroad whose terminal storage capacity is insufficient. Last year the worst blockade of this sort was at Baltimore, and in spite of the notice then given of the need of greater storage room there, a similar blockade has, thus early in the season, already demoralized the Baltimore grain trade. Warned by the trouble last year, the Baltimore and Ohio Railroad has built a new elevator which will be ready to receive grain to-day, so that no embarrasment will be felt with reference to that line; but the Northern Central's elevators, capable of holding only about 1,000,000 bushels, are already overflowing, while about 2,500 grain-loaded cars now blocking up all sidings as far north as Harrisburgh, Pa., contain about 1,500,000 bushels—more than enough to repack all the storage room were its present contents at once removed. The railroad company lays the blame on the produce speculators, who, instead of shipping the grain within a reasonable time, are holding it back for higher prices; while the grain dealers insist that it is the duty of the railroad company to provide ample storage room for all the freight it brings. The railroad threatens to raise the storage fees on grain now in the elevators unless at least half a million bushels are at once removed; and the grain dealers threaten litigation in case such an increase is made. The merits of these recriminations interest us but little; but for the interests of the farming community, we trust their outcome will compel a better management of the grain received at the chief collecting points.

THE DROUGHT AND THE CROPS.

From nearly all parts of the country the mail and telegraph have lately been bringing news of a disastrous drought of exceptional length and severity. Its severity and long continuance may be estimated from the fact that from August 1st to September 2nd the rainfall amounted to only 1.55 inch in New York, 1.16 inch in Buffalo; 2.03 inches in Albany; 1.85 inch in Montreal, 1.18 inch in Philadelphia; 0.57 inch in Oswego; 0.50 inch in Lynchburg and a still smaller precipitation in most other sections, except in the Northwest, where 3.20 inches fell at St. Paul, Minn., and 3.82 inches at Des Moines, Iowa.

Corn, which even before the drought was in much poorer condition than last year, has been still further damaged, probably to the extent of a couple of million bushels; cotton, which promised an exceptional yield, will most likely prove a smaller crop than that of last year; tobacco, according to the latest advices from Virginia, North Carolina, Kentucky and Connecticut, will be a very short crop; pastures have been literally burnt up, and stock have had to be fed or struggle along in a half-starved condition on the scantiest sort of herbage; streams everywhere have been extraordinarly low; wells have dried up, and all industries depending on water for motive power, have been more or less paralyzed, and in most sections water for stock and even for household purposes has been scarce. Over most of the West this terrible drought was partially broken up last week, over three inches of rain having fallen at Springfield, Ill., in less than an hour on August 31, and two-and-a-half inches at Des Moines, Iowa, in three hours. According to a report of the Signal Service sent here on Friday evening last, the rainfall during the preceding week at 23 stations in the South was 0.95 inch, against 1.41 inch dur- the corresponding week last year, and 0.16 inch during the week before, the heaviest precipitations having been 6.04 inches at Charleston, S. C.; 3.42 inches at Smithville, N. C. and 1.20 inch at Montgomery, Alabama. Everywhere, however, the rainfall came too late to prevent a world of damage and was insufficient to satisfy the needs of the thirsty earth and of the parched vegetation.

BREVITIES.

Does any one of our farmer readers recall that he ever prepared a field for wheat too carefully?

A farmer remarked to us while looking at a red-strawed wheat that he preferred red to yellow straw, having found it stronger.

The season for wheat at the Rural Farm was not favorable to a heavy yield. Rains and cloudy skies prevailed from first to last, and the grain of all kinds was shrunken.

A letter just received from Dr. J. B. Lawes, of Rothamsted, England, dated Aug. 27, says: "I am sorry to say our harvest is in a very critical state. I began to cut wheat on the 1st of August and it is not carried in yet."

If an acre be laid off in ten-inch squares it will take, in round numbers, 67,500 grains to plant it. Suppose that every grain were to produce 20 heads and every head 20 grains. Allowing 600,000 grains to the bushel, we have a crop of 45 bushels to the acre.

It will be seen by reference to Prof. Shelton's interesting article on "Western Wheat Experiences" that wheat does not shrink from evaporation in the bin when put up perfectly dry. Two careful tests which he made showed there was a slight increase in weight.

The Genesee Valley was once famous as the wheat region *par excellence* of the United States. Other and wider wheat areas "carry the belt" now, but not owing to any wearing out of the Genesee lands if the account given by Mr. J. L. Lyons of that region, at an Eastern Farmers' Club, be correct. He said that 56 bushels of Fultz wheat to the acre had been raised there, and that Mediterranean yielded 30 to 45 bushels per acre last year.

A *breast* or *spikelet* of wheat is the same thing. Some breasts or spikelets bear three; others five flowers. In the three-flowered, the middle one is often abortive, as in Clawson, which usually, therefore, bears but two grains. In the five-flowered, two are usually abortive, so that the breast bears but three kernels. These differences make, of course, a great difference in the yield, and we should by selection endeavor to establish and to cultivate those varieties which bear three or four grains in a breast. The outside sheaths (chaff) of the breast are *glumes* and correspond to the calyx of other flowers. Immediately within a glume or external chaff are two other sheaths which are called pales, palets or paleæ. The outer of these alone, in bearded kinds, is bearded, while in beardless varieties, merely the rudiment of a beard or awn appears. Between these two palets, as elsewhere stated, are to be found the reproductive organs—the stamens, pistil and ovary.

WHEAT RAISING IN SOUTHERN WIS.

In Southern Wisconsin since the advent of the chinch bug and other enemies of the wheat plant, farmers have practiced sowing oats with their Spring wheat. They call the mixture succotash. They mix one peck of oats with seven of wheat to the acre: that is, two bushels of grain to the acre, and they ordinarily get 10 bushels of wheat and 20 or 25 of oats to the acre, and the wheat is more plump and better in every way than wheat sown by itself. The theory is that the growth of the oats is so luxuriant that the insects can eat their fill and yet make no impression on the crop. We do not have snow enough here to sow much Winter wheat, as it is likely to be winter-killed, and Spring wheat sown by itself is, of late, an uncertain crop. There are mills to separate the oats from the wheat. The flour is not always as white as the best "superfine," because a few oats will be left in the wheat, but it makes a very good quality of bread, and growing succotash is much more economical for a farmer than to buy his bread. The use of salt on wheat in Spring is coming into great favor. It stiffens the straw, and the wheat is said to fill better. More benefit is derived from the use of it in a dry than in a wet season. A VOLUNTEER.

Walworth Co., Wis.

Miscellaneous.

TRUTHS FROM KANSAS.

Statistical Information of Crops and Stock.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

"DROUGHTY KANSAS," forsooth! It had not that appearance to the writer as he picked his way through the muddy streets of the capital city of this great Western commonwealth, on the 26th day of July, clad in a suit of water-proof, and further sheltered from a pouring rain by a Paragon umbrella. Nor was this rain which welcomed us at Topeka merely a local shower; for in the Land Department of the Atchison, Topeka and Santa Fe Railroad we saw a budget of telegrams from points all along the line, reporting abundant rains even to the western border of the State. Western Kansas has really had a greater rainfall this season than the eastern part of the State; both sections would have had enough for the crops, had it been a little more uniformly distributed, but the unequal distribution has here, as in most of the Central and Western States, worked great damage both to wheat and corn. A good, generous rain throughout Kansas two weeks before wheat harvest would have doubled the gathered crop; and if the present copious showers had fallen only a fortnight earlier, the corn crop would be 25 per cent. larger; as it is, the State has no occasion to be ashamed of her aggregate cereal products for the year 1881.

Kansas has the best method of gathering and recording agricultural statistics of any State in the Union. The origin and perfection of the system are due to the late Secretary of the State Board of Agriculture, Alfred Gray, whose death was a national loss; for he would undoubtedly have been chosen as Le Duc's successor in the office of Commissioner of Agriculture—a position he would have filled with rare distinction and ability. Mr. Gray's excellent system is faithfully carried out in Kansas by his successor, Mr. J. K. Hudson, and is now closely imitated in the Agricultural Departments of Ohio, Illinois and one or two other States.

26,000,000 BUSHELS OF WHEAT.

FROM the May and June reports to the Kansas Board of Agriculture, we cull and compile the following interesting statistics; the figures are official, and not the mere estimates of your correspondents. After deducting the number of acres of wheat which were winter-killed, and those destroyed by noxious insects, the acreage harvested this season was 2,217,000, or about 225,000 acres less than in 1880; but the average yield throughout the State will fall little short of twelve bushels to the acre, whereas in 1880 it was only ten bushels; thus the total wheat crop of Kansas for 1881 will exceed 25,500,000 bushels, nearly a million more than last season, though produced upon an acreage ten per cent. smaller. As late as the 10th of May a practical farmer and good guesser going among the wheat fields of Kansas, would have estimated the yield as high as 22 to 24 bushels per acre; the promise was magnificent. Just prior to that date there had been frequent rains, and the growth of the wheat was rank and rapid. Then followed three weeks of dry weather and intense heat, which in the soft condition of the grain, scorched and shriveled without ripening it. The wheat, however, of early planting, did well, neither the heat nor chinch bugs affecting it seriously, and the wheat on the uplands of the Arkansas Valley, where, as a rule, the ground had been carefully prepared, yielded better results than other portions of the State. The Mennonites in Harvey, Marion, and McPherson Counties are probably the most extensive wheat growers in Kansas, and in many instances they harvested 20 bushels to the acre. They have had the best success with a species of bearded wheat, which they call "Crim Wheat"; the name being derived from the Crimea, in Southern Russia, whence the seed was imported. Other excellent wheat counties are Sumner, Sedgwick, Reno, Rice, Barton, Stafford and Pawnee. We saw a 40-acre tract of wheat in Pawnee County, that would thrash 35 bushels to the acre. The leading wheat county in the State is McPherson both in acreage and average yield to the acre.

120,000,000 BUSHELS OF CORN.

In the production of corn Kansas will be one of the foremost States this season. In view of the unfavorable reports from Illinois, Indiana and Ohio, we look to see Kansas take fourth rank among the States: Illinois, Missouri, and Iowa alone will probably exceed her crop. Two weeks ago our estimate of the total crop was 150,000,000 bushels, but the prolonged heat will cut this down at least 20 per cent. We think the reviving rains have come in time to prevent greater loss than this; 120,000,000 bushels from 4,000,000 acres gives an average yield of 30 bushels per acre, which is low for Kansas. Her rich bottom lands often produce 75 to 80 bushels, and in a very favorable season the State at large, has averaged 40 bushels. The population of Kansas is, in round numbers, 1,000,000; the foregoing figuses give 120 bushels of corn and 25½ bushels of wheat grown for every inhabitant. Let us add to this the live stock statistics, and we find that Kansas will not suffer at present for lack of bread or meat. The people will not only be able to meet the home demand bountifully, but to export largely both east and west.

In point of numbers there is little difference in cattle, swine, or sheep in Kansas at the present time. Sheep number about 1,000,000 or one for each inhabitant; this is an increase of 66⅔ per cent. over the number here in 1880. There are 100,000 more swine than sheep, and 100,000 more cattle than swine. All of these stock interests are daily increasing in magnitude, but the sheep interest is growing far more rapidly than the others. The partial failure of the grain crops in 1879 and '80 taught the farmers of Kansas, especially those of the Western half, a lesson which most of them have wisely heeded: that was the insane policy of confining their farming to field crops of whatever sort. They began at once to diversify their crops and to purchase stock, so that all the "eggs should not be carried in one basket." They recognized what they should have seen before—that they were living in the most favorable climate for stock raising in the United States, the very place of all places for flocks and herds. South Central and Southwestern Kansas have a latitude which insures exemption from prolonged and excessive heat in Summer, and from the rigors of a Northern Winter. Ordinarily sheep and cattle can graze the year round. This is made possible, not by the climate alone, but by the character of the prairie grasses. The nutritious Buffalo and Gramma Grasses afford pasturage in Winter as well as in Summer, and it is but rarely that the snow prevents grazing for a week at a time. Last Winter was exceptionally cold in Kansas, as all over the country, and much longer feeding of stock was required than is usual.

A PROFITABLE EXPERIMENT.

But a single instance of success in sheep raising during the past year will show that, notwithstanding the few extra weeks of feeding and shelter, this industry was more profitable than any other species of farming in the same locality. A number of Topeka gentlemen last Fall invested $3,500 in 1,000 grade Merino ewes and 10 thoroughbred Merino rams, and contracted with a practical sheep-raiser in Pawnee County to take charge of the flock. The sheep were simply loaned to the man for a term of three years, he to bear all expenses of keeping and feeding, and to be responsible for all losses in the original flock, as well as for all the increase that should reach maturity. His compensation for the labor and risk was to be one-half the wool clip each year and one-half the total increase at the end of three years.

It was our good fortune to see the first season's balance-sheet of this enterprise, and we think the items will be of interest to many readers of the RURAL NEW-YORKER. It should have been stated that 300 of the original ewes were yearlings that did not breed; the increase from the remaining 700 was 600 lambs; the wool clip from the flock was 5,698 pounds, which netted 20 cents per pound, or $1,140; one-half of this sum equals $570, which is more than 16 per cent. on the investment of $3,500. Then there are the lambs, which in the Fall (one year from the time of investment) will, at a fair estimation, add at least 24 per cent., making 40 per cent. in all for the first year. The increase of the second year, at 80 per cent., would be 800 lambs, and of the third year 1,040 lambs; the wool clip will increase in an equal ratio, and it is hardly likely that the price will decline, so that at the expiration of the contract, after giving the keeper his share of the flock, the company will have more than double the number of sheep they commenced with, and will have received an average yearly dividend of over 50 per cent., less, of course, deduction for any losses beyond human foresight to guard against.

What branch of business will pay equal to this? And our illustration is by no means an unusual case. If putting out sheep *on shares* is thus profitable, how much more profitable cannot a practical sheep farmer with a little capital make the raising of his own flock. The climate, the soil and the pasturage of the Arkansas Valley are all admirably adapted to promote the health of sheep; foot-rot there is unknown, and scab is rarely met with. Thousands of Kansas farmers are going into this profitable industry, and many sheep men from other States, and especially from Western New York, are bringing in large flocks; at the present rate of increase the number of sheep in Kansas next year will be 150 per cent. greater than now.

KANSAS STATE FAIR.

No State fair has been held in Kansas since 1874; but this year a new and vigorous association has been formed which promises to get up an exhibition of the agricultural resources of the State, that will be creditable and truly representative. The fair will be held at Topeka from Sept. 12th to 17th inclusive: great interest has been awakened in every county and the display promises to be one of the finest ever made in the West. The Fair Association offers liberal premiums for the exhibition of fine stock, and some of the leading stock-raisers in Missouri, Illinois, Ohio, Pennsylvania and New York have made application for entries of their best blooded animals. The Atchison, Topeka and Santa Fe Railroad will make a magnificent display of productions, agricultural, mineralogical and industrial, from along their various lines. The preparations of this company for the State Fair indicate a much more extensive and more artistic exhibit than they gave at the "Centennial," which many of our readers will remember as one of the attractive features of that great world's fair. After the State Fair the "Santa Fe" Company will transfer their entire exhibit to the Grand International Cotton Exposition at Atlanta, Ga.

This sort of enterprise by the railroads of Kansas has done more to stimulate immigration to the State than all other instrumentalities. Recently a tendency on the part of the better class of white people in the South to migrate North and West, has been noticed by the shrewd observers in this section; and it is a wise policy on the part of extensive land-owners to foster and encourage this movement. Two years ago Kansas was the goal of the colored "Exodusters" from the South, although the number of negroes who came was not nearly so great as has been represented by the press. This new exodus is more desirable, and will, it is hoped, assume large proportions. The Prohibitory Law is seriously affecting foreign immigration, but proves an inducement to an excellent class of American farmers and tradesmen to locate where their sons are not subject to the temptations of open saloons and liquor domination.

Literary.

THORNS AND ROSES.

CHAPTER I.

ON a hot Summer afternoon, when not a breath of air is stirring, it is possible to find a more agreeable seat than in a close railway carriage; or at least I thought so, as I gazed through the window at the ever-changing scene. For the last hour I had been alone, and had made myself as comfortable as possible under the circumstances. I could not, I thought, be very far from Stanton, and I tried to think the way was becoming familiar, though there was no reason why it should, as a child can scarcely retain a very vivid recollection of railroad landscape; and as a child I had last beheld the pictures along this route.

I began to dream about my past life—a very unromantic life it was, and that was singular as my name had long been linked with romance; how many Lovels were there left on earth now, I wondered. Myself, Kate Lovel, my aunt Dorothy, an unknown cousin, and a distant relative alone remained.

Of my father I had only a dim recollection; he had been an only son idolized by his parents and sisters: he had died a true gentleman, a gallant soldier; I could well remember listening to his praises, mingled with stories of Lovel glory, from my father's elder sister, aunt Dorothy, at that time established as mistress in my dear mother's place. Besides aunt Dorothy, I had another aunt, but had never seen her. I had caught whispers of a quarrel between her and my father; and as I grew up, I could guess pretty clearly what Barbara Lovel's story had been; and that she had robbed her sister of the lover for whose sake aunt Dorothy was still Miss Lovel; as my only playmate, I recollected a dark-faced boy who was often at our home, and to whom I used to run at any time, for we had been as brother and sister.

On my father's death, I, a child, was his sole heiress; he had left instructions as to my education, and desired that his house should still be his sister's home. I had been sent to school and had remained there until this day when I was returning home.

My school life was happy and tranquil; I grew up there, outstaying my first friends, until masters and mistresses might have regarded me as a fixture. I do not know that the fact of my being a Lovel helped me in my studies, or solved more easily the problems of decimals; but I was proud of my name and its historical glories.

I was called proud also; yet I won the love of mistresses and fellow pupils, and they had parted from me with tears. It was good to remember that I had won some affection and scattered seeds of kindness by the way-side of my life. School days ended, I had had a brief sojourn in Paris with a friend; and at last—at last—I was grown up, tolerably accomplished, and, best of all, free as air in heart and mind.

I began to speculate on what I should find at the end of my journey—if all would be strange, or would come back to me as well known and familiar. To aunt, who had received my mother when a bride—who had stood beside my dying father—my heart was drawn strongly.

My other aunt had died when I was at school; she had married a Mr. Hays, who, by my father's desire, had assumed the family name.

The sisters had met but seldom after the marriage, Barbara having deserted our quiet country for gaiety and society elsewhere. She had left one daughter, Edith, the cousin whom I had never seen yet; and Mr. Hays had married again very soon after the death of his first wife. In the kind letters aunt Dorothy had written me she told me that Edith and her father's new wife did not agree, through whose fault it was she did not know; and this was almost all that I knew of my cousin, Miss Edith Lovel-Hays.

There was one face which I longed to see—the face of my little playmate and kinsman, Brandon. Little he would be no longer, as he was older than myself; and must be greatly changed. He had been frequently mentioned in aunt's letters; Brandon, she told me, had been brought home from school long ere, in her eyes, his education could be properly begun; but he was more like a man than a boy. Then, Brandon's father had died very suddenly; and the child is like you, Kate, an orphan; though in calling him child I err, for he is a young man, already master in the house. I don't wonder at this, for his father was a merely nominal master; and, but for Brandon, I verily believe the property would have been lost.

What Mr. Brandon Lovel's relationship to myself or family was I did not know, nor, I am sure, did aunt Dorothy; he was not brother or cousin, and I suspect his relationship to us consisted in the fact of his bearing the same name and belonging to the same county

as we did; he and his predecessors were our "kinsman;" a sufficiently vague description.

Brandon's mother had died whilst he was an infant; and he had been neglected by his father. Knowing something of the gentleman's character, aunt's remark, that the property might have been lost, did not seem to me without grounds. Mr. Lovel was supposed to have sown whole acres of wild oats; his name and the names of his bosom friends were synonymous with wildness and folly, and he had gloried in this.

Brandon's life, thus far, could not have been happy: and it was not strange that he was grave and quiet; the wonder to me was that he had not followed the example of those who surrounded his father, but he seemed to have shrunk away from the atmosphere of dissipation to the quiet, sanctuary of his study and the loved companionship of his books.

As my playmate, the man's nature had been visible in the child's—for then, as now, he was a student. His greatest delight had been to lie before the old-fashioned fireplaces, finding out the meaning of the pictures on the tiles, and relating stories to me, whilst aunt Dorothy smiled on us.

Kingston and the Brandon estate was not very far from our own, which, in extent and wealth, sank into insignificance beside the other. Perhaps we had a little more pedigree and bygone glory than had the Brandon-Lovels.

I was near Stanton now—there was the spire of its church. I could picture the quaint building, the stained windows, the low porch, the green hedge and creaking gate. I looked out at the little station with its white railings, and beheld a rosy-faced groom clad in the livory of the Lovels. Ere many moments I was standing on the platform, rather faint after my long journey, my heart beating fast; but as there was no reason why I should burst into tears on being plunged at by the groom, I drove them back, soon recovering my habitual calmness, and descended the steps, followed by my luggage.

The air, as we drove along was cool and sweet. I gazed at white cottages, farms, fields and pastures; then came green trees, with a gleam of water beyond their shadowy clusters, until I saw my home. There was the dear old house, gray and worn; the velvet lawn, with peacocks strutting on it as of old; the garden filled with red roses, clove-pinks, and lavender—sweet old-fashioned blossoms, in which aunt delighted.

The door was open, one or two of the servants waiting; but I replied hurriedly to their welcomes, having caught sight of her dear face, and I hastened to greet her.

She would scarcely let me say a word until I had gone to my room and refreshed myself after the journey; and I ran up stairs, feeling that this indeed was home. I had guessed that aunt Dorothy would give me my own old room, and I could have remained examining the treasures in it, musing on the past for hours; but aunt was waiting, and I left the room. As I crossed the hall and saw the armorial bearings on the high stained window, a vision of my mother standing there, with the colors tinting her dress—of my father beside her—rose before my eyes and seemed to me like a welcome home.

Aunt Dorothy's parlor was a queer little room, with queer little ornaments—Queen Anne teapots, eggshell cups and porcelain dogs; a Dresden vase of rose leaves; a basket of lilies; and drawn near the window was a round table with a spotless cloth; purple-blue and gold china; whilst as the principal figure in the picture was a tall old lady, whose white hair was veiled by a high cap, whose eyes were soft and gentle, and whose delicate hands were half hidden by matchless lace. Such was aunt Dorothy.

"I am surprised, Kate," she said, her hands hovering over the teacups; "I expected that you would still be a school-girl, but like Brandon, you are old—in manner, I mean, You are very like your father; the same dark hair and eyes, the same frank expression; but all we Lovels are 'frank and fearless.' We shall be very happy, I think. Your mother, Edward and myself never had an angry word, though people say pride and hot temper are our family failings."

I glanced for a moment at the face of him whom I had known all too slightly, who had not lived to bid his child welcome; opposite was my mother's pure face; her image, too, was faint and indistinct.

"They were very fond of each other," said aunt. "Her room up stairs is just as she left it, Kate, for Edward would not have it disturbed; he did not long survive her; duty called him away and when he returned, it was only to die. We shall never see another like him, for the world and its ways are changed now, and what its future will be I know not. That other picture represents myself and Barbara. You don't remember her?"

Only once or twice had I seen her.

"She had some slight difference with Edward, and did not care for Stanton. Mr. Hays is living, as you know, but we see nothing of him."

Her hands trembled a little, and I thought of her love-story; she did not allude to it, for she was one who never spoke unkindly of the living, and would have thought it a sin to speak of the dead save roverently and tenderly.

"Edith is very like her father in some things; but she resembles Barbara very much indeed. You will see her to-morrow."

"To-morrow? I echoed.

"Yes. She comes here when she pleases. It will be more pleasant for her now that you are here, for it was dull, I'm afraid, for her. She is so like her mother!"

From this I began to form my own opinion of Miss Edith Lovel's character.

"I hope you won't be dull, Kate. There is but little society; Brandon comes, and sometimes Nevil Verner."

"Nevil Verner, aunt?"

"Ah! the Verners are strange to you, dear. They came to live at Newville, and, discovering that Mrs. Verner was an old friend of mine, I called to see her. I found her a confirmed invalid; she is a widow, Nevil her only son. As I am too old to go so far often, and she cannot come, we correspond very pleasantly through Nevil. He brings messages from her, and carries back mine. Edith and he did not agree, which was a pity, as he is so kind. I have much to be thankful for, though you would smile, perhaps, if you saw me, with Nevil reading for me or giving me the latest news."

I was not a little touched by her simple pride in this; and a feeling of gratitude towards the unknown Nevil Verner awoke in my heart.

"He took your portrait to show Mrs. Verner, Kate. You see I have my friends; best of all, I have Brandon."

Involuntarily I glanced at the blue and white tiles, and aunt Dorothy smiled.

"He is my right hand, Kate. He often talks about you, and calls this his other home. He gives me his arm round the garden, reads to me for hours, and always sends me something on my birthday. It is something for one so old to say that her birthday has never been forgotten. Though the world has sadly degenerated, the good and true still remain. King's Rest is lonely for him, I fear; but he and Nevil are good friends."

"And Edith?"

"Edith and Brandon are excellent friends, though she teases him sometimes. He will never marry."

Aunt said this so solemnly, that I looked up, expecting a story.

"You know the prophecy—that one of our houses, in every generation, will remain unmarried, and it has always come true. My uncle Sydney was never married, though his wedding-day was chosen. I am not married; and in the present generation the lot will fall on Brandon."

"It may fall on me, aunt."

"You are the last of the Lovels, for Brandon's family is but a branch; Edith is scarcely a Lovel; the race will not die out, so the lot must fall on Brandon."

"I would like to see Brandon, only I dread meeting him as a stranger."

"You will meet as though you had not parted."

In this strain she continued for some time; then rising, led the way to a second parlor; a new piano, somewhat out of keeping with the old furniture, she told me belonged to Edith.

Long after aunt Dorothy was, I hope, asleep, I wandered through the rooms in the light of a Summer moon: a strange occupation, but it suited my mood. No sound disturbed the silence of night; I gazed out at a sky whose color melted into the tenderest emerald tints where it seemed to touch the earth, and straining my eyes, I fancied I even saw the trees surrounding Kingston; there was peace and repose here, and I laid my head on my pillow, feeling calm and tranquil as the night itself, with no foreshadowing of sleepless hours, of bitter tears, of sorrowful vigils, though they were indeed to be mine.

(To be continued.)

BRIC-A-BRAC.

At Cambridge, General Washington had heard that the colored soldiers were not to be depended upon for sentries. So one night when the pass-word was "Cambridge," he went outside the camp, put on an overcoat, and approached the colored sentinel. "Who goes there?" cried the sentinel. "A friend," replied Washington. "Friend, advance unarmed and give the countersign," said the colored man. "Roxbury." "No, sar!" was the response. "Medford," said Washington. "No, sar!" returned the colored soldier. "Charlestown," said Washington. The colored man immediately exclaimed, "I tell you what, sar, no man go by here 'out he say 'Cambridge.'" Washington said "Cambridge" and went by, and the next day the colored gentleman was relieved of all further necessity for attending to that branch of military duty.

Improving on Shakespeare.—One day as I was coming from the Lyceum, where I had been witnessing Booth's "Hamlet," I got into a car with a rustic young lady and her swain, who had been present at the same performance. "Oh, William," said she, "it was perfectly lovely, but so sad. I think it was an awful shame to drown 'Ophelia' and kill 'Hamlet.' They ought to have been married." The swain heaved a sigh, drew close to his love, and said: "I ain't great on tragedy, but I guess that's how I'd a-fixed it."

How an Arab Poetess was Inspired.—Many very good jokes are found in Arabic poetry, but these also for the most part depend upon some ingenious turn of a word, and are therefore untranslatable. The Arabs were very fond of the exercise of capping each other's rhymes. Akil ibn Ullafeh, a poet of the Koreish, one of whose daughters married the Caliph Yesid II., thus amused himself while on a journey with his son and daughter. When it came to the young lady's turn to improvise a verse she sang as follows:—

"All giddy then with sleep were they,
As though with Sarkhads liquor strong,
That through the veins doth find its way,
And course through back and feet along."

"By Allah!" exclaimed the father, "thou couldst not have described it so unless thou hadst drunk thereof," and proceeded to administer corporal punishment. The son remonstrated by shooting at his father with an arrow. "Never mind," said the old man, quoting a proverb, "his temper is like Akhzam's;" that is to say, "he is a regular chip of the old block."—Temple Bar.

If it be true that one man in twenty-five is color-blind, the cause of a great many heart-burnings and alleged practical jokes has been discovered. There is the color-blind lover who said to his lady-love, who was a brunette, and wore maroon, "Yon dear little strawberry blonde, what a nice green dress you wear; it just becomes your blue hair and yellow eyes." He was merely color-blind.

A chemist, expatiating on the late discoveries in chemical science, observed that snow had been found to possess a considerable degree of heat, whereupon an old lady observed, "that truly chemistry was a valuable science," and, anxious that the discovery might be made profitable, inquired of the professor what number of snow-balls would be sufficient to boil a tea-kettle.

"What kind of a house do you want?" asked the architect. "Oh," replied the citizen, wearily, "I don't want a house at all. I just want you to build me three tiers of closets, like jail cells; one hundred and thirty closets in a tier, and put a roof over the top tier. I want to put up a house that will contain enough closets to satisfy my wife. But the architect, who was a man of broad experience, told him he would have to put a thousand closets in a tier and make the edifice six stories high, and then his wife would say when completed that there wasn't a closet in the house big enough for a cat to turn round in.—Burlington Hawkeye.

Philological Contrarieties.—A gentleman having an appointment with another, who very seldom kept his time, to his great surprise, found him waiting, and thus addressed him—"Why, I see you are here *first at last*; you were always *behind before*, but I am happy to find that you have come *early of late*."

"We had Some Words and Parted."—A reverend gentleman horrified a small company a few evenings ago by telling that he and his wife had separated. "Not parted?" inquiringly exclaimed three or four in a breath. "Yes," said the gentleman, with a sigh; we had some words, and parted." A shudder went round the room, when some one inquired: "For good?"—"Oh, no!" said the divine. "She has only gone to the country, and will be back in a day or two."—"But," said one of the bolder ones, after a while, "Did you really have any words with her?"—"Oh, yes! she said, 'Good-bye, dear;' and so did I."

The Dark Side of Matrimony.—A slave in the West Indies, who had been married to another slave by one of the missionaries, at the end of three weeks brought his wife back to the clergyman, and desired him to take her again. The clergyman asked what was the matter with her?—"Why, massa, she no good. The book says she obey me. She no wash my clothes. She no do what I want her to do." The minister: "But the book says you were to take her for better or for worse."—"Yes, massa, but she all worse and no better. She hab too much worse, and no good at all."

In a murder trial in Nevada a citizen was being questioned as to his qualifications to sit in the jury-box. One query was:—"What would you do if you were on the jury, and the case was," etc. "Sure I'd do whatever was plazin' to the rest of the company," said he. He was excused. The local comment is that this teaches us that politeness is not always to be encouraged.

Village Postmaster to His Wife:—"Here is a postal card to Mr. Jones, saying that his brother and five children will be here on Saturday. Now keep that card back till then and I will be at the depot, and when they find no one to meet them I will take them all over for $3.

The best periodical for ladies to take monthly, and from which they will receive the greatest benefit is Hop Bitters.—*Adv.*

For Women.

CONDUCTED BY MISS RAY CLARK.

FANCY WORK.

CARRIE V. SWEET.

Much has been written in regard to fancy work; and many articles have been wrought from printed instructions that have brightened many an otherwise plainly furnished room. Still much more may be written, even a repetition might be made with no detriment resulting therefrom.

And now as the time for our annual fairs is at hand an agitation of the subject may result in some good. Some one may be incited to contribute a specimen of hand-i-work to the women's special department. This department, possibly not strictly one of the essential ones, is in itself as great an educator to certain classes as the "cattle show" and "horse racing" are to other certain classes. Unbiased people have admitted that a fine display of women's work adds much to a good fair and is in no way detrimental to it.

The taste of most individuals is modified by their surroundings, and whatever is new and pleasing to them has a tendency to soften and refine the coarse side of their natures. These are facts well worth remembering; facts that can be quite fully developed by the general tone of exhibitions at the county fairs. The most of us have probably made some articles for home purposes that "tell their own story" of neatness, industry and ability. If so send them to the fair, allow them to tell the story to five hundred homes some of which will profit thereby. The larger the collection and the greater variety exhibited the better the people will be pleased and the greater the inducement to attend "our fair."

If the ladies of the Rural New-Yorker will set themselves about contributing descriptions of how to make various articles of fancy work they will supply a much needed want in our rural homes. A want that is felt most by those that have the least chance to see such exhibits because of the distance from the city and inconvenience of going to town.

A friend once said some mats would save her best table cloth. Handing her instructions she soon made a complete set of table mats. Another wished some edgings, giving her instructions her busy hands soon made several yards of knit edging. This tends to prove that many an article would be made and exhibited if a little of the right instruction was timely given. Therefore my plea to "Rural" women is to exhibit all such articles at the county fairs.

[Accompanying this article was a drawing for illustration of a figure for outline embroidery, a pattern for applique, one for table mat, another for knit edging. The descriptions for the latter two are given below. The illustrations we are unable to insert—limited time and press of work will not allow of their reproduction. Any one familiar with crochet and knitting work will be able to use the descriptions without illustration in making mats and lace.]

KNIT EDGINGS.

Cast on 5 stitches, knit across plain. 1st row knit 1, throw thread over, knit 2 together throw thread over twice, knit 2. 2d row knit 2, knit 1 loop, purl 1 loop, knit 3. 3d row knit 1, throw thread over, knit 2 together, knit 4. 4th row bind off 2, knit 4.

TABLE MATS.

Use German cotton No. 4. Begin at the center and crochet a chain of several stitches. Turn and crochet back, once into every stitch around to starting place, then turn the work and crochet around again thus forming a rib. At each of the lines widen one, stitch every time round, that is, crochet two stitches in one so as to keep the mat flat and good shape as it grows in size. Crochet as many ribs in each mat as there are center stitches. Hence if you make six stitches in the center chain, crochet six ribs for the mat. In crocheting around each time to starting point observe a little loop in-

to which fasten the work before turning so as to preserve each rib separate and unbroken at this place. The turning is to form the ribs.

The border is simply three rows of common shell crocheting.

To complete the set there should be a mat for meat platter, for gravy boat, vegetable dishes, tea-pot and hot water pitcher. Each mat to vary in size to suit the dish placed upon it.

[The above article was written for our "Fair Edition," but, like other matter, was unavoidably crowded out. As the Fairs are not yet over, it will still be timely, although we regret its non-appearance in former issue.—R. C.]

DRESS.

THERE is nothing in this age and country that yields a more potent influence over people in general, than dress, and for that reason, if no other, should neatness and taste be exercised in the selection and "make up" of our clothing.

Although many go to extremes in dress, there are those who keep the extreme in an opposite direction. Not that they don't wear enough clothing, but they are so fearful lest some one should think they are trying to "keep in the fashion," that they make of themselves oddities and subjects of ridicule. There is no necessity for following every whim of fashion; neither is there any excuse for a person persisting in having his or her clothes cut "just so," and being of just such a quality for all occasions, regardless of their ill-fit or unbecomingness.

I have seen mothers with grown-up daughters who were refined ladies, persist in dressing in a style that attracted attention and ridicule, and was a source of mortification to the daughters. And such people are often quick to accuse their children of being ashamed of them.

We all love to see the dear old lady, who, in spite of being old-fashioned, is neatly and becomingly attired. It is better to wear a fresh, neat handkerchief around one's neck than cheap, coarse lace, or a soiled, crumpled ruche, because lace or ruching is fashionable.

There is a great tendency with the younger people to ape every fashion, without regard to expense, good taste, or becomingness; this is greatly to be deplored, as it is apt to make a strong impression, either favorable or unfavorable. How important it is that one should be careful, tasty and neat in the arrangement of the toilet. It matters not if one is poor and cannot afford to buy expensive clothing, keep the coat or dress carefully brushed and repaired, and if a woman, don't put a lot of trimming on a cheap dress, that will attract attention to its cheapness. The more severely plain the better, taking care that it fits well, and is of some quiet, modest color.

It is to be wondered at that some mothers think it necessary to make their little girls' dresses so short; when they sit down, the little things vainly endeavor to pull their scant skirts down over their knees, and when they run or jump around in their play, one has a full view of their underclothing, to the belt.

We hear a good deal of ridicule of women's dress from the masculines; one tells us how absurdly long or short some women wear their dresses; another points out the bad taste of some fleshy or thin woman in the fit or style of her garments. But did it ever occur to any of my sisters how equally absurd some men dress?

Walking through one of the fashionable thoroughfares of the city, not long ago, I could not but observe some of the masculine costumes. About nine-tenths of all the men I met wore pantaloons that touched the pavement behind with every step, and in many cases they were frayed and soiled, just as some women's dresses are. A very few that I met wore pantaloons that were really quite short, and caused their feet to look just as large and clumsy as some women's do, with short dresses on.

I observed quite a number who were rather fleshy, and they invariably wore pantaloons that were "skin-tight," with exceedingly short coats that did not add to their appearance from a rear view; these were open in front, displaying a huge watch chain dangling on the expansive vest-front. Surmounting this was a high "stove-pipe hat," than which a more absurd hat was never worn by a woman.

Another class was exceedingly thin, and invariably wore pantaloons—one leg of which contained cloth enough to comfortably cover both legs of the wearer, and they wore, as a rule, ulster or long overcoats that were open from a little below the belt behind, causing the coat-tails to flap around equally as ungracefully as a woman's illy-draped or tight skirts. And then, how their shoulders were padded! One has to smile, to see the arm moving from the real shoulder so far back under the pad, and imagine the kind of a figure there is hidden under all that cloth and padding. With this costume is worn a large Derby hat, and the hair is cut so short that the scalp shines through, and the ears stand out, with a strong resemblance to a—well, what the little girl called—"a long-eared horse."

For another class I refer you to a humorous cut on the last page of a late RURAL:

"Fact,"

"Solomon in all his glory was not arrayed as one of these."

ALLINE RAY.

A POOR TRAVELING DRESS.

WHAT would one think of a mother who provided for her daughter's traveling outfit, over a very long, rough journey, where she was to meet all vicissitudes of climate and weather, only a flimsy ball dress? It might be very beautiful in fabric, and adorned with abundance of the choicest flowers and sparkling gems, but it would be a miserable failure as a traveling dress, and we should almost think the woman deficient in sound sense who should provide it for such a purpose.

But is it any more sensible to send our girls out over the rough journey of life with only a stock of accomplishments to meet the wants of this every-day working world? How many dear girls marry without the slightest preparation in the way of domestic knowledge and self-reliance in managing home affairs. It is fondly hoped that skill will come to them and that they will manage somehow to keep a house in respectability and comfort; but O that ball-dress traveling suit! How poorly it answers in the wear and tear of the road.

Don't buy everything for the girls. Trust them with the money after giving them as much good advice as you please. Let them learn how to buy by actual experience. If they make some mistakes let them abide by them just as you have to. Said a boy of a brother skater who had met with a tumble: "Let him fall down. That's the way to learn." It is the way we all learn a great many things. If Jenny's pretty blue cambric fades out white, let her bleach it and make the best of it; but learn the lesson also of avoiding that alluring, deceitful shade in the future.

Let her learn to make bread from the beginning to the end of the process, and teach her the most thrifty, excellent short-cuts to perfection in all departments of cookery.

It is not needful to go through the tedious processes our grandmothers used to beating eggs to a froth with a knife, waiting all day for bread to rise, and so on, in a world where egg beaters are to be had, and Vienna yeast-cakes which will answer the purpose of rising in an hour or two.

Let her eschew cream-of-tartar and soda when good baking powder is to be had, and adopt all similar improvements. Life and time are too precious to be needlessly wasted on these old-time crudities. Housekeeping need not and should not be half so hard to the girls at the present time as it was for us, if they only will take hold and fit themselves for the business before actually in the whirl of it. What merchant would send out a ship under a captain who knew nothing of navigation? Would not there be likely to come disaster and distress enough in such a case? Should not the home pilot be equally qualified? OLIVE.

THE FUND FOR MRS. GARFIELD.

MARY WAGER-FISHER..

THE gift of a quarter of a million of dollars to Mrs. Garfield is one of those spontaneous movements of a people as beautiful as it is generous, and has its value and significance in its spontaneity. Every such national movement tends to allay factional strife and to cement, strengthen and sweeten national union, while in this instance it at the same time forms an avenue for popular expression of admiration and love for a brave little woman whose heroic behavior during a time of intense time has elicited the highest praise from all the civilized world. The objections raised by some parties (there are people who always object to everything noble and generous) to the inexpediency or inappropriateness of making this gift to Mrs. Garfield, except in case of the death of the president, possess nothing justly tenable. Mrs. Garfield, ever since the nomination of her husband to the presidency, and especially since his election, has been constrained by force of circumstances to give her time and her strength to the public, and such was the demand made upon her, that for weeks she hovered, on the verge of the grave, brought there by the tremendous strain upon her nervous system, aggravated by the unwholesome sanitary environments of the executive mansion. Then came the terrible second of July! The President's life hung on so slender a thread, that a million breaths were bated for fear that precious hold would break. Everything seemed to depend upon how the loving wife would take it. The wounded sovereign was harrowed with anxiety, until hour after hour sped by, and at last she came, still weak from her long illness, but strong in her woman's faith. With quiet manner and tearless eyes, she entered the president's room, and when she emerged with pallid but calm face she had spoken the healing word "LIVE." "*He will live*" she said, and through all the trying hours and days that have followed, her glowing faith has never seemed to waver. It has given the president what no surgical skill could give, and its continual ministration is beyond the remedial power of all medicines. It was that rare and thrilling spectacle of a woman made great by suffering and answering with unflinching heroism to the demands of a supreme moment. All honor to her, she richly merits all that the people have in their hearts to give her. And if the President lives—as all true hearts pray he may, regardless of political bias, will not the nation owe—under the providence of the great Giver of Life—the saving of its most precious life to the heroism of Lucretia Garfield?

FASHIONS.

Young children are wearing indoors shoes of untanned leather.

Shirring is the leading feature in the making of dresses.

Ladies new dressing-mirrors, framed in plush, painted by hand, have the following appropriate quotation:

Plush covers for small tables are made up of small scraps of several shades, each with its own or a fanciful edge embroidered upon it.

Evening shawls in rich colors come so cheap this year that there seems to be no excuse for wearing knit breakfast shawls.

Pocket-handkerchiefs for day use have a narrow hem of porcelain or of dark red, and sometimes the entire center is in small blocks of ecru with white.

A fancy prevailing to some extent in bracelets is to wear one set with a stone corresponding to the month. A bracelet for January has a garnet; one worn in February, an amethyst; March, has jasper; April, sapphire; May, agate; June, emerald; July, onyx; August, carnelian; September, chrysolite; October, aquamarine; November, topaz; December, ruby.

MRS. MYRA BRADWELL, the editor of the Chicago *Legal News*, demonstrates what a quick-witted, energetic woman can accomplish in business. Not only does she edit and publish one of the most valuable and successful periodicals devoted to the interests of the legal fraternity, but as soon as the Illinois Legislature adjourns, she goes to Springfield personally, and makes a careful copy of all the enactments of the session, and publishes them in a well-bound volume. She has done this at the close of the last four sessions of the Illinois Legislature. The Legislature could not do a handsomer thing than to authorize Mrs. Bradwell to print the laws officially hereafter, and pay her the money for so doing, which is now paid to others for doing the same work much later and not more perfectly than she does it.—Woman's Journal.

THE corner stone of the new building of Lasell Seminary, Auburndale, Mass., was laid June 9, with a poem by Florence, daughter of Louise Chandler Moulton.

CORRESPONDENTS' CORNER.

IN reply to inquirer for information in regard to silk worms we say: That we do not recall or find by referring to several previous issues any description, but the one by Mary Wager-Fisher in April 2nd number. Address as there stated, Women's Silk Culture Association, 1,328 Chestnut St., Philadelphia, Pa. By sending a three-cent postage stamp your communication will be recognized and we hope to your benefit.

How can I succeed in removing warts from my hands? Having tried remedies unsuccessfully. B. A. R.

ANS.—The best remedy that we know of is to touch them with caustic; this, of course produces an unsightly black spot but it is preferable to endure this for a short time than to suffer the coustant annoyances occasioned by these excrescences.

WILL you please tell me where I can get the best and finest steel needles for hand and sewing machine-work. A. S.

For hand sewing the "Milward" needles are a good make, and probably the best that can be obtained at any first-class fancy goods store. Sewing machine needles are for sale at all machine stores, and are often to be found in dry or fancy goods stores. The nearest city or town will no doubt have what you require.

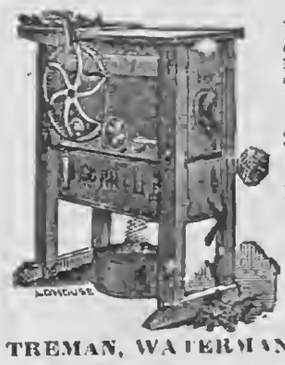
Mothers with sickly, fretful, nursing children, will cure the child and benefit themselves by taking Hop Bitters daily.—*Adv.*

Miscellaneous.

PROFESSOR HORSFORD'S PHOSPHATIC BAKING POWDER

Made from Professor Horsford's Acid Phosphate.
Recommended by leading physicians.
Makes lighter biscuit, cakes, etc., and is healthier than ordinary Baking Powder.
In cans. Sold at a reasonable price.
The Horsford Almanac and Cook Book sent free.
Rumford Chemical Works, Providence, R. I.

Improved Cornell Corn Sheller..



FOR 1881.
Will shell *more* corn with *less labor* than any other machine in market.
The only Sheller made
THAT USES
Spiral Springs for the Pressure Bar,
Every Machine Warranted to do as good work
As any Sheller Made
☞ Ask to see the Cornell Sheller, try it and you will buy no other.
Address orders to
TREMAN, WATERMAN & Co., Ithaca, N. Y.

Cider and Wine Mills.
We make the best and cheapest
Cider & Wine MILL
In the market. Also Cider Press Screws. Send for prices.
RUMSEY & CO.
Seneca Falls, N. Y.

FARMERS and OTHERS
With a spring or running water on their premises, can have an unfailing supply at any point by using a Hydraulic Ram. More than 800 different styles of **Lift and Force Pumps, Hydraulic Rams, etc.**
Send for circulars and prices.

News of the Week.

HOME NEWS.

MONDAY, Sep. 5, 1881.

The President's condition is still exceedingly critical. Since our last news concerning him, August 27, he has been "at death's door" several times; but hitherto good nursing, medical attention and a splendid constitution have kept him from crossing the threshold. For nearly two months he has been able to take but very little nourishment and he is therefore extremely feeble and emaciated—so much so that his greatest danger is from death by exhaustion—starvation. Even before the attack on him, his digestive organs frequently troubled him and of late he has had to be supported for days by injections of beef tea, etc., the stomach refusing to bear any food. The original wound appears to be healing moderately well, but the wound caused by the glandular trouble in the neck is still very annoying and dangerous. Matter is discharged from this outward through an incision in the neck and through two openings in the cheek, and inward through an opening near the top of the gullet. Moreover, he is said to be suffering from malaria due to the miasma arising from Potomac flats just back of the White House. On this account the doctors think that the only chance for life depends on his removal, and it has been decided to take him to Long Branch. If his condition is good enough, the transfer will be made to-morrow, but this morning's telegrams say he was a trifle worse yesterday than the day before.

A disaster only a trifle less than the Custer massacre, is reported to have befallen our troops near Fort Apache, Arizona, where Gen. Carr and two companies of cavalry, numbering about 78 men, are reported to have been ambushed and killed by the White Mountain Apache Indians. Gen. Carr, with the two cavalry companies left the fort to arrest a turbulent "medicine man." Lieut. Cruse tried to make the arrest and was shot dead by the medicine man's brother. The enlisted Indian scouts who were close to the troops, at once poured in their fire upon them, killing most of the officers and a great many men. Then all the Indians began to massacre the survivors, only two of whom are said to have escaped to Fort Apache. This place, containing a handful of infantry and the women and children, was at once fiercely attacked by the savages, but by the last accounts they had been gallantly repulsed with a loss of seven or eight men killed among the besieged. Troops are being hurried forward as rapidly as possible from all the neighboring country. Another Indian war seems inevitable.

Preparations are being rapidly pushed ahead for the great international Cotton Exposition at Atlanta. It will well repay manufacturers to make a grand display there and pay visitors well to go and see that display as well the ten thousand and one others.

At Galveston, Tex., a general strike occurred, Thursday, of 'longshoremen, car drivers and laborers at the oil mills, cotton pickers, etc. The demands of the 'longshoremen were alone acceded to. Large crowds prevented the attempts to run the street cars.

Preparations for the centennial celebration at Yorktown, Va., are rapidly progressing. The ill-health of the President and the inadequacy of the Congressional appropriation of $20,000 toward the expenses of the undertaking had at first a depressing effect; but activity and interest have increased and the display will doubtless be very fine. More than 25,000 troops and 5,000 Masons will be under tents there and a vast concourse of visitors is expected.

A committee has been appointed to gather contributions for the relief of sufferers by the tornado that lately destroyed New Ulm, Minn. Mr. Ed. Uhl, Sec., *Staats Zeitung* office, this city, will receive any contributions our readers may like to make.

Henry G. Vennor, on Wednesday last, Aug. 31, writes: "Cooler weather by Saturday and Sunday, with probably frosts in New York State. Some heavy rain-storms during the early part of the week following."

Sitting Bull and his 200 followers are soon to be removed to Fort Randall, at the mouth of the Niobara River, above Yankton, where they will be held as prisoners of war and not as pensioners of the Interior Department.

The value of the taxable property in the State of Michigan has been fixed by the Board of Equalization at $810,000,000.

The assessed valuation of the Territory of Dakota, not including railroad property, is $30,000,000, an increase of 50 per cent. in one year.

Nothing better illustrates the remarkable prosperity of this country than the stupendous increase in the ratio of railroad mileage. In 1879 there were 2,777 miles of new road constructed—a very respectable amount; but in 1880 the number of miles completed rose to 7,174.

W. P. Andrus of Detroit, Mich., an ex-State Senator, became insane from a wound received during the war, and while being taken to the asylum, recently, escaped and has not been heard of since.

A meeting of the joint committee representing the Yorktown Centennial Commission and the citizens of Washington and Baltimore was held recently and it was decided to entertain the guests of the occasion in Baltimore on October 10, 11 and 12, and in Washington on October 13, 14 and 15. It is expected that there will be twenty guests from the French government, and that France will send over one or two of her large war vessels with troops. They will arrive about the 5th of October.

An encampment reunion of the soldiers and sailors of the Northwest is to be held at Lafayette, Ind., on the 21st, 22d and 23d of September next. The exercises will consist of regimental reunions, the organization of detachments, "stragglers," drills and reviews of the posts of the Grand Army of the Republic, prize drills, dress parades, camp-fire chats and songs, a sham battle, addresses, etc.

"Could Not Have Lived a Year Longer."

A clergymen in Mississippi says in a recent letter: "I feel so much improved in health that I think it my duty to inform you of the great benefit your Compound Oxygen has been to me. *I was very low and suffering greatly. I could not have lived a year longer without receiving relief in some quarter.* I am now going about my ministerial duties, and last Sabbath, while officiating at a funeral, a storm overtook me, and I was drenched in rain; but no serious consequences followed, as I had reason to expect from past experience." Our Treatise on Compound Oxygen, containing large reports of cases and full information *sent free*. DRS. STARKEY & PALEN, 1109 and 1111 Girard St., Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

THE Society for the Promotion of Agricultural Science, which lately held a meeting in Cincinnati, consists as yet of only 22 members and the rules for the admission of new ones are very strict. Among its present members are most of the notable men in the country connected with agricultural science, including Professors S. W. Johnson, W. J. Beal, L. B. Arnold, C. V. Riley, James Law, Hilgard, Brewer, Farlow, etc.....The following officers of the N. Y. Farmers' Alliance were elected for the ensuing year at the annual meeting held at Watertown, on Aug. 24: Pres., A. S. Deven, Elmira; Treas., Lyman Crowell, Seneca Falls; Sec., W. J. Fowler, Henrietta; Executive Com., J. C. Shepherd, Harris Lewis, W. G. Wayne. The next annual meeting will be held next year at Utica, on the fourth Wednesday of August.....Among the many estimates of the cotton crop this year one of the best supported is that owing to unfavorable weather it will be half a million bales less than last year's crop, making only 5,800,000 bales. This is about a million less than good estimates early in the season.....It is estimated that there is ten times as much fencing in Illinois as in the whole of Germany—far too much in Ill.....Corn three years old is coming into the Chicago market. There is nothing like high prices to bring out long hidden supplies.....There are 4,348,301 bushels more grain in store in Chicago than there was a year ago. The increase is mainly in wheat and oats.....The cotton presses of New Orleans, which usually open on the first day of September, are confronted by a demand of 13,000 laborers for an advance of 25 cents per bale in handling. The cotton factors have raised $250,000 to maintain the old rates, and are hunting laborers in all the Southern States.....The Mark Lane Express, of Aug. 29, in its review of the grain trade for the past week, says; "The past week brought general disaster and ruin to the harvest. A series of intermittent storms culminated Thursday in a general thunder storm with a deluging rainfall. To adequately estimate the damage we must remember that the downpour of rain was on the sheaves which had been repeatedly wetted and dried, or on standing grain, which is literally eaten up by mildew. In flooded districts the disaster is complete. Unthatched ricks have everywhere suffered from Thursday's deluge. The position of the harvest has materially affected trade, and rates improved one shilling Wednesday and a further shilling Friday. The advance, which would have amounted to several shillings had Thursday's weather continued, was checked by Friday's sunshine. The advance in the provinces was one shilling beyond that in London. Of the few samples of the new crop offering nearly all had sprouted. Early parcels are the best. Foreign wheat is 2s, and flour 1s. to 1s. 6d. better. The English markets are very bare of foreign flour. The supply of native grain in provincial markets is almost out. Port markets are therefore greatly strained. Stocks on both sides of the Atlantic being in strong hands, the supply here cannot exceed the demand until growers in America forward the new crop in sufficient bulk to overpower Atlantic speculators."....,The flaxseed crop for the current year is estimated at 7,500,000 bushels, against 8,750,000 bushels in 1880. The thrashing shows a yield of from four to eight bushels per acre, where ten to twelve bushels were anticipated before harvest.....The New York Grape-Sugar Company has been incorporated by ex-Senator Thomas C. Platt and others, and will have a capital of $1,000,000. It will have a branch establishment at Des Moines, Ia.....During the last fifteen years of slavery the South raised 46,675,591 bales of cotton. During the first fifteen years of freedom, that is, from 1865 to 1880, the number of bales produced was 56,438,335.....The following table, compiled from the most trusthworthy British sources, shows the area under the named crops in the years mentioned.

	—Acreage sown in Great Britain.—			
	Wheat, acres.	Barley, acres.	Oats, acres.	Potatoes. acres.
1872	3,571,894	2,385,783	2,715,707	627,691
1875	3,342,481	2,589,701	2,661,009	522,653
1876	2,905,957	2,543,109	2,798,430	502,719
1877	3,168,510	2,117,588	2,754,179	512,471
1878	3,218,417	2,469,052	2,698,907	508,431
1879	2,800,244	2,667,176	2,656,628	511,314
1880	2,909,238	2,467,141	2,796,905	550,932
1881	2,806,057	2,442,405	2,901,135	579,431

These figures do not include Ireland, but then Ireland is scarcely a wheat growing country. .....The Buffalo Commercial Advertiser says that the eastward movement of flour and grain from the West through that city for the month of August; 1881, shows a decrease of 51,126 barrels in the receipts of flour, and a decrease of 4,951,458 bushels in the receipts of grain, estimating flour as wheat, as compared with the same month last year.....All over the Northwest, and as far South as Southern Illinois, the drought was broken up on the night of Aug. 31. Heavy rainfalls greatly benefited corn where the crop had not been injured beyond recovery. At Springfield, Ill., over three inches of rain fell in less than an hour. At Des Moines, Ia., 2¼ inches fell in three hours, and everywhere heard from the rain was quite heavy enough to soak the parched earth.....Severe forest fires are reported from Ottawa, Canada; Olean, N. Y.; Milford, Pa.; Halifax, Nova Scotia, Northern Michigan, and quite a large number of places in Ontario, Canada. Immense losses of timber, fencing and farm crops are announced. .....A Dairymen's Protective Association, composed of the dairymen of Northern Illinois, and of Wisconsin, was formed at Milwaukee on August 26: President, Hon. Hiram Smith, Sheboygan Falls; Secretary, C. P. Crossfield, Fort Atkinson. Its object is to contest the claims to royalty on cheese hoops, bandages and fillers made by J. Hubbell, of this State, and his backers.....The enormous pork-packing establishment known as Ricker's, but run by J. C. Wately, at Chicago, was burned on August 26; loss on ments and buildings between $750,000 and $1,000,000.....In the anti-barbed-wire-monopoly contest now raging at the West, Jacob Haish, who was contesting Washburn, Moen & Co.'s patent in Illinois, has yielded to the monopoly and withdrawn his appeal before the United States Supreme Court. In 1870 the Court decreed that, pending his appeal, he must deposit with it a royalty of three-fourths of a cent a pound for all the fence he should make till the case should be decided. This amounts now to about $250,000, and it is alleged that he gains this sum by "caving in," as Washburn & Co., do not ask for back royalty from those who yield. The Iowa Farmers' Protective Association is still resolved to fight the monopoly, and their case will be argued next October.

Mr. W. H. Wilkinson, of Holyoke, Mass., has nearly completed 11 silos in a row, each 12 by 15 feet "square," and 24 feet deep. Ten of them will hold 90 tons apiece, and the eleventh, 100 tons, making, in all, 1,000 tons of ensilage—as it is intended to fill all "chock-full." "Saur-kraut," is said to be especially well relished by Dutch cattle; probably W. H. W. intends to invest heavily in that fine breed.

The rail freights on Grain from Chicago to New York are now two dollars per ton of 2,000 lbs. The freight by water via the Lakes and the Erie Canal and Hudson River from Chicago to New York, are now $2.92 to $3.00 per ton of 2,000 lbs. The rail rates are about one dollar per ton less than the rates by water.

Prof. Horsford's Baking Powder.

F. H. Atkins, A. A. Surgeon U. S. Army, says: "In this Powder an acid phosphate of lime takes the place of cream tartar or alum, and while the whitest and most delectable biscuit can be made with it that I have ever seen or tasted, it furnishes a food rich in phosphates, so much needed in animal economy and so largely discarded in our finely sifted flour. Prof. Horsford's high reputation is adequate surety for the absence of alum or any other deleterious or make-weight ingredient."

Don't Wait.

Sediment or mucus in the urine is a sure indication of disease. Take Kidney-Wort and be cured before it is too late. It is always effectual and has cured thousands. Druggists sell both the dry and liquid.

Write to Mrs. Lydia E. Pinkham, No. 233 Western Avenue, Lynn, Mass., for names of ladies that have been restored to perfect health by the use of her Vegetable Compound. It is a positive cure for the most stubborn cases of female weakness.

Thousands die annually from some form of kidney disease, that might have been prevented by a timely use of Hop Bitters.

The People's World-wide Verdict.

BURNETT'S COCOAINE has been sold in every civilized country, and the public have rendered the verdict that it is the cheapest and best Hair Dressing in the world.

BURNETT'S FLAVORING EXTRACTS are invariably acknowledged the purest and the best.

The Markets.

CROPS AND MARKETS.

MONDAY, Sept. 5.—The following were the prices of cereals, etc., in the New York market last Saturday and at the corresponding date last year.

		1881	1880
Wheat.	No. 1 White	$1.41½	1.08¼
"	No. 2 Red	1.44	1.08
Corn.	No. 2 "	.70¾	.51½
Oats.	No. 1 White	.51	.41
Rye.	"	.88	1.08
Cotton.	Low Middling	.11 13-16	.11 7-16
and other grades proportionately.			
Mess Pork		$18.75	$15.75

Earlier in the week the prices were still higher, for on Friday evening there was a fall of 1½a2½c. per bushel on Winter wheat, and from 5a9½c. on all Spring grades. Corn also declined ½a1c. per bushel; while rye, which stood at an advance on Thursday of from 4a6c., also dropped on Friday, the speculative need having been provided for: oats alone went up 1½a3c. a bushel. "Options," too, fell from ½a1c. on the favorite grades of grain. Flour rose during the week from 10 to 15c. per barrel, and feed advanced materially on a very limited offering and a good demand. Seeds, too, were quoted dearer, and 85,500 bushels of flax were sold within a range of $1.40a1.50, closing at $1.45 bid, per bushel.

The notable glut of grain at Baltimore and the accumulation of grain at the seaboard were the chief causes of the decline in cereals towards the end of the week. The following table shows the receipts of breadstuffs at the seven ports on the Atlantic seaboard:—

	Past week.	Preceding week.	Corresp'g week 1880.
Flour, barrels	226,650	236,800	258,400
Wheat, bushels	3,410,250	2,654,700	4,951,800
Corn, "	1,485,800	1,702,450	2,022,200
Rye, "	8,800	8,500	229,200
Barley, "	.....	1,725	1,000
Oats, "	686,100	957,100	481,600

Thus it is seen that although the receipts have largely increased since last week, yet they aggregate much less than those of the corresponding week last year. Moreover, the exports were less than those of either the week before or the corresponding week in 1880, as will be seen by the following table:—

EXPORTS OF BREADSTUFFS FROM THE ATLANTIC PORTS TO

	—The United Kingdom—		
	Flour, barrels.	Wheat, bushels.	Corn, bushels.
Past week	85,350	1,948,700	591,100
Preceding week	103,000	1,213,000	1,175,600
Two weeks ago	10,950	855,900	1,299,400
	—The Continent—		
	Flour, barrels.	Wheat, bushels.	Corn, bushels.
Past week	2,300	988,800	249,000
Preceding week	3,600	1,252,500	259,275
Two weeks ago	5,000	1,662,850	226,100
Grand total to Europe past four weeks	321,900	10,109,700	6,129,800

This accumulation of breadstuffs here is enough to partly account for the fall in prices; but the close of the August deal in cereals here and at Chicago, also had a depressing effect.

From all the information we have been lately accumulating, it appears highly probable that wheat will be considerably higher before the present harvest is all marketed. An esteemed Illinois correspondent who for years has made crop statistics and prices a special study, writes us; "If the drought continues and its killing effects are not soon over, I should not be surprised if wheat, in course of a year, went up to $1.75 and corn to 75c. per bushel." We hardly think wheat will go so high, though corn may; but there is little doubt but wheat will go higher than it is now, and considerably higher, too. The latest reports of the crop from all sections in this country fully confirm our prophecy that the aggregate yield will be about 100,000,000 bushels less than last year's crop. Some think it will be 150,000,000 bushels less, while others still insist it will be about the same—an estimate made by nearly all our contemporaries at the date of our prediction. The latest advices

from Minnesota put the crop of that State at 3,500,000 less than the yield in '80, though five weeks ago it was put at 3,000,000 bushels more. Dalrymple, the great bonanza farmer of Dakota, says his yield was 18 bushels of thrashed grain per acre, against 20 bushels per acre last year——a falling-off of 10 per cent., although a few weeks ago we were assured that his crop and that of Dakota generally would be the heaviest per acre that had ever been obtained. Almost all accounts from the Spring wheat region are of a like nature—nearly all say the crop is fair, but not so good as that of last year.

From present indications the crops in Great Britain have been so terribly damaged or rather ruined, by late heavy rains, that the United Kingdom will need fully as much imported wheat this year as last. French crops are only moderate, and France will be likely to import as much cereals as she exports. Germany and the rest of Europe will have little if any to spare, except Russia. In Russia, however, the crops are unusually fine, and the exports will be much heavier than they have been of late years; how much heavier, however, no one seems to know yet.

From India, Australia and New Zealand the cereal exports are pretty sure to be less this year than last, and they cannot be much heavier from Egypt and Chili. On the whole there appears a certainty that we shall find a high market for all the wheat we can spare.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, Sept. 3.

CHICAGO, Ill.—WHEAT very unsettled and active, and fluctuating rapidly and heavily; No. 2 Red Winter, $1.31; No. 2 Chicago Spring, $1.21a1.23, cash; $1.26⅜a1.26½, October; $128⅝a1.28¾, November; $1.29¾, December; $1.21, all the year; sales, October, as follows: $1.26¾, $1.27¼, $1.26¾, $1.27¼, $1.25⅞, $1.26⅜, $1.25¾, $1.26⅜, $1.26½, and $1.26⅝; sales at $1.19a1.23½, September; $1.27¾a1.29½, November; $1.29a1.31½, December; No. 3 do., $1.16; Rejected, 80a90c. CORN unsettled, at 62c., cash; 63¾a 63⅞c., October; 65⅞c., November; 61⅞c., all the year; Rejected, 58¾c. OATS unsettled at 37c., cash; 36¾c., September; 38½c., October; 39⅝c., November; 36¾c., all the year. RYE easy at $1.03. BARLEY firm at $1.03. PORK fairly active at $18a$18.05, cash; $17.95a18, September; $18.25, October; $18.30a18.35, November; $17.80a17.85, all the year. LARD strong and higher at $11-45, cash; $11.47½, September; $11.62½a11.65, October; $11.75, November; $11.90, December; $11.47½, all the year. BULK-MEATS fairly active and a shade higher; Shoulders, 7¼c.; Short Rib, $9.60; Short Clear, $9.90. SEEDS.—Timothy firm at $2.35a2.65, in store: $2.50, September; $2.50, October. Clover firm at $5.50a6.15. Flax steady at $1.33. BUTTER in fair demand; Creameries, 24a31c.; Dairy, 18a27c.; ladle-packed, 14a17c.; packing, 11½a13c. EGGS in fair demand at 14½a15c. CHEESE firm: full cream, 10½a11¼c.; part skim Cheddar, choice, 9½a10c.; part skim, flat, choice, 10a10½c.; part skim, common to good, 7½a8½c.; low grades, 3a4¼c. HOGS.—Market generally steady; mixed packing, $5.90a6.30; light, $6.30a6.70; choice heavy, $6.50a6.75; culls and grassers, $4.50a6.75; quality good; packers buy freely. CATTLE good, active, and strong; exports, $6.20a6.75; sales, 10 cars at $6.50a 6.75; good to choice shipping, $5.60a6; common to fair, $4a5.50; butchers, $2.25a2.95; stockers and feeders, $2.90a3.90; Texans, $3a 4,12½; half-breeds and natives, $4a4.60. SHEEP.—Market dull, weak and easier; poor to choice, $3.25a4.50.

CINCINNATI.—Wheat active, firm and higher than yesterday; No. 2 Red Winter, $1.37a 1.38. CORN strong; No. 2 mixed 67a67½c. OATS dull; No. 2 mixed, 43½c. RYE quiet at $1.12a1.14. BARLEY quiet; No. 2 Fall held at $1.12. PORK dull and nominal at $20. Lard strong and higher at $11.30. Bulk meats firm and unchanged. Bacon firm: Shoulders, 8¾c.; Clear Rib, 10⅞c.; Clear Sides, 11½c. HOGS quiet; common and light, $4.85a6.70; packing and butcher's $6.25a7. BUTTER—The market quiet, but the supply is not excessive and prices are well sustained. Fancy creamery sells at 30c.; prime do. at 28a29c.; choice dairy at 24c.; prime to choice Western Reserve at 23a24c.; medium do. at 20a21c.; prime to choice Central Ohio at 18a20c.; and common at 14a16c. per lb. CHEESE.—There has been a fair demand most of the week and the market rules stronger for prime to choice factory at 11¾a12c. per lb. HEMP.—There is not much demand, but the supply is light and the market firm. Rough Kentucky sells at $130 per ton from store. Single dressed sells at 8a8¾c. and double do. at 9a10c. per lb. from store. HOPS.—There is a good demand for the new crop of New York seedlings at 28a30c. Old hops are dull at 20a22c. per lb. for prime to choice. SEED.—There has been considerable speculative demand for clover, with liberal sales spot and to arrive at 10c. per lb. Timothy is more freely offered at $2.75 per bushel.

ST. LOUIS, WHEAT, active, but unsettled; broke at the close; No. 2 Red Fall, $1.48, cash; $1.48¼, September; $1.49¼, October; $1.51, November; $1.52¾, December; No. 3 do., $1.39; No. 4 do., $1.29. Corn higher at opening, but declined to 62¾c., cash; 63c., September; 66½c., October; 68c., November; 68½c., December; 75c., May. OATS higher at opening, but declined to 40½c., cash; 42¾c., September; 44c., October. RYE easy at $1.09. BARLEY in good demand. PORK, $19. Bulk-meats-Shoulders, $7.20; Clear Rib, $9.70; Clear Sides, $10. Bacon higher; Shoulders, 8½c., Clear Rib, $10.80a10.87½; Clear Sides, 11½c. LARD firm at $11.40. BUTTER dairy, 20.a28c.; creamery, 28.a33c. EGGS steady at 12.a15c.

HOGS— Light grades lower; Yorkers, $6.30 a6.45; mixed packing, $6.25a6.55; choice to fancy heavy. $6.60a6.85. CATTLE—good demand for shipping grades and good grass Texans; prices firm but supply scant; export Steers would bring $6a6.20; heavy fat Steers, $5.40a6; light do., $4.75a5.30; grass native Steers, $3.50a4.50; native butcher Steers, $3a4; good Cows and Heifers, $3a3.50; common, $2.25a2.75; good grass Texans $3a365; common, $2.25a2.75; stockers and feeders slow. SHEEP—market slow and weak; fair to fancy Muttons, $3a4.40.

At the change of life nothing equals Hop Bitters to allay all troubles incident thereto.—*Adv.*

PRODUCE AND PROVISIONSi

NEW YORK, Saturday, Sept. 3, 1881.

BEANS AND PEAS.—There is a sharp advance in the standard grades of beans. The supply of mediums is very light and a portion of the home trade is forced to use narrows, and the stock is consequently running out faster than was anticipated. A good crop of new is assured if September rains do not interfere with curing. The uncertainty of well-cured early offerings is one reason why certain buyers are now anxious to secure stock. Red kidneys are doing something better. Green peas are quoted steady with small sales.

Marrow beans, prime, $2.60@2.65; other, $2.47@2.55; mediums, prime, $2.70; other, $2.55@2.65; pea, $2.75@3; white kidney, $2.10@2.60; red kidney, $1.50@1.95; black or turtle soup, $1.10.

Receipts of beans for the week, 2,688 bush.
Exports do. 657 pkgs.

BUTTER.—Events are shaping decidedly in favor of the speculative side of the market. Supplies have sold down extremely close, especially for the month of August, and prices have kept in a stiff line—another unusual thing for the period. We do not mean to intimate that there is any new business in a speculative way at prices where they now point; but what is akin to it is the fact that farmers and owners of any lots right in quality are holding on their goods in anticipation of good Fall quotations. The weather is dry and adverse to a liberal Fall yield at many producing places, and farmers report some pretty hard dairying. Receipts are probably smaller than they might be, as harvesting has called off a good deal of attention that could have been directed to shipments. And, then, in the situation of the market, agents are not searching for lots industriously, because, as an old dealer here expresses it, "It's no use to try to negotiate when the dairyman's pleas jump up with the New York market." The demand is mainly for fine creamery, and in several instances dealers have had to piece each other out in supply. Fine dairy goods have had a good call and participate in the high quotations, especially if selected city stored Western butter is reported to have largely fallen to a grade that deprives it of any but a future shipping outlet. The outlook for choice stock has seldom been so encouraging, for in the estimation of many dealers, and they are not noted for willingness to accord farmers the best of a deal, every package of butter sold last month has added to the value of stock in hand in the interior. This, of course, is based upon Fall pasture as being as far beyond recovery as reports now indicate.

Creamery, finest tubs, 30@31c.; good to prime, 26@ 29c.; poor quality, 23@25c.; sweet cream, 28c.; creamery firkins, 24@29c.; State dairy do. 23@26c.; do. half tubs, choice, 27@28c.; do. fair to prime, 25@27c.; Welsh tubs, 21@27c.; poor State, 22@23c.; Western imitation creamery, 19@25c.; dairy, choice, 25c.; other, 15@22c.; factory or ladle-packed June, 19c.; other, 14½@18c.; common Western, 12@13c.

Receipts for the week, 20,070 pkgs.
Exports do. 6,333 do.
Cold storage on steamer to G. B., 908.

CHEESE.—The market was very quiet early in the week, but with light receipts and sudden orders from abroad prices made a turn in sellers' favor and close firm. A good feature is the fact that buyers seem willing to include under-grade stock in their purchases; this has not been the case for several weeks. Western cheese is scarce and not largely inquired for.

State factory, fine colored, 11¾c.; fine white, 11¾c.; good to prime, 10¾@11¾c.; fair to good, 10@10¾c.; poor to fair, 9@10c.; Wisconsin factory, good to prime, 10¾@11¾c.; fair to good, 10@10¾c.; Ohio factory, cheddar, fine, 10½c.; fair to prime, 9½@10c.; flat, fine, mild, 11@ 11½c.; good to prime, 9½@10½c.; fair to good, 9@9½c.; poor, 7½@8½c.; Creamery, partly skimmed, 4@6½c.; fully skimmed, 2½@3c.; full skimmed factory, 2½@3c.

Receipts for the week, 50,350 bxs.
Exports do. 66,622 do.
Liverpool cable, 59s.
Steam to Liverpool, 25@30s.

COTTON.—The market was in the hands of speculators most of August and in the adjustment of optional deliveries for that month prices ran away from all classes of spot purchasers. Spinners and exporters could well afford to wait when prices were 2½c. above September's delivery.

Quotations are based on American standard of classification, and on cotton lustore running in quality not more than half a grade above or below the grade quoted.

	Uplands.	N. Orleans and Gulf.	Texas.
Ordinary	8 13-16	9 1-16	9 1-16

Middling	12¼	12½	12½
Good Middling	12⅜	12⅝	12⅝
Strict good middling	12⅝	13⅛	13⅛
Middling fair	13⅜	13⅞	13⅝
Fair	14⅜	14⅝	14⅝

STAINED.

Good ordinary	7 7-16	Low Middling	10 5-16
Strict good ordinary	8 9-16	Middling	11⅜

Future prices.—September, 11.61c.; October, 11.36c.; November, 11.21c.; December, 11.27c.; January, 11.13c.; February, 11.55c.; March, 11.66c.; April, 11.76c.; May, 11.88c.; June, 11.95c.

DRIED FRUITS.—Beyond noting the fact that a firm feeling prevails in nearly every item there is little to remark. No buyers are out in force; they will be apt to wait until the weather is cool and stocks are more decided in quantity.

Apples, evaporated 1880 rings, choice, 12c.; prime, 11 @11½c.; fair to good, 10½@11c.; N. C. 1881, sliced, fancy, 9@10c.; choice, 8@9c.; Southern, in bbls. 6¾@7c.; do. 1880, in bags, 6¾@7c.; fine cut, choice, 6½c.; quarters, choice, 6¼@6½c.; State, small lots, 6c.; Ohio and Mich. choice, 6@6¼c.; Western, fair to good, 5½@5¾c. Peaches, evaporated, peeled, 35c.; unpeeled, 20c.; N.C. peeled, 1881, choice, 25c.; do. 1880, 21@23c.; peeled, good, 18@20c.; Ga. peeled, 1881, choice, 22@23c.; peeled, 1880, 17@20c.; unpeeled halves, Tenn. 7½@8c.; quarters, do. 7¼@7¾c. Plums, State, 17@18c. Blackberries, 13½@ 14c. Cherries, Southern, dry, 21@22c. Raspberries, 29c. Huckleberries, 12½@13c.

EGGS.—Receipts for the week, 8,478 bbls.; do. last week, 7,852 do. Buyers have been a little shy of stock owing to severe weather of one or two days of the week, and prices most of the time have ruled weak. There is a better feeling at the close and all prime lots sell readily at full rates. Receipts are light and there was no surplus to work down.

Near points, ₰ doz. 22@23c.; State and Penn. 20½@ 21c.; Canadian, 19½@20c.; Western, fresh, 19½c.; other useful grades, 18@19c.

FLOUR.—The market for flour has never before responded so promptly to an advance in wheat as it did during the late excitement in the latter. Buyers seem to feel confident that a high season menaces them. Wheat has eased up in prices, but flour holds its late advance, especially in the desirable grades, of which the offering is scanty. Rye flour is very firm.

No. 2, $4.20@5; State and Western, superfine, $5.20@6; city mills, extra, $7@7.40; Spring wheat, extra, $6@ 6.30; Spring XX@XXX, $6.40@7.50; patents, $7@9; Ohio round hoop shipping, $6.30@6.75; trade brands, $6.85@ 7.25; St. Louis extra, $6.40@6.55; do. double extra, $6.75 @7.15; do. family, $7@7.50; Southern extra shipping, $6.50@6.85; do. XX and family, $7@7.75. Rye flour, $6.00@6.10. Corn-meal, Brandywine, $3.80@3.90; do. Western, $3.25@3.75.

Receipts of flour for the week, 111,876 bbls.
Exports do. 62,302 do.
Receipts of corn-meal for the week, 3,235 do.
Exports do. 3,281 do.

FRESH FRUITS.—Market generally active. Pears favor buyers. Plums scarce.

Apples, Golden Sweet, Western New York, ₱ bbl., 50c.@$1; Gravenstein, $1.75@2.25; Codling, $1.50@1.75; 20 oz., $1.50@2; Malden Blush, $1.75@2.25; Nyack Pippin, $1.75@2.25; Fall Pippin, $1.50@2; Orange Pippin, $1.25@ 1.75; Apples, poor to fair, 75c.@$1.25. Pears, Bartlett, Jersey, ₱ bbl., $1.50@2.50; up river, $3@3.50; Howell, $1.75@2; Flemish Beauty, up river, $1.75@2; Seckle, choice, @$1.50; fair to good, $3.50@4; Cooking, ₱ bbl., $1@1.50. Peaches, up river choice, ₱ basket, $2@2.25; fair to good, $1@1.50; Jersey, extra, $2@2.50; fair to good, $1@1.50; Md. & Del. Crawford, ₱ crate, $2@3; Stump, $1.75@2.25; Culls, ₱ basket, 50c.@60c. Plums, Damson, Southern, ₱ qt., 6c.; Quackenbush, State, ₱ bbl., $6@8; Green Gage, $6@7; Reine Claude, $6.50@7; Egg, $6@7; Blue Gage and Boston Gage, $4; Damson, $1; common plums, $2@3. Grapes, Del., State, case of 24 2lb bxs., $3.50; baskets, ₱ lb, 12c.@14c.; Va. case of 18 2lb boxes, $5; Concord, Va., case of 18 3lb boxes, $3@ 3.25; Del. & Md., ₱ lb, 1c.@3c.; Jersey case of 24 2lb bxs, $2.50@3; Hartford, Jersey, loose, ₱ lb, 2c.@3c.; up river, 2c.@3c. Huckleberries ₱ box, 75c.@$1. Watermelons, Maryland selected, ₱ 100, $15@25; seconds, $12@15; Jersey, Black Spanish, $12@16; Culls, $6@8. Nutmeg Melons, $2@3.50. Nuts—Peanuts are again decidedly higher and held with great confidence. The serious drouth has greatly injured the growing crop in Virginia and a very light yield is anticipated. Pecans steady. Peanuts, Va., hand-picked, ₱ lb, 6½c.@6¾c.; fancy, 6c.@6¼c.; extra prime, 5¾c.@6c.; good to prime, 5¼c.@5½c.; shelled, screened, 5c.@5¾c.; unscreened, 4½c.@5c.; pecan nuts, 8c.@10c.

GRAIN.—Since the settlement of August wheat contracts there has been considerable disposition manifested to realize and the booming tone of a week ago has become quite faint. Exporters have been doing a heavy business under enforced reports of diminished crops abroad, but, although the cable still quotes favorably they now seem inclined to wait for some of the speculative froth to blow off prices and at the moment the form of the market points to an easier buying week. Corn has ruled very strong, a light crop now being one of the settled events. Prices have been supported by both speculation and exportation, though in the latter way trade is not so sharp at the new prices. These quotations have an unlooked for sudden turn and consequently do not obtain the ready response across the Atlantic that attends wheat. The movement in oats is fair one, but prices are well up considering new crop is due. This market has to be in a great degree regulated to suit current wants. Rye shows scarcity both here and at the West. The demand for this grain rather outgrows it production. Barley nominal; a late sale of good Canadian was made at $1 to arrive. Crop reported good.

Wheat, Spring, $1.20@1.69; Spring No. 2, $1.35@1.37; red Winter No. 2, $1.14@1.41½; red Winter, $1.25@1.47; white Western and State, $1.35@1.43. Rye, $1.07@1.12. Oats, white No. 1, 50@51c.; No. 2, 48c.; No. 3, 46@47c.; mixed, No. 1, 43c.; No. 2, 42½@43c.; No. 3, 41@42c. Corn, Western mixed, 69@72c.; No. 2, 70@71½c.; yellow 70@73c.; white, 72@79½c.

Receipts for the week, wheat, 1,750,000 bush.; corn, 642,265 do.; oats, 313,235 do.; rye, 11,181 do.; malt, 72,900 do.; rice, 919 pkgs.

Exports for the week, wheat, 1,199,357 bush.; corn, 315,388 do.; oats, 2,123 do.; rice, 90 pkgs.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes and on Mississippi River:

	1881. Aug. 27. bush.	1880. Aug. 28. bush.	1879. Aug. 30. bush.

Oats	6,917,205	1,591,960	2,492,897
Barley	155,811	235,896	355,222
Rye	348,354	665,741	761,262
Total	15,469,545	36,072,382	32,522,654

Inland freights—The rail freights on grain from Chicago to New York are now two dollars per ton of 2,000 lbs. The freight by water via the lakes and the Erie Canal and Hudson River from Chicago to New York are now $2.92 to $3 ₱ ton of 2,000 lbs. The rail rates are about one dollar per ton less than the rates by water.

HAY AND STRAW.—Exports of hay for the week 3,201 bales; since Jan. 1st, 53,821 do., same time last year, 82,371. There is a demand for prime retailing Timothy at 90c. but few lots are right in quality. Low grades of old hay weak; new does not come in freely, selections of it do as well as old. Straw is lower though prime is scarce.

Prime Timothy hay, ₱ 100 lbs., 85@90c.; fair to good, 55@70c.; shipping qualities, 45@55c.; clover mixed, 50@ 55c.; pure, 40@45c.; long rye straw, old to new, 60@80c.; Short, 50@60c.; oat and wheat, 40@45c.

At the close shipping hay has become quite active.

HOPS.—There has been a very liberal trade in brewers during the past fortnight, and in the urgency to close out the remnant of old stock prices have been put in buyers' favor in some leading instances. New crops will be marketed early as the weather has been forcing, but it is not known if the hurry has been detrimental to quality. The distribution of last year's crop has been about equally divided in foreign markets and home wants.

State Choice, 20@21c.; prime, 18@19c.; poor to good, 12@ 15c.; Eastern, 14@16c.; Wisconsin, 14@20c.; 1879, 12@16c.; olds, 4@10c.; Pacific Coast, new, 19@21c.

Receipts for week, 367 bales.
Exports for the week, 9 do.

MILK.—Plenty of milk arrives, but hot weather and scanty cooling facilities owing to the drought lands much of it sour. Commission cans on the platform, sweet and useful, have sold at $1.35 ₱ 40 qts.

POULTRY AND GAME.—A weak feeling has prevailed in dressed poultry for several days, but with small receipts at the close prices are picking up. Young turkeys quoted 18@20c.

Turkeys, Phila. prime, 15@16c.; State and Western dry-picked, 14@15c.; scalded, 13@14c. Chickens, Phila. 14@16c.; Bucks Co. 14@15c.; Jersey, 12@14c.; State, 12@ 12½c.; Western, 11@12c. Fowls, Phila. dry-picked, 14c.; Bucks Co. 13@13½c.; Jersey, dry-picked, prime, 12½@13c.; scalded, prime, 11@12c. Ducks, Spring, Phila. 15@16c.; Jersey and Bucks Co. 14@15c.; State, 14@15c.; mixed State, 12@13c.; old, fair to good, 11@12c. Squabs white, ₱ doz. $1.75; dark, $1.25.

Supplies of cooped stock are plenty and prices for chickens and fowls are low. Turkeys have sold well, but begin to droop.

Chickens, Jersey, Spring, ₱ lb, 12½@13c.; State and Penn. 12c.; Western, 11@12c.; Southern, 11c. Fowls, Jersey, State and Penn. 11@13c.; Western, 11c.; Southern, 11c. Roosters, old, 5@6c. Turkeys, Jersey and Penn. 13c.; Western, 12@13c. Ducks, Jersey, N. Y. and Penn. ₱ pair, 50@65c.; Western, 45@55c.; Southern, 40 @45c. Geese, Jersey, $1.50@1.75; N. Y. and Penn. $1.25 @1.37; Western mixed and Southern, $1@1.25. Pigeons, large, strong birds, 35c.; young, 20c.

New items of game are here, but the weather has been against quality and sales do not open briskly. Grouse quoted 75c.; partridges, $1.25@1.50; woodcock, 75@85c., which is lower; English snipe and plover, $1.75@2; blackbirds, 18c.; reed-birds, 25c. A Western correspondent informs us that grouse will be fairly plenty, but it will be a light season for quail.

PROVISIONS.—A desirable feature of the week is the revival of an export demand, which extends liberally to all kinds of hog products. Pork is taken steadily for the West Indies and the Provinces, high prices forming no restriction. The long lock-up in lard has been loosened and a full legitimate business is noted. Bacon and cut-meats are in good demand; hams and shoulders stiffened by the active local wants of warm weather.

Pork, extra prime, ₱ bbl. $17.50@18; Western mess, new, $18.75@19. Lard, steam Western, ₱ 100 lbs. $11.70; prime city, $11.60. Hams, smoked city, ₱ lb, 12½@ 12¾c.; pickled Western and city, 11¾@12c. Shoulders, smoked city, 8½c.; pickled, 7¾@7¾c. Rib bellies, pickled, 9¾@10¾c. Bacon, long clear and Western, 10c. Beef, India mess, tcs. 22@23c. Beef hams, bbls. $24.25@22.50.

Receipts for the week—Beef, bbls. and tcs. 909; pork, bbls. 71; cut-meats, pkgs, 25 748 lard do 8,095

Exports for the week—Beef, bbls. and tcs. 955; pork bbls. 1,148; cut-meats, lbs. 5,481,881; lard do. 2,996,400.

RICE.—There is an increased activity in the domestic orts. The reports from the Atlantic coast confirm the large damage claimed to have been done the new crop by the gale last week. In some instances whole crops were swept away. The destruction on the coast has caused a sharp advance in New Orleans. Prices here are unchanged, as the stock is sufficient for several weeks to come. We quote Rangoon to fair Carolina and Louisiana at 4½@5¼c.; good at 5¾@ 5¾c.; good to prime (new crop) at 6¼@6¾c.; fancy at 7½@7¾c..

SALT.—Quotations are: Ashton's at $2.50; Higgins's at $2.40; Holmes's extra sifted, $2.40; Deakin's at $1.25; Evans's at $1.30; Washington's at $1.25; Marshall's at $1.25; Virden's at $1.20; Worthington's at $1.30; Mediterranean at 25c.

SEEDS.—There is a fair demand for clover and prices strong. The range is 9@10c. for '79 to '80 growth in car lots on track. Timothy in fair demand at $2.60@3. Domestic rough flax, $1.15.

Exports of grass seed for week, 1,751 bags.

SUGAR.—Refined is firm and in good demand.

Cut loaf, 10¾c.; crushed, 10¼c.; powdered, 10¼c.; granulated, 9⅝@9¾c.; mould A, 9¾c.; confectioners' A, 9¼c.; standard A, 9⅜; off A, 8⅝@9⅛c.; white extra C, 8⅝@8⅞c.; yellow extra C, 8@8⅛; C, 7½@7¾; yellows 6⅞@7⅛.

VEGETABLES.—Exports of potatoes, 6,551 bbls. A good many new points are drawing supplies from this city, and with the regular Southern call the market is firm.

Early Rose, L. I. extra, bulk, ₱ bbl., $1.87@2; L. I., fair to good, $1.75@1.87; Jersey, $1.62@2; up river, $1.75@1.87; Snowflake, $1.75; Burbank, $1.62@1.75; Peerless, Jersey, $1.62@1.75; sweet potatoes, Va. yellow, $3.25@3.50; Del. river, $3.75.

Garden stuff sells well. Tomatoes did not hold their advance long. Onions plenty and dull.

Sweet corn, July, prime ₱ 100, 75c.@$1; inferior, 50@60c.; wax beans, L. I., ₱ bag, $1.50@2; string beans, L. I., $1.50@2; Lima beans, potato, $1.50@1.75; Lima beans, flat, $1@1.25; cucumbers, L. I., ₱ 100, 75c.@$1; cucumber pickles, $2; egg plant, L. I., ₱ bbl., $1@1.25; tomatoes, ₱ bush., 20@25; Squash Marrow, ₱ bbl., $1.50 @1.75; cabbage ₱ 100, $6@7 beets, L. I., ₱ bbl., $1@1.25; white onions, $2@2.50; yellow, prime, $2@2.25; red, eastern, $1.75@1.87; Chester, $1.50@1.75; carrots, $1@ 1.50; turnips, Russia, 50c.@$1; okra, ₱ 100, 15c.

WOOL.—Sales are light, as holders seem unwilling to make concessions for fine lots. The market is not in a position for comprehensive quotations, but it is possible that a scale can be arranged by next week. Low-grade wools are neglected.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Sept. 3, 1881.

BEEVES.—Receipts for the week, 8,689 head; do. last week, 12,312 do. Cattle sold quickly at some advance over Wednesday, and strong markets are looked for next week. Some very coarse Colorados sold down to 7c. to dress 51 lbs, but the general sales of Colorados were at 7½@8¼c., with a few car-loads of prime up to 9@9½c. Texans brought 7¼@7¾c. About 140 head of Illinois half-breeds from Kansas and Southwestern Mo. were sold at 7@7½c. to dress 54@55 lbs. Very common native steers sold down to 8c. to dress 55 lbs., and strictly choice do. up to 11¾c. to dress 57 lbs, but the bulk of the sales were from 8¾ to 10c. to dress 55@56 lbs. Bulls continue in buyers' favor; small Statd grassers sell as low as 2½c. live weight, and it takes a good lot of corn-fed bulls to bring 3¾c.

COWS AND CALVES.—Receipts have run light and prices at the moment are strong. Very common cows have sold at $30@35 ₱ head; good, $50@60 do., and extras at $65@70 do. It should be remembered, however, that supplies may enlarge suddenly, as diminished pastures hereabouts will tend to send the surplus of herds to market, and quotations would decline with stock forced on the market.

SHEEP AND LAMBS.—Receipts for the week, 22,686 head; do last week, 28,702 do. Moderate offerings were none too favorable for trade, as a number remained unsold. Poor to really prime sheep, 5@5¼c.; do. lambs, 5@6¾c.

SWINE.—Receipts for the week, 14,887 head; do. last week, 13,850 do. Live steady at 6½@6¾c. for corn; Ky. grass quoted 5c.; N. J. pork, 8½@9½c.; city-dressed, 8¾@8¾c.

VEAL CALVES.—A fair demand prevails for prime live, but between them and under-grade the range is wide. Market fairly steady.

Live calves, prime N. J., 8c.; do. State, 7¾@8c.; poor to good, 6@7½c.; Mount Hollys, 8½@8¾; buttermilks, 4@4½c.; grassers, 3@3½c.; up-river dressed, 11@11¾c.

For the Young.

FARMING FOR BOYS AND GIRLS.
No. 33.

HENRY STEWART.

Farm Crops. Wheat.

WHEAT is the most important crop grown on farms. It is not the most valuable, but it is that which the world could least spare, because it is the world's bread. It is a farm plant; none is known to grow wild; we do not know its origin, or when it was first introduced into cultivation; but it is probable that it has been grown by men from the earliest ages and has never been able to exist except by the careful attention of the farmer. It requires the best cultivation and only the best farmers can grow large crops of it. Usually the yield is very small as compared with what is grown under good culture and even less than 12 bushels per acre is produced, while a full crop may be more than 60 bushels, and a fair crop may reach 40 bushels.

Wheat requires a good soil and that the soil should be very well prepared by plowing, harrowing, and rolling; if necessary. The best soil for wheat is a limestone clay and the soil is in the best condition where it is fine and mellow and well packed in under the surface and somewhat rough on the top. There is but one species of wheat, but there are many varieties. There are Spring and Fall wheat; white, amber and red wheats, so called from the color of the husk; but each kind may be changed, by varying the manner of cultivation for a few years from one kind to another.

Wheat is one of the grasses. The plant has a root, a stem or straw, long, narrow leaves which clasp the stem and a head or spike. The spike consists of a number of spikelets arranged alternately upon each side of the stem, which is bent from side to side to receive the spikelets. The spikelet consists of three pairs of glume, which are the chaff of the wheat, and which inclose the grain; but it is rare that any one of these spikelets contains more than two grains, the middle glumes being nearly always empty. This of course lessens the yield of the crop and so does the smaller number of the spikelets produced when the cultivation is inferior. A head of wheat may contain but 20 or 24 grains, and it may contain more than a hundred when it has been well grown upon good soil, and a good variety has been chosen for the seed. When grown upon good soil there are several stems proceeding from each root, and it is not unusual for a root to have from 10 to 20 or even more stems and heads growing from it.

These facts go to show how important it is in growing wheat for the farmer to procure good seed; to have the soil in good condition; and to put the crop in the ground in the best manner. For with a poor crop the grains in the spike are few, the spikes from each root are few or but one or two only, and the yield is very small. But with a good crop the grains in each spike may easily be multiplied three or four times, and the spikes increased four or five times above the yield of a poor crop; and thus the whole increase will amount to several times the quantity of the smaller yield. This gain is of the greatest importance not only to the farmer who grows the wheat, but to those persons who consume it, for the better and larger the crop the cheaper will be the grain, and yet the greater will be the farmers' profits.

Wheat is a very exhausting crop to the soil. It therefore requires the soil to be rich in all the elements of fertility, viz., nitrogen, phosphoric acid, potash, magnesia, lime, soda and some others; so that the best farmers find it profitable not only to apply abundance of good manure, but to use also some artificial fertilizers with it as a help. The fertilizers commonly used are lime, superphosphate of lime, ashes or salt and sometimes all of them may be used with advantage.

PET BIRDS.

Parrots, Macaws and Cockatoos.

PRETTY POLLY is always a favorite. The grey bird is the most docile and intelligent, and the best talker, as well as the largest—measuring from ten to twelve inches in length. The bill is black, strong, and much hooked, and the orbit and space between them and the eyes is covered with a bald and white skin. The entire body is of a combined pearl-grey and slate color, and the feathers of the head, neck and under part of the body are edged with a greyish white. The toes are grey, tinged with red, and the tail is of a deep, light scarlet. The grey parrot is healthy and long-lived, sixty or seventy years being the average.

The Green Parrot, from the regions of the Amazon, South America, is nearly as large as the grey bird; the prevailing color of the plumage is brilliant green, but the back and under parts are tinted yellow. The fore part of the head is of a blue tint, and the throat-feathers are edged with a bluish green. This parrot talks well. A green parrot of an inferior kind comes from the West Indies. The pinion feathers are red and blue, and the head yellowish red.

Parrakeets are smaller birds, and the prominent peculiarity is the length of the tail, generally exceeding that of the body. The Yellow-bellied Parrakeet, from Tasmania, is hardy and well adapted for a caged life. The Rose-bill Parrakeet, from Australia and Tasmania, is one of the most beautiful birds of the Parrot family. Including the fine tail, it measures about thirteen inches. The head, sides of the face, back of the neck, and breast, are of glowing scarlet, and a scarlet band passes over the shoulders; the upper part of the throat is of pure white; the feathers of the back are black-green, edged with light and very bright green. In the wings lilac-color is mixed with black. The lower part of the breast is yellow, changing into light green on the abdomen. The Ground, Ringed (the latter with a very long tail), and Grass Parrakeets, are also pretty birds. Little Love Birds, so named from the affectionate manner in which a pair sit together, are pretty little creatures, scarcely six inches long.

Cockatoos come from the Eastern Archipelago and Australia. They are large and powerful birds, and the crest, composed of a number of feathers which lie along the neck, except when the bird is angry, and then they are erected, and opened and closed quickly, like a fan. The Great White and Sulphur crested Cockatoos are the best known in England. Most of these birds can be taught to utter simple words and phrases.

The magnificent Macaws, with their splendid blue and yellow, or green and scarlet plumage, are well known.

Bread and milk is the staple food of all birds of the Parrot kind. Lay a slice of stale bread in a pan, and soak it in warm water for a quarter of an hour, and then pour enough scalding milk on it to moisten it, without making it pappy. Cleanliness of the cage, and plenty of dry gravel are essential to the health of the bird.

THE CHILDREN'S PLOT.

I WONDER how many of the young readers of the RURAL have a little plot of land set apart for their own special working-ground? Surely, out of almost a thousand young people who are members of the Horticultural Club, there ought to be a large number who have a "little farm" which is under their own care and cultivation, and in which they may pass many hours much more profitably than in idle sport.

Now, methinks, some far off Western boy is saying to himself, "I guess Uncle Mark has forgotten that all work and no play makes Jack a dull boy;" but not so! It's a proper combination, or relation of work and play that is most beneficial, and most to be desired for the young. There are many hours in the course of a week as for instance before school time in the morning and after school in the afternoon, or on Saturdays when there generally is no school in the country, when it would be "nothing but fun" to work in the little garden or whatever it might be called. The plot need not be a large one, the size will depend somewhat on the way "father feels" when the request for it is made. Remember one thing which older farmers often forget, that the largest farms do not always produce most. Thorough cultivation goes far in the production of large crops, so even if you are allowed but little ground you *can* make that little pay a good interest.

I am sure that a great deal of pleasure and satisfaction would come from raising "big things" for the fair, and competing, then, with father or the neighbors for the premium. But how very seldom we hear of a little boy or girl who takes any thing to the fair—but a lunch. Yet, if "Master Johnny Gray" has the finest basket of potatoes or largest pumpkin there, he is entitled to the premium just as much as if he were "John Gray, Esq." Nothing would please me better to read in some of the many letters that will be received this Fall, that the members of the Horticultural Club had really taken premiums at their local fair, for this would denote an interest, on their part, in agricultural and horticultural affairs, and I should almost want to "jump out of my boots" if the premium articles were raised on their own plot of ground by their own cultivation. UNCLE MARK.

YOUNG QUERIST.

Ella F., New Alexandria, Pa., asks, 1, where roots or seeds of the Water Lily may be purchased, and, 2, the name of a vine, for a piazza, that will stand the sun well.

ANS.—1, Of almost any nurseryman. 2, The Wistaria (Wistaria frutescens); Hall's Honeysuckle (Lonicera holliana); Virginia Creeper (Ampelopsis quinquefolia); Clematis (Clematis vilicella); and Dutchman's Pipe (Aristolochia sipho.)

Flora M., Cross Creek Village, Pa., asks how to keep the worms from working on the cabbage, not only the green worms, but the big, striped, brown ones.

ANS.—An application of dry, unleached wood ashes has been effective. Drenching with hot water, decoctions of elder and dog-fennel, or dusting with powdered hellebore, lime, and ashes are recommended.

Willie M., Ilion, N. Y., asks for a description of the plum curculio and its entomological name.

ANS.—It is a dark brown, plump beetle, about one-fourth of an inch in length. Its wing covers are speckled with black and white and roughened by little lumps. It has a short, curved snout. It is known to entomologists as Conotrachelus nenuphar.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—I would have written sooner but have been very busy, and I wish to tell you what I have been doing. To begin at the first, please go back with me to the cold, snowy days of Winter when I got the first RURAL and looked over the advertisements to see what nursery to send to for the seeds and plants that I wanted. I selected three, and to each one I sent a postal card asking for their catalogues, which came in due time. Then came the fun, there were so many pretty flowers and plants that I could scarcely make a selection, but after examining all the books I concluded to send an order to each, and I am well pleased with the results. Those who have seen our garden say it is the best in this vicinity. Uncle Mark would be sure to throw this in the waste basket if I even commenced to tell what kind of seed I got, for there were two kinds of nearly every garden vegetable, besides many flower seeds. My brothers got several kinds of watermelon seed, also popcorn, both of which are doing very well. The prettiest flowers in the whole lot are the China pinks sent by Uncle Mark. I started my tomato and cabbage plants in a hot-bed early in the Spring, but the worms are beginning to work on the cabbage plants. However, some of the early kinds of cabbage have heads large enough to eat. Your niece,

HATTIE BELL PRIMROSE.

Cross Creek Village, Pa.

UMCLE MARK:—From the seed of the Crimson Dwarf Celery, that you so kindly sent me, I have raised five hundred and fifty plants. Three hundred of which I have transplanted into rows in the garden, and of the balance I have sold 75 cents worth, and given away the remainder. The Pyrethum Roseum seed came up finely, and was transplanted to the garden. The dry weather was too much for some of it, yet I have four plants now growing. You said you desired the Cousins to save the seed. My plants show no signs of flowers as yet. Of the Judas tree, or Red Bud, but one seed has thus far germinated. It has grown into a nice plant about seven inches high—large heart-shaped leaves, and seems very thrifty. It is still in the pot and I shall take it into the house and Winter it. If my celery does well, (the weather is very dry), I expect to realize about ten dollars from its sale—enough to pay the subscription cost of the RURAL for the next five years. Your nephew, HARRY R. FRENCH.

Elmira, N. Y.

DEAR UNCLE MARK:—I should have written to you before to thank you for the beautiful present you sent to reward me for my efforts to take the prize for mathematical drawing. It is a splendid engraving and I shall some day have it framed, to remember your kindness in sending it. Most of the corn about here was planted the first of June or thereabouts, and unless Jack Frost keeps off pretty late it cannot mature. Many farmers are not cutting their wheat, the scab and blight destroying most of it. Oats are the only good crop this season. My flowers are large and handsome. I have a fine show of lilies. I sowed but few flower seed this Spring, but depended entirely on the plants that came up from last season's seeds. The plants thus obtained are doing well. I have a handsome show of phlox and pinks from them, also a number of plants of the pinks and carnations from the RURAL. The celery did not grow and the Red Bud does not come up yet.

Purple Cane, Neb. W. J. MASON.

New Publications.

A QUINTETTE OF NEW MUSIC BOOKS.

Ditson & Co. *have ready for the Fall Trade, and for the use of Music Teachers, Choirs and Singing Classes, the following books, of unapproachable excellence in their special departments.*

Emerson's | HERALD OF PRAISE. | ($1.) The new Church Music Book for 1881-1882. Send $1. for *Specimen Copy.*

PERSONALS.

Archbishop Purcell now has to be fed by an attendant, so weak has he grown.

Banker George W. Riggs of Washington, D. C., died at his country home at Greenbrier, Md., Wednesday week.

Whittaker, the colored cadet, wants to exhibit his ears—what's left of 'em—on the lecture platform for $3,000 a season.

Ex-Congressman Martin F. Conway, of Kansas, who shot Senator Pomeroy, has been released from an asylum for the insane.

"Uncle John" Stewart, of Shelby County, Alabama, is the oldest man in that State. He was born 102 years ago and has about 200 living descendants.

Johnny Skae, formerly a leading San Francisco millionaire and at one time the owner of $10,000,000 of Comstock mining stock, went to the station-house the other night because he could not give $5 bail—drink.

The Duke of Argyll, who re-married the other day, passed his honeymoon at his father-in-law's, the Bishop of Rochester's palace Only one of his sons appears to have attended the marriage. The new Duchess will find a large ready-made family, by all accounts not too delighted to see her. The Princess Louise was not at the marriage.

With an earldom, $750,000 a year, youth, health, a pleasing wife, a taste for sport, and four of the choicest homes in the world, Lord Roseberry, to whom Mr. Gladstone owes his seat for Midlothian, puts his nose to the grindstone in a government office under that not particularly agreeable man Sir William Harcourt. England may be congratulated on her Roseberries.

Brother Knowiden's polygamy is of a kind that even Mormons do not approve. He has a wife in each of seven Utah towns, so that in his travels he is provided with convenient lodgings free of cost, for he lets the wives support themselves. One of them became so poor that she nearly starved to death, and Knowiden was mobbed the next time he visited her.

[La Fayette (Ind.) Sunday Times]

Our city Druggist reports an immense sale of St. Jacobs Oil, saying the demand is based upon the popularity of its success. Wherever it has been used, it has proved its value a thousand fold, and receives its best encomiums from those who have tried it.

KIDNEY WORT
THE ONLY MEDICINE
IN EITHER LIQUID OR DRY FORM
That Acts at the same time on
THE LIVER, THE BOWELS, AND THE KIDNEYS.
WHY ARE WE SICK?
Because we allow these great organs to become clogged or torpid, and poisonous humors are therefore forced into the blood that should be expelled naturally.
KIDNEY-WORT
WILL SURELY CURE
KIDNEY DISEASES,
LIVER COMPLAINTS,
PILES, CONSTIPATION, URINARY DISEASES, FEMALE WEAKNESSES, AND NERVOUS DISORDERS,
by causing free action of these organs and restoring their power to throw off disease.
Why suffer Bilious pains and aches?
Why tormented with Piles, Constipation?
Why frightened over disordered Kidneys?
Why endure nervous or sick headaches?
Use **KIDNEY-WORT** *and rejoice in health.*
It is put up in **Dry Vegetable Form,** in tin cans one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated,** for those that cannot readily prepare it.
☞It acts with equal efficiency in either form.

THE MAPES COMPLETE MANURE

For Wheat, Rye and Grass.

1,180 bushels wheat from 36 acres; average, 33 bushels per acre; the whole piece planted again Fall of 1880, to wheat without manure or fertilizer of any kind.

W. S. COMBS, FREEHOLD, MONMOUTH CO., N. J., April 26th, 1881, reports—

"Acres sown, 36, 19 of which were stubble and 17 stiff timothy sod; variety sown, Fultz about two bushels per acre; soil, a pretty stiff clay.

Treatment.—30 acres, 500 lbs. per acre of the Mapes Complete Manure for Heavy Soils alone: 6 acres dressed with stable manure, about 10 loads to the acre, and 500 lbs. of the same Complete Manure for Heavy Soils.

Results.—1,180 bushels and 37 lbs. of wheat, and 45 tons of straw when pressed. The quality of the wheat was good, weighing 62 lbs. to the measured bushel. The weather during, and for weeks after, sowing was so exceedingly dry that the grain sown on the sod piece did not come up as evenly as on the stubble, and as a result the yield from this piece reduced the average yield considerably. The yield from the 19 acres of stubble was estimated (the two plots not being separated) 40 bushels per acre. The grain from the two pieces was harvested together, and when threshed was accurately measured and weighed (1,180 bushels and 37 lbs. from 36 acres; average, 33 bushels per acre).

About three weeks before harvest the army worm entered the field and marched directly across it, stripping the leaves from the stalks and cutting off the smaller heads. They did considerable damage, just how much I am unable to say.

Have sown the whole 36 acres again with wheat, without the application of any manure or fertilizer."

W. S. COMBS writes again July 19th, 1881—

"You ask an estimate of this year's yield of wheat. I do not think much of *estimates*, so I will give you what facts I can. The piece of ground is the same as that sown with wheat in 1879—and of the treatment, yield, etc., you have already had my report. Last year it was again sown with wheat (Fultz), about two bushels to the acre, no manure or fertilizer of any kind or description was applied to the ground. The crop has been gathered by the same men and put in the same buildings; a self-binding machine was used this year. The crop this year occupies just four-fifths as much space in the buildings as did the crop of last year.

I can only say that I am extremely well pleased with the result, and will forward you the exact figures as soon as I can get them.

THE WEEPING SOPHORA.

Sophora Japonica Pendula.

SAMUEL PARSONS, JR.

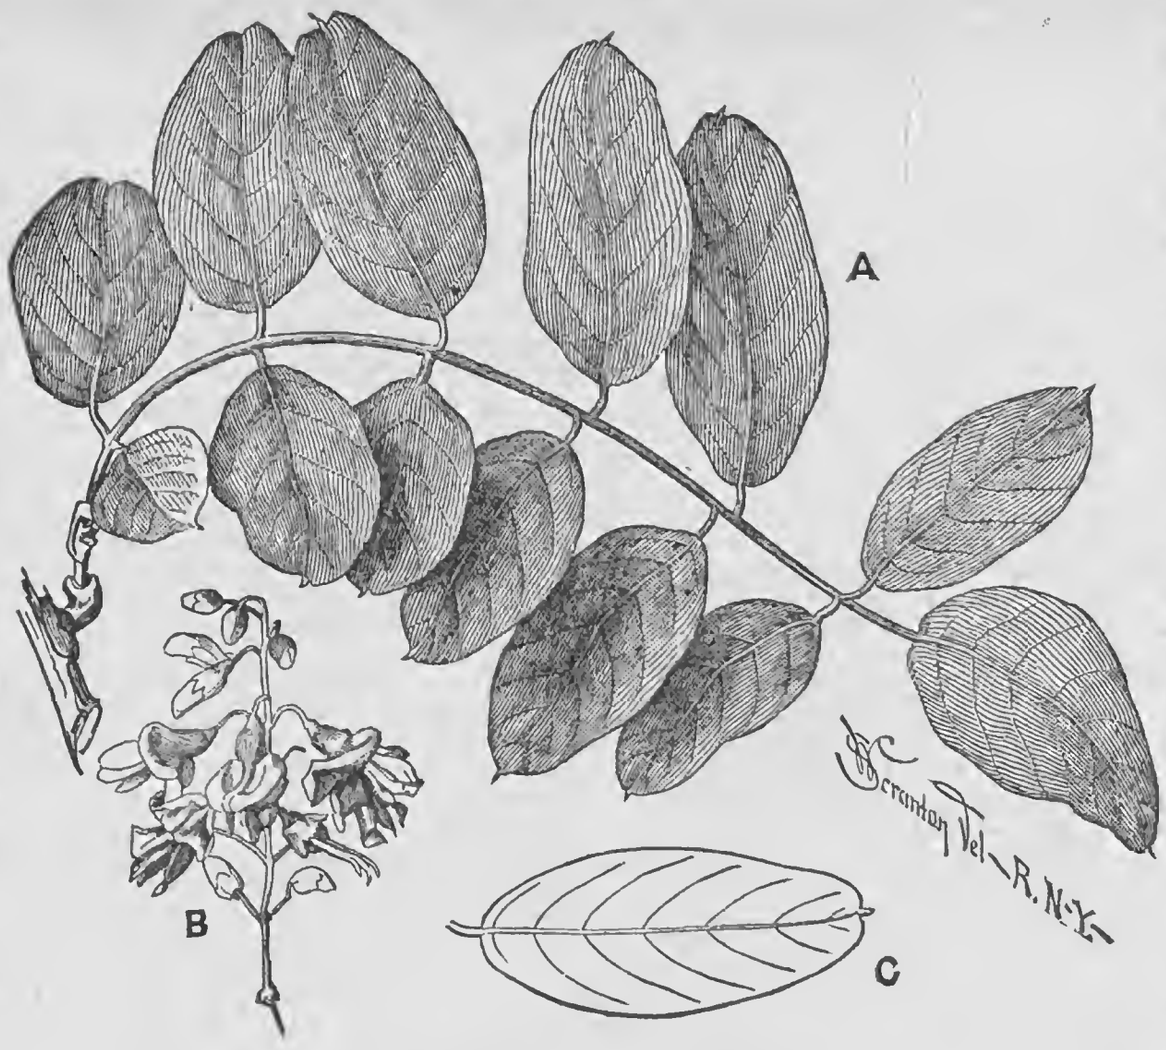
WEEPING is a misnomer—it should be drooping. Pendulous, the Latin word being *pendula*, expresses a tendency shown by some trees to extend their branches out and down in more or less definite curves. This habit is, in the first place, an accidental sport or freak of some particular specimen. The branches or twigs, of such a tree are cut off and grafted on a plant of the ordinary parent type, thus perpetuating the desirable peculiarity. There are two kinds of weeping or drooping trees: one, like the Weeping Beech, tosses and droops its branches now here, now there, with the most charming abandon and beautiful picturesqueness of effect; the other is rounded, symmetrical, dignified and more or less parasol-like in form.

To the last belongs in the most definite manner the subject of our sketch. The illustration serves only to show the character of the foliage and flowers. Few trees have foliage more positively beautiful than that of the Sophora Japonica pendula. The leaf itself is small, scarcely an inch long, with a perfectly oval outline and smooth, delicate surface. Its color is rich green, darker than that of the Virgilia lutea, which, however, it resembles in size and outline of leaf and flower and other characteristics more difficult to define. The flowers are white or yellowish-white, small and of a decidedly leguminous appearance, hanging during August in loose panicles sometimes a foot long. This summer-blooming quality is valuable because limited to a few trees and shrubs. A Drooping Sophora, seldom, if ever, blooms until it is old, and then sparsely and by no means every year. When in bloom, however, a large Drooping Sophora is a sight to behold, all embroidered with cream-colored blossoms on a ground-work of gracefully arranged masses or folds of dainty, exquisite leaves. The trunk of this, as well as of other sophoras, is light, somewhat rough and corrugated, but the bark of the branches and twigs is smooth and of a rich green color. These branches and twigs have a curious fashion of bending suddenly in short, grotesque curves—a peculiarity which serves to give the tree a perfectly parasol-like form, and arbor-like umbrageousness.

The Weeping Sophora grows slowly and lives long. One sees now and then a specimen in perfect health and vigor at least 30 years old and not over eight or nine feet high. There are very few Sophoras to be seen anywhere in this country. If there were more we should have many long-lived, perfect specimens; for the Weeping Sophora is singularly perfect during late life. As a tree it is not generally considered quite as hardy as the Weeping Beech and other drooping trees. This applies, however, to its young state, and to conditions induced by recent transplanting. The bark, too, of the stem or trunk is liable to suffer from American extremes of heat and cold. It is a good plan to bind the bark with moss for two or three years after transplanting. When fairly established in the soil, the Weeping Sophora seems as hardy as most other ornamental trees. It does not transplant readily unless it has been moved repeatedly; or what amounts to the same thing, unless thus transplanted the roots are apt to be bare prongs without fiber.

Propagators find this tree a difficult subject to handle. In the first place, to graft it high, a straight, clean-barked seedling of Sophora Japonica is required, and this can be most surely obtained by allowing the seedlings to stand close together in the row surrounded by other rows of large growing deciduous trees. The shaded seedlings thus naturally shoot upward clean and straight in search of more light. Then, the grafting is no easy operation. The mechanical process of inserting the graft and waxing and covering it with oil-paper is not so difficult, but the protection of the fresh union throughout the following Winter is an undertaking subject to many accidents. The low-grafted form of the tree has its advantages. Its short, protected stem needs little, if any, shelter from the cracking effects of sun and wind. Altogether it is hardier than the high-grafted form and specially adapted, from its dwarf and somewhat irregular habit, to the nooks and corners of rock-work. The Weeping Sophora needs no pruning, except now and then to remove a bit of dead wood; its growth is invariably slow and well regulated. On the lawn it should occupy distinguished and isolated positions; far enough away to be seen with effect from a porch or window and yet not too far for a due consideration of charms that bear, and are worthy of, the closest examination.

There are several good specimens of Weeping Sophoras in the Boston Public Gardens, in Flushing and a few other places in the country, but it is a rare tree. Yet it should not, and need not, be rare. If the public insisted upon having it, the demand would be met sooner or later. An enlightened public interest is all that is necessary to secure with a little patience, a moderate supply of any ornamental tree or shrub.



THE WEEPING SOPHORA.—FIG. 555.

THE WEEPING SOPHORA.—Our engraving was drawn from a specimen kindly furnished us by Mr. Parsons. The compound leaf is marked A.; the flower raceme B. and the leaf of natural size C. Several years ago, a specimen of this attractive tree was planted at the Rural Grounds in the Fall; but it did not survive the severe Winter which followed. We have always, however, in the trying climate of the Rural Grounds met with better success in Spring than in Fall transplanting, let the kind of tree be fruit or ornamental. At the Rural Farm, on the other hand, where the soil is more sandy and susceptible to dry weather, Fall transplanting has always proved successful.

Horticultural.

RURALISMS.

IN a recent letter to me Mr. Downing says: "The New Rochelle is, as you say, very productive, but the color is against it as a market fruit, and I think one of a better color and better flavor will take its place some day." That is well said, I add my own hope to Mr. Downing's. A New Rochelle with a bright color and acceptable flavor would be decidedly the greatest acquisition that has yet been made to the whole tribe of raspberries; and we shall have it yet if originators of fruit will only turn their attention in that direction. Let any man who has a plant or two of the New Rochelle study its habit thoughtfully for a single season, and I think he will reach the conclusion that, aside from the color and flavor of the fruit, the plant has more desirable points than any other raspberry in cultivation. Here is a good starting point and a rare opportunity for some man to make himself famous. May I live to make a grateful record of his success!

I HAVE before, in this column, made allusion to the discreditable manner in which some parties pack apples for the English market. Since then the complaints have grown louder and more frequent, and always coupled with the statement that our Canadian neighbors thus far pack fairly. Investigation, I am sorry to say, shows these complaints to be, in many cases, well founded. All, of course, do not resort to this reprehensible method, but all should feel an interest in exposing and correcting the evil as far as may be, for the sake of our common reputation. It will only result in hurting the trade, and this trade is already of such dimensions as to be worth preserving, apples now forming an important item among our exports. It is officially stated that 1,203,670 barrels of apples were received in England from the United States during the year 1880. These figures will surprise many, but there can be no doubt that they may be greatly increased if some regard be paid to the much neglected "golden rule," which is just as good in trade as anywhere else.

I NOW remember seeing the Skowhegan Raspberry at Mr. Force's, but without, at the time, knowing its name. Mr. Downing saw it there during the past season, and says of it: "It is a week earlier than any other Black-cap, is of large size, jet black color, very productive, sweet, juicy, and rich. I think it an acquisition among the Black-caps." He further says: "I was at E. P. Roe's, and saw the Centennial, another Black-cap, equally as good as the Skowhegan in all respects; if there is any difference, it is in favor of the Centennial. As to quality, they are both superior to the Gregg or the Mammoth Cluster, but not quite as firm in texture." The Black-caps, it will be seen, are coming to the front, and this is only the beginning of the end. Their hidden capabilities have hardly been suspected yet. But wait.

CAN anybody tell me why some of our best fruit trees should not be used as ornamental trees on the lawn? I mean any good and sufficient reason outside of the domain of prejudice and sentiment? For example, my friend, who is a gentleman of culture and refined taste, has bought a small place in the country, and wants fruits, flowers, vegetables, ornamental trees and shrubs, and a small lawn; that is, a real lawn, and not a sham. Apples, pears, peaches, etc., he cannot have in useful quantity unless they are used as accessories to the lawn. Then why may he not use them in this way for the purpose of ornamentation, not exclusively, but in combination with what are called ornamental trees? I have told him he may. Is it anything deeper than prejudice which prevents the judicious use of fruit trees on the lawn? I have so employed them several times where fruit could not otherwise be grown, and am by no means dissatisfied with the result. Pleasing effects can in this way be generally produced even on a limited scale. A peach, a cherry, a plum, etc., with double flowers, are ornamental trees; with single flowers they are not. But why? What can be more beautiful than an apple, a pear, or a peach tree in full bloom? Where a man has the choice of an orchard, that is the better place for his fruit trees, as he can cultivate them there as he cannot on the lawn, and secure better fruit; but by top-dressing the lawn he can be pretty sure of fair crops of very good fruit. Therefore I say that, rather than be without fruit, I would plant fruit trees on my lawn.

THE seed catalogues still continue to say that the Dwarf Golden Wax Bean is eight to ten days earlier than the Black Wax, and I still continue to prove that it is not. I have tried them again this year, with the same results as heretofore, that there is less than a day's difference between them. I imagine it will be a long time before the Black Wax is much beaten in the race for earliness; yet our seedsmen still say it is eight or ten days behind, and will not be convinced to the contrary. They mean well, and I think well of them, so I shall continue to pray for the horticultural sinners till they repent. The reader should know that these Wax Beans are among the earliest and best of beans.

ARE Agricultural Societies and similar institutions as careful of their reputation for consistency and justice in their awards as they should be? In 1879, at a certain fair, a committee of experts reported a certain article as having no special merit, and as being a foreign invention, which latter of itself barred it from

competition under the charter of the institution before which it was exhibited. In 1880 the same article was exhibited again, and a committee of two only, who were not only not experts, but quite ignorant of the use of the article as well as of its principles of construction, recommended it for a certificate of merit, thus stultifying the institution, depreciating the value of its awards, and lessening its influence among the public at large. Does not something like this take place occasionally at some other of our State and county fairs? I fear so. Again, can any real estimate be formed of the value of a new implement without, in most cases, an actual trial in the field, under the eyes of experienced men? I have seen a new and untried seed-sower rolled a few times over some boards, and then awarded a first-class prize. This is one case of many. A prize so awarded may do the inventor or the manufacturer much good; but how about the society and the public? Should they not be thought of, too? The subject is full of embarrassments, I know, but would anything be lost to the parties most interested if the president and the managers should look a little deeper into the working of their own machinery, and not leave it to go so much alone?

A MORE or less common village scene. Mrs. A. has a good many household cares, but is fond of her plants, and has come out to do a little weeding. Mrs. B. is a neighbor, and one of those selfish or unfortunate beings who do nothing themselves, except gossip, and make it the business of their lives to prevent others from doing anything. Mrs. A. no sooner begins weeding than Mrs. B. is through the gate and at her side. In a few moments a peculiar chord seems to be struck, weeding is suspended and an animated talk begins, and goes on for an hour or so. Mrs. B. then, for some reason not apparent, goes home; Mrs. A. begins weeding again, and I walk off. I have become interested, however, and in about half an hour return for observation, and as sure as I live, there they are at it again, and, to look at them, you would think by their actions that they had not seen each other for twenty years. And this I saw repeated three or four times during the day. Now how is Mrs. A. ever to get her weeding or anything else done with such a neighbor at hand? And of what use to the world is Mrs. B. anyhow? And what do they talk about all this time? I am greatly puzzled. Is there any rational explanation for it? I am only telling what I have more than once seen, and what others also have probably seen. If Mrs. B. can find nothing useful to do, she should at least remember that there are others who can, and want to do it, too. The Mrs. B's. are certainly not honey bees, who are workers, though they do sometimes sting.

HORTICOLA.

The Rotting of the Tomato.

The RURAL may be, and no doubt is, correct so far as its observation extends, in attributing the rotting of tomatoes to the tomato worm, but could the editor see mine, he must agree with me that such is not always the case. So far as I can discern, the tomato worm is the Carolina Sphynx, or tobacco worm. [No, ours is the Five-spotted Sphinx—S. quinquemaculata.—EDS.] It appears on tomatoes before tobacco is sufficiently grown to receive much injury from its depredations—in June, or sometimes in May—whereas the fight on tobacco does not become serious until August, at which time no worms are to be found on the tomato plants. This year I have been unable to find one since about July 1, and yet the fruit decayed and is still decaying when nearly or quite matured, with no indications of being injured by worms or any other cause. Furthermore, I have noticed green specimens with perhaps a tenth part eaten away (I suppose by the worms; I did not see them do it), yet the wound has dried over, healed, and the portion remaining has ripened sound and perfect. As the cause cannot be assigned, of course no remedy is recommended.

Warren Co., N. C. M. B. PRINCE.

Practical Use for Yucca Filamentosa.

When the RURAL presented its readers with seeds of "Yucca filamentosa," known also as "Strong Grass," "Bear Grass," and "Thready Eucre"—the latter probably a corruption of the real name—the editor said nothing of the useful properties of the leaves, no doubt believing, as all must, that the flowers would repay the care and trouble of growing. Yucca grows spontaneously in many parts of the South, where it is made practically useful, of which fact many at the North who now have it growing in their gardens, are entirely ignorant. We pull away the leaves as every pie maker knows how to gather pie-plant. In almost every garden in this State is found a thrifty bunch of Strong Grass, to which the whole family resort whenever a short, strong tying material is required. The meat is hung up with it; bags are tied with it; and this year having used the last of some inferior twine, I tried the Yucca leaves for tying grape-vines, and find them superior to anything ever used except wire.

M. B. P.

Farm Topics.

SOME EXCELLENT HINTS TO EXHIBITORS OF FARM PRODUCTS AT FAIRS.

THE most seasonable topic at this season of the year for the consideration of the farming community is our agricultural exhibitions. Outside of the professional stock-breeders, gardeners and mechanics who have wares which they consider necessary to be kept before the public at all times, there are very few who give agricultural shows a thought until a few short weeks before the date of exhibiting. Those who exhibit year after year always pay some little attention to such things and know how to excel. This class I do not presume to advise. To the other and greater class who only exhibit some choice article occasionally, a few practical hints may be of great value.

Now, although no one pretends to exhibit for the sake of winning the premiums offered, but only to gratify the pride of succeeding in an honorable competition, still it is necessary to procure a copy of the premium list offered by the society in order to see what avenues are open to honorable competition, and, incidentally, to see what amount in money is to reward the successful, honorable competitor. If, as is sometimes the case, the exhibitor intends to fill all the entries in any particular class, it is demoralizing to compute the amount of premiums for that class—at least before the judges make their awards known, for judges are after all only human. Very few farmers in preparing for the fair forget their pumpkins and turnips, their potatoes, corn and smaller grain. Now, in all the premium lists that I have ever seen, in the class of vegetables occurs this note:

"All the above to be field culture and to be a fair sample of the crop. Potatoes and roots to be shown as dug, not sorted."

Now, I fear that an amateur exhibitor might be misled by this note. Some inexperienced farmer might show a basket of potatoes in which there were some small and a good many medium-sized tubers. Such a foolish exhibitor would meet his merited reward: his potatoes would be unnoticed by the judges among the great quantities of tubers neatly washed and sorted. Potatoes as well as other vegetables should be a fair sample of the whole crop. Webster defines "fair" to be, 1st., free from spots, dirt, and imperfections, spotless, pure; 2nd., handsome, beautiful. Now, with this brief explanation no one can be so stupid as to think it necessary that a sample exhibited should be an *average* rather than a "fair" sample. To sustain my position I have only to cite the well known fact that judges, time out of mind, have persisted in giving this requirement the same meaning which I have here ascribed to it. To comply with it, the sample of potatoes exhibited should not be procured until after the entire crop has been dug and properly sorted. During this process a "fair, handsome, beautiful" sample of the crop may be obtained. After the necessary quantity has been selected, they should be carefully washed, for they must be also free from spots, dirt, or imperfections. The exhibitor should be on hand when the committee goes around to make awards, and insist that he has complied with the letter and spirit of the requirement. Another hint may be also worth considering: If Mr. A. has a sample inferior to Mr. B.'s, then Mr. A. should suggest to some member of the committee that Mr. B.'s potatoes have evidently been sorted, and that therefore the competition is unfair. A careful attention to these few crude suggestions will probably be rewarded with success. They apply with equal force to preparing other vegetables for exhibitions. Another foolish requirement is that samples exhibited should be grown by the exhibitor. It works hardship in many cases, as, for instance, some worthy farmer has only three or four of the necessary half dozen enormous pumpkins for exhibition; he is, under this rule, debarred from exhibiting unless he can borrow from his neighbor. Now, the only way out of this dilemma is to borrow enough from some neighbor to make up the necessary number. But by no means lend the few enormous squashes or pumpkins you may have to any one. The spirit of this rule prohibits your growing vegetables of any sort to be exhibited by another. This practice of borrowing for exhibitions works charmingly in the class for fruit. I have known an exhibitor to scour a whole town to procure samples of different varieties of fruit for exhibition.

In all other classes there are numerous methods of excelling. Sheep to be exhibited should have been "stubble-sheared" months ago; lambs should be shown with ewes that have not suckled them. Ewes, to show to good advantage, should not have produced lambs during the year they are exhibited. Some little advantage will accrue from being on hand at the time the judges are making their awards and inducing them to believe that your sheep were shorn at least two months later than was the case, that the lambs shorn are twins and are two months younger than is the fact, and that the ewes exhibited all suckled twins and that said twins were weaned only a few days before the fair. At least two out of three judges will know nothing about sheep; and this is an honorable competition, and the honor consists in succeeding. Your calves and pigs should be younger than the stock of other competitors, and it is well to state this fact to the committee and also that your stock have had no extra care, and that you did not think of showing until the day before the fair. It will do no harm to be friendly with the judges. Milch cows, to show to good advantage, should have come in profit but a few days before the exhibition, and should not be milked the morning of the day on which the awards are to be made.

To the fair sex who aspire to become successful exhibitors, I would say, briefly, do not make anything for exhibition that can be bought. Why make preserves, pickles, biscuits and bread when better samples can be purchased. Some articles of fancy-work can be exhibited year after year, and thus become quite a source of profit. By a successful exhibition you establish a sort of prestige that may be useful in other exhibitions and in succeeding years.

By a close attention to these few hints and the careful elaboration of other ideas that suggest themselves to the exhibitor, a certain degree of success may be attained and a certain amount of money acquired. The one thing above all others that should be remembered is, that the honor of an honorable competition consists solely in succeeding.

St. Lawrence Co., N. Y. F. K. MORELAND.

THE EVAPORATION OF FRUIT.—NO. 4

J. G. BINGHAM.

Its Profits.

IT is characteristic of the business Yankee, previous to any investment, to make the pertinent inquiry: "Will it pay?" This question has been repeatedly asked of me in regard to the evaporation of fruits.

Before I can answer satisfactorily I must assume, first, that you have fruit-bearing orchards or can purchase fruit at reasonable prices: second, that you will with reasonable industry keep your evaporator at work; third, that your products shall be first-class and command full market prices. With these conditions, so far as relates to fruit, evaporator, product and market, I answer emphatically, "Yes." The business is now recognized as a legitimate farm industry. Rarely will any investment on the farm, or indeed in any legitimate business, pay handsomer or quicker returns. For example, 1,000 bushels of apples will yield 5,000 pounds of evaporated fruit, which is quoted in the last number of the RURAL—September 10—as worth 11 to 11½ cents per pound. The actual market value of the product of the 1,000 bushels is $550, while the value of the 1,000 bushels of green fruit at 20 cents per bushel, is $200. The value of the time occupied in paring, drying, fuel for the evaporator, etc., will not exceed $100, leaving a balance for profit of $250.

From actual tests given certain quantities of fruits, I have gathered the following: 7,000 bushels of apples evaporated by a well known fruit grower, yielded 41,645 pounds of dried fruit, which sold for 10 cents per pound, or $4,164.50: 500 bushels of Black-cap raspberries evaporated by the "Fredonia Fruit Drying Co.", of Fredonia, N. Y., made 5,000 pounds of dried fruit, which readily sold for 30 cents per pound.

Two acres of sweet corn yielded 1,800 pounds of dried corn which sold for $180; time occupied in drying, 19 days; cost of labor and fuel, $43: 1740 baskets of peeled peaches (⅝ bushel per basket) yielded, when cured, 6,090 pounds, and sold for 30 cents per pound, or $1,827. The cost of the peaches at 25 cents per basket, and of peeling and evaporating them at 16 cents a basket, was $713.40, leaving the handsome profit of $1,113.60. From practical experience in the dessication and evaporation of fruits, I am convinced that the foregoing tests are by no means exaggerated, but are about an average in quantities and prices received.

As to the important problem who manufactures the best evaporators as regards general principles and correct methods of construction, material used in them, perfection of work, etc., there is a diversity of opinion. The Zimmerman and the American Dryers, both of which are advertised in the RURAL, I have thoroughly tested by actual use, and, moreover, I have seen them used by many orchardists, and they commend themselves to the general observer in preference to large and costly evaporators, for their low price, portability, rapid and continuous evaporation, and bright, perfectly cured fruit. An evaporator costing from $50 to $75 will thoroughly evaporate from five to twelve bushels of apples per day. One costing from $100 to $200 will evaporate from 15 to 40 bushels, and larger sizes, costing $400 to $650, will evaporate from 100 to 150 bushels per day of 24 hours' continuous work. It is to be hoped that the thousands of bushels of fruits that yearly go to waste or that are converted into cider, wines and other intoxicants, etc., may, instead, be evaporated and thus yield a handsome revenue in place of loss to our orchardists and agriculturists.

In conclusion, I would most earnestly impress upon the minds of the readers of the RURAL the importance, economy and satisfactory results of this branch of farm industry. The proper utilization of the waste of fruits it would indeed be difficult to overestimate; happily the apathy of years past is giving way, and the recent progress in evaporating our surplus fruits, if continued, will place evaporated fruit among the largest items in the lists of our exports, and thus American fruit will hold a foremost place in all the markets of the world.

McGrawville, N. Y.

CRUSHED GRAIN.

THE description of a grain crusher on page 531 of the RURAL, opens up a matter I think of great importance to all classes of farmers, especially to those who feed ground food to stock, and to the other class who feed whole grain. While the former gain probably 25 per cent. by having their grain ground, they lose in another way quite as much—in the time occupied in going to mill, the charge for grinding, a little loss here, and a trifle there, that goes quite a way in balancing the gain by grinding: the other class lose their 25 per cent. outright, and probably some more.

This brings me to my query, which I trust may be discussed by other correspondents of the RURAL—why do not more farmers have farm mills, and grind their own corn, crush their oats, and, besides, "fine" the beans, peas and barley, that are fed upon the farm? To me such a machine would seem to be a great economy, not only in dollars and cents, but also in time, and would also furnish a way to prepare other kinds of feed than corn, that are not usually ground at the grist mills.

I have no experience with the crusher described, nor with steel burr mills for the farm, but for 25 years I have had an Excelsior farm mill—a huge coffee-mill, the principle being a double cone, the inside one stationary, the outer one revolving about it by means of a sweep. For all of that time I have "cheated the miller" out of his toll by grinding all my grain for stock, the sum total some years approaching 2,000 bushels; and there has been no expense in all that time, save for a pair or two of new "rings" or burrs. The speed is from 10 to 20 bushels of corn (in the ear) per hour. With this mill I grind when I wish, and always have my meal fresh. I have no three-mile journey to make to the grist mill, and often weary delays there waiting "my turn," and the "grist" is usually well ground—and no toll to pay. Crushed grains are, I am satisfied, as conducive to good results in feeding, as the fine, dust-like meal that many insist upon, and many years of rather close observation fail to shake my opinion that a kernel of corn crushed into twenty pieces is fully as nutritious as the same kernel ground into dust-like flour, so that I have, for a number of years, turned the "set" of my mill back a couple of notches and ground somewhat coarser than in the beginning. Mills adapted for farm use are not particularly expensive, and if they are used with care, they will last a lifetime. Twenty-five years' service has not detracted a dollar from the working value of my old mill; and should any of my readers chance upon my farm in 1906, he will probably see the veritable old mill grinding, slowly perhaps, but none the less fine.

JOHN GOULD.

Ohio X Roads, O.

COVERING WEEDS WITH A PLOW.

IN the RURAL of Aug. 20, I find an illustrated description of a plow arranged for covering weeds, tall grass, rye, etc. In examining it, I observed that one important part was omitted—that of having a short chain or small rope extending from the drag-chain to the plow-rung. In order to do good work, the chain should be *heavy* from the plow-beam to a short distance in front of the furrow-slice, and the links should be short, with as small spaces as possible, as the weeds and grass will not be as liable to become entangled in the chain. This invention has been patented, as may be observed by reference to the Report of the Commissioner of Agriculture for 1866, p. 244, in which is a very clear illustration.

Southold, N. Y. S. T. T.

Combined Drill and Lister.

For the last five years or more the practice of "listing" corn has been extending rapidly in the Far West, especially in Kansas, Western Missouri and Nebraska. According to Professor Sheldon, of the Kansas State Agricul-

tural College, the advantages claimed for the method are three-fold: 1, by it the crop may be made at one-fourth less cost than by the old method; 2, the yield per acre is considerably increased, and, 3, the "listed" corn stands drought better than that planted in the ordinary way. The lister, as seen in the accompanying engraving, Fig. 556, is simply a double-mold-board plow which throws the earth equally to right and left. It is usually worked by three horses, and in the furrows made by the plow the corn is drilled either by an ordinary corn drill or by a drill attached to the lister, as represented in the cut. By the use of the ordinary lister and drill a man and three-horse team can put in from eight to ten acres of corn a day, and with the drill attachment to the lister it is claimed that from 10 to 12 acres can be planted with equal ease. After the corn is planted, the harrow is used on the field till the corn is from eight to ten inches high, and then the cultivator finishes the job.

Field Crops.

TOBACCO GROWING NOTES.

The dry weather which has prevailed to a serious extent during the present Summer throughout many of the tobacco-growing sections, has led to much discouragement among tobacco growers. It has, however, served as a useful lesson to many in the way of teaching them the importance of giving soil upon which this crop is to be grown very thorough preparation. It has been generally found that upon soil highly manured and thoroughly pulverized to a considerable depth, the crop has suffered comparatively little damage, while soil improperly fertilized and otherwise poorly prepared, has failed to produce a paying crop. Another important lesson taught by the drought is the advantage gained from early setting. I fail to find an inferior growth of plants where the soil was properly prepared and the seedlings transplanted early. The early setting of plants usually secures a fair growth before mid-summer, when the excessive heat and dry weather do not so seriously affect the growth of the crop. Late tobacco, on the other hand, that does not have time to become well rooted and started by mid-summer, cannot fail to become seriously impaired during times of drought.

Tobacco growers who have found their crops greatly curtailed in growth by the drought, may do much in the way of making their product more salable by careful management. Early and low "topping" is highly important with late tobacco, as it hastens the plants to maturity, and adds greatly to the size of the leaves. In all cases, when it is possible, let such tobacco become ripe before harvesting, by allowing it to stand at least two weeks after it is "topped." In the meantime no suckers should be allowed to grow and a diligent search should be kept up for worms. It can not be expected that a small, late crop will mature as many leaves per plant as early tobacco; hence the importance of topping it low. While with seed-leaf or cigar-making tobacco, a large leaf is usually most desirable, a small leaf, if fully matured and properly handled and cured, may make a product of very fair quality.

One of the most difficult points to learn in tobacco culture is to tell when the plants are fit to be harvested. The most experienced growers are frequently unable to tell definitely when the best period of maturity is reached. It is pretty generally considered that a fully matured plant will yield a greater weight of cured leaf than one not wholly ripe, but the difficulty lies in determining the exact point at which the quality begins to deteriorate, if the crop is left uncut. I have this season allowed my plants to stand four weeks after "topping," which is longer than seed-leaf tobacco is usually allowed to ripen. I hope by the experiment to be able to demonstrate the advisability or unadvisability of allowing tobacco to become fully ripe.

A valuable property in tobacco is the resinous gum which the leaf freely exudes during the process of ripening, and which, being soluble in water, may be washed off by a heavy rainfall. For this reason tobacco should not be cut immediately after a rain. If the work is postponed for a few days after a rainfall, the leaf has time to again secrete the necessary supply of gum. Neither should tobacco be cut when wet, for if laid upon the ground in this condition, dirt will adhere to the leaves, causing damage to the crop.

It should be remembered that tobacco will dry much more rapidly in the upper portion of the curing barn than in the lower parts of the building. For this reason, and to prevent too rapid drying, which causes unfavorable results, it is advisable to hang the plants thicker in the top than in the bottom of the curing barn, decreasing the number of plants to a given space as the lower tiers are reached.

Chemung Co., N. Y. G. A. H. Jr.

RAISING WHEAT IN NEW YORK.

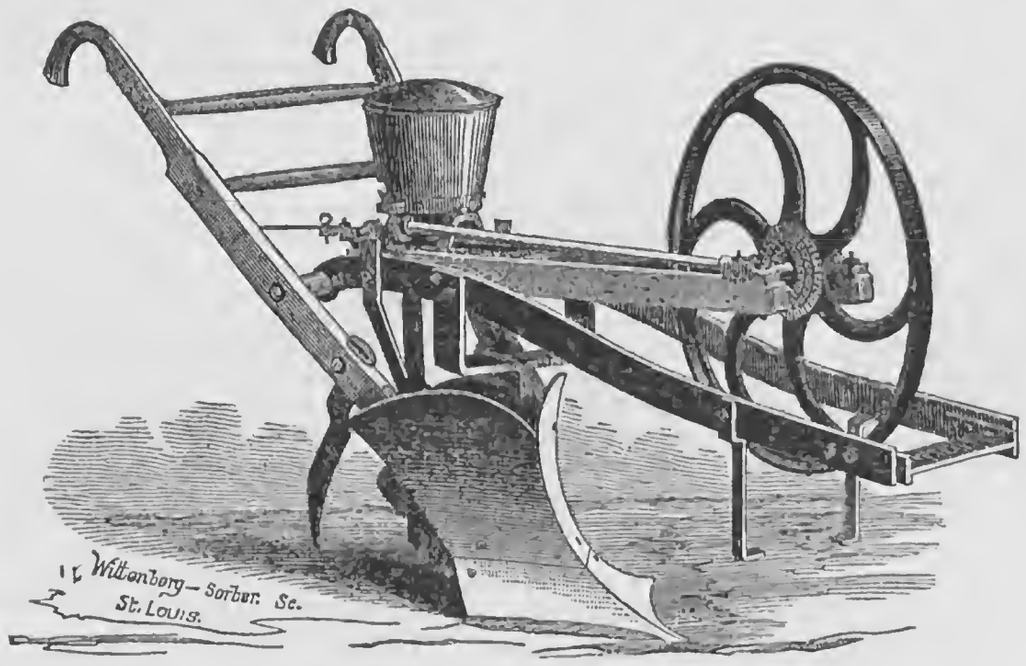
Having had 30 years experience in raising Winter wheat, I propose to give, for the benefit of RURAL readers, a few of the conditions my experience has taught me to be necessary for the production of a profitable crop. The first—and a very important one—is the thorough preparation of the soil; second, the location or situation of the field; third, the proper manner of sowing the seed. In addition to the above material points, due attention to many minor ones will aid greatly in producing a good yield.

Preparing the soil implies plowing, manuring and all work preparatory to putting in the seed. He that would reasonably expect a good return in bushels, must not expect to cheat the crop by a hurried tillage of the soil, for in so doing he is sure to cheat himself. Plow the land not to exceed six inches in depth; turn a narrow furrow from eight to ten inches in width, lapping the furrows, laying them at an angle of about 30 degrees, leaving the vegetable mold, or surface soil, exposed between each furrow. If you wish to sow broadcast, and your land is well plowed, sow the seed on the furrows and harrow it in. It will come up in drills the width of the furrows, striking the roots directly into the best part of the soil between the furrows. I prefer plowing and harrowing the land thoroughly before sowing the seed, leaving the ground smooth for a seed-bed, and covering the seed with a two-horse cultivator, going once thoroughly over it, leaving it rough. Covering it deep furnishes a better protection for Winter. One material point in Otsego County is to cover the seed to a good depth—say two inches, and sow early in order to obtain a strong root the better to withstand the hard Winters.

Now we arrive at the point of location or situation of the field. Select a dry piece of upland where snow—nature's protection for Winter—lies as it falls as nearly as may be, avoiding heavy drifting or blowing off, leaving the crop exposed to Winter's severity. Let us now examine the manner of sowing the seed, with a view to overcoming disastrous results. Shall we sow broadcast in the old style? that is, half-plow, smooth down with a harrow and sow the seed; then harrow again, leaving a good deal of the seed uncovered, and some more barely covered, to be washed out by the first shower, and at harvest time wonder why our crop is so uneven? The Western farmer says use the drill. All right; but I prefer using the cultivator—as hinted above—after having tried both, as the grain then comes up in the ridges, whereas by the use of the drill the reverse is true. It winters better in the ridges than in the hollows made by the drill teeth. I have raised 45 bushels of Diehl to the acre by operating as above, with the addition of 18 or 20 loads of manure to the acre, and think there is no more risk in a crop of wheat than in one of oats.

W. B. NEARING.

Otsego Co., N. Y.



COMBINED DRILL AND LISTER.—FIG. 556.

WHEAT RAISING IN NEW JERSEY.

We are permitted to publish the following letter addressed to a friend:—

In reply to your inquiry as to my wheat crops of last year, I sowed 36 acres—19 of which were stubble and 17 Timothy sod; variety sown, "Fultz"—about two bushels to the acre. Soil, a pretty stiff clay. Treatment: 30 acres had 500 pounds per acre of concentrated wheat fertilizer alone; 6 acres were dressed with stable manure—about ten loads to the acre, and about 500 pounds of the concentrated fertilizer. Result, 1,180 bushels and 37 pounds of wheat, and 45 tons of straw when pressed. The weather during, and for some time after, sowing was so exceedingly dry that the grain sown on the sod did not come up as evenly as that on the stubble. About three weeks before harvest the Army-worm entered the field and marched directly across it, stripping the leaves from the stalks and cutting off the smaller heads. The quality of the wheat was good, weighing 62 pounds to the measured bushel. The Army-worm did considerable damage—just how much I am unable to say. The yield from the 19 acres of stubble was estimated—the two plots not being separated—40 bushels to the acre. The wheat on the sod piece came up unevenly, and, as a result, the yield from this piece reduced the average yield considerably. The grain from the two pieces was harvested together, and when thrashed was accurately measured and weighed.

W. S. Combs.

Monmouth Co., N. J.

Every farmer with whom we have conversed, that has tried both Fultz and Clawson and *measured the yields*, prefers the Fultz. It is not surprising that those who have *not* measured the yield should hold that Clawson is the heavier yielder. The reason is that the grain is larger, the heads more spreading, presenting a heavier, fuller appearance. The truth is, however, that though the single grain of Clawson is heavier than the single grain of Fultz, the average head of Fultz is heavier than the average head of Clawson, owing to the fact, which we have several times alluded to, that the spikelet of Fultz bears one more grain that the spikelet of Clawson.

WASHINGTON AND GHALLENGE OATS.

In the RURAL of August 6, G. C. asks in regard to oats, "What's in a name?" and referring to the Washington Oats, says: "I have grown the Washington Oats, and about half the yield is smut." G. C. also says, "I have grown the same oats for years, having got them from the Department of Agriculture first, and afterwards I bought a bushel from B. K. Bliss & Co., of N. Y. City, under the name of English Challenge Oats. Having compared all, I know they are identical." I would like to ask G. C. if the Challenge Oats were about half smut as grown by him, also if he has grown the Washington Oats for years, as he says he has, and they were about half smut, why does he keep on growing them? I have grown the Washington Oats the past year, also for two years past the English Challenge Oats, purchased of Messrs. B. K. Bliss & Sons, and both myself and my son think them different varieties. We thought so soon after they came up, and, though both sorts were sown with a drill in the same field, at the same time, yet the appearance was decidedly different to our eyes at, and since, harvesting. The Challenge Oats, too, were the earliest to show their heads and first to ripen. They were also entirely free from smut this year as well as last, while there was some smut in the Washington; but these were not nearly so badly affected as G. C. represents his to have been.

Either G. C. is mistaken in saying, "he knows they are identical," or myself and my son are not observant enough, or perhaps one of us may not have the genuine Washington Oats. Who can decide the question correctly? We had the Washington, White Russian, White Schœnen, and Challenge Oats, all growing in drills about 40 rods long, in the same field. The difference was very perceptible in the appearance of each sort; the Challenge were the first to ripen; the Washington and Schœnen ripened about the same time, and the Russian last. What say other cultivators? Are the Washington and Challenge identical? If so, I did not get these varieties true to name, or have not watched them closely enough; for my observations of them this season very decidedly prevent me from believing that they are one and the same variety under different names.

Rome, N. Y., Johnathan Talcott.

Entomological.

THE LOCUST SAW-FLY.

There are many reasons why the Locust or Black Locust, as it is sometimes called (Robinia Pseudacacia), would make a desirable shade tree. The graceful foliage forms, when the tree is healthy, a symmetrical top, and in the Spring this is covered with a profusion of

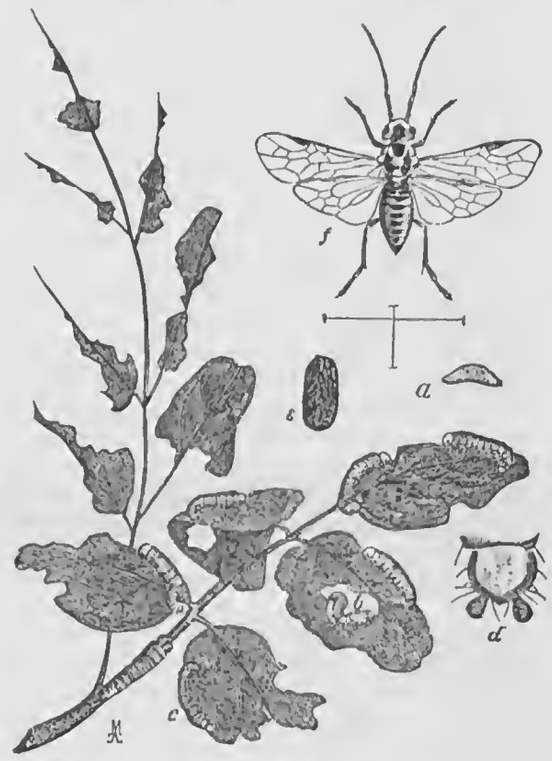


FIG. 557.

flowers that may be admired for their fragrance as well as their beauty. But we have, perhaps, no tree that is more subject to the attacks of insects. The trunks and large limbs are yearly channeled by the larvæ of the Hylentes Robiniæ, a moth, and Clytus Robiniæ, a beetle, which render the trunk unsightly and cause the death of many of the limbs, and perhaps a premature dropping of the leaves.

Besides these, the leaves are eaten by the larvæ of a butterfly and a moth. The recent investigations of Prof. Comstock, late Entomologist to the Department of Agriculture, add one more to the list of insects that seem to conspire against the life of this tree. This is a saw-fly or hymenopterous insect related to the imported currant worm or saw-fly, the raspberry slug and many others that might be mentioned. One feature of the work of this group of insects is that they multiply rapidly, so that they soon swarm on the plant that constitutes their food. I have seen clumps of willows perfectly denuded of their leaves by another species of Nematus, the stems being as bare as though it were Winter. The accompanying cut, Fig. 557, will give an idea of the manner in which these insects work.

The Locust Saw-fly (Nematus simelaris) is a small, four-winged fly, the body being nearly a quarter of an inch long and the wings expanding a little more than half an inch. The body is of a dirty yellow color, with black spots on top of the head, and on the thorax and abdomen; but the wings are transparent. This insect deposits an egg in a crescent-shaped slit made in the under surface of the leaf, and the egg is secured in its place by fastening together the cut edges. When it hatches, the young larva at first feeds upon the portions of the leaf where it finds itself; but it soon leaves the center of the leaf, going to the outside, where it eats the tissue of each leaflet from the edge to the mid-rib. The young larva is pale, greenish-white, with a brownish head, but the mature one is a more distinct green, with the head yellowish-green and the eyes black, with pale centers. The only other markings that are prominent are dusky spots below the stigmata or breathing pores on the first six joints.

These pests grow to be about two-thirds of an inch long, and may readily be known from caterpillars or the larvæ of butterflies and moths, by their having ten pairs of legs, while caterpillars never have more than eight pairs. Also, they have a habit of curving the hind part of the body round when walking. There are said by Mr. Comstock to be two if not three broods in a season, the first pupating in loose cocoons hid among leaves, grass or other rubbish; but it is probable that the last brood pass the Winter in the ground in their cocoons, as this seems to be the habit of several other species of Nematus, and, like the apple worm, or larva of the codling moth, they, or the species I have observed, seem to remain larvæ until Spring; then they change to pupæ a short time before the fly emerges.

Prof. Comstock says he has bred a parasite from them, which shows that nature has pro-

vided a means of partially, at least, checkiug their ravages. Paris-green put into water, and thrown on the tree with a garden syringe, would be the most effectual remedy, though it is possible that dusting the tree with lime while the dew is on would destroy them. G. H. FRENCH.

THE NORTHERN OHIO FAIR.

Cleveland, Ohio, Sept. 7-81.

The Northern Ohio Fair opened Monday, Sept. 5th, with one of the hottest spells that it has been my lot to endure. Monday the thermometer stood at 98° in the shade: Tuesday at 102°: Wednesday at 97°—and then I left. The display was probably put back somewhat by the great heat. In the cattle depatment there was not much more than one-half of what former years had brought forth, and the cattle shown appeared to a great disadvantage on account of the extreme heat. Good herds of Devons, Shorthorns and Holsteins were exhibited, but they suffered so much from the torrid weather that they did not attract the attention they otherwise would have done. The exhibits not only of cattle, but of sheep, swine and poultry were unusually light. The display of cut flowers was fair, but that of foliage plants was the best feature of the show, the residents of Euclid and other Avenues having thrown open their handsome grounds to help along the exhibition. All the principal general species and varieties of flowers were shown, flanked by a splendid assortment of plants put in by the nursery-men of the vicinity. I do not remember to have ever seen a handsomer exhibit in this line. Domestic Hall was fairly supplied, but the range of exhibits was limited. The display of vegetable and garden products, though fine, included nothing very rare or novel.

In agricultural implements the display was about medium. Right here could be noted one of the effects of the disastrously droughty season—only one or two steam thrashers and engines could be seen, the light harvest having driven these exhibits out of market in this region. Self-binders from all sections, were displayed, as these implements from being strictly Far-West machines, are gradually finding their way into all of our Eastern grain-raising sections. I particularly noticed the Walter A. Wood, Osborne, Esterly and others in full operation, showing the farmers the relative values of twine and wire-binders, and also the ease with which both kinds can be operated. Here also could be seen all the principal grain drills, plows and other labor-saving implements, although not in such a great variety as might be seen if the short-sighted policy of the Northern Ohio Fair Association had not discouraged agricultural exhibits. This Society still continues to make a point of collecting a crowd by means of horse racing, ball matches, bicycle races, etc., all of which distractions, of course, tend to draw the farmer and his family from the legitimate exhibits of an agricultural fair, and thus to disincline exhibitors to incur the labor and outlay needed to make a fine display. The moment the bell rings for a race, off goes every one and, so far as I can see, and I have studied the matter thoroughly, this demoralizing feature of agricultural shows serves as an excuse for the otherwise religiously inclined farmer, to attend a horse race without running the risk of hurting his conscientions scruples or of being read out of church or meeting-house.

The Eureka Mower Company, Towanda, Pa., in addition to their general line of well known mowing machines, showed their new eight-foot mower. This machine was placed in the field for the first time last season, cutting a swath of eight feet with ease. It is now the widest-cut mower made, and, as it can be used with an ordinary team of horses, it promises to be a very popular addition to the labor-saving implements of the country. I met W. I. Chamberlain on the grounds, and he says that he still holds to his oft-repeated indorsments of the Eureka.

W. H. K.

Miscellaneous.

RURAL BRIEFLETS.

F. D. S., Ithaca, N. Y. asks if Fultz ought no to receive a special premium. "While the heads may not be as large, it out-yields all other kinds and is fast displacing them."....

THOSE of our readers who may have thought the RURAL severe upon the New-Dispensation-Ensilage-Winning-Billerica man should have read some of Sec. Chamberlain's articles respecting him and his book printed in the Ohio Farmer. We hoped Mr. Chamberlain would have touched upon his appropriation of our cut of Blount's Corn as *his* Ensilage Corn. But this escaped Mr. Chamberlain.....

MANY thanks to our friend Mr. Garber who sends us by mail a head of the Rural Branching Sorghum (Aug 12). It is eight inches long and the seeds are large and fully ripened. So it will appear that by following Mr. Garber's instruction (sowing a few seeds early in pots and keeping them under glass) it is easy to raise all the seeds needed for sowing.....

AMONG our wheat specimens we found two panicles of oats sent to us from a subscriber in Colorado, whose name does not appear. The larger of these panicles measures 18 inches in length and bears 320 spikelets, many of the spikelets containing three grains. This is the heaviest panicle of oats we have ever seen. Should this note meet the eye of the sender, he will kindly state the variety of oats and oblige us with a statement of the yield per acre.....

THE Ag. Ed., of the Sun says that "under favorable conditions the roots of Red Clover live for many years" as he has *often* proved by practical experiment? Might we ask *how* often?.....

IN another part of his reply to the editor of the N. Y. Times, he says that all who have had experience with Red Clover will coincide with Dr. Gray, viz., that it is a "short-lived perennial!" Therefore we must conclude that "a short-lived perennial" is a plant that "lives for many years." It would have been more manly had the Sun editor frankly acknowledged that his attack upon the Times editor was a blunder, instead of attempting to smooth it over by an evasion of the exact question at issue, in a feeble defence.....

EVEN Quack has yielded to the drought and is now brown. But one kind of grass on our uplaud fields is yet green, and that is Bermuda Grass. This is just as green as when there was plenty of rain, and is growing at a rapid rate: from one-and-a-half to two inches every 24 hours—we mean horizontally; it grows in hight only from six to ten inches....

OUR Alfalfa which was sown with oats, germinated freely and reached a hight of six inches before it was overshadowed by the oats. Then the leaves turned yellow, and when the drought commenced only the slender stems remained, which we supposed were dead. After the oats were cut the stems put forth new leaves, and at this time (Sept. 3rd), notwithstanding the almost unprecedented drought, the Alfalfa plants are still alive Seed at the rate of 120 pounds to the acre was sown. Upon another plot Orchard Grass (at the rate of 80 pounds to the acre) and Alfalfa (at the rate of 20 pounds to the acre) were sown with oats. The Orchard Grass now forms a mat of dry leaves; but the Alfalfa plants are to be seen here and there with slender stems and scanty foliage.....

THE Achania malvaviscus is a plant that we can heartily commend to all, especially to those farmers' wives who have only a sunny window in which to keep their plants during the cold months. We have trained it up the side of our conservatory as if it were a vine, and its brilliant, scarlet flowers are constantly blooming. As a bedding plant it is also pleasing, though it needs a considerable space, as its growth is rapid. This plant may be especially commended for its endurance of dry weather, and it is, therefore, well suited to rock-works or beds in close proximity to the dwelling, exposed to a southern sun. We have never known it to be infested with insects, and in every way it renders a full return for the little care it requires.....

MR. STONE, from Cuba, N. Y., sends us several heads of Russian White Oats, which are among the finest we have seen. He says: "The oats are a decided success in this section. There was no rust or smut whatever on them, while other sorts rusted and "smutted" badly; of the Washington Oats, one-third of the heads were smut."....

WE have received the following instructive letter from Mr. J. B. Garber, Columbia Co., Pa., alluded to above:

"I mail you a small package of heads of the Rural Branching Sorghum. My object in sending them is simply to show how easily the seed can be grown. As I stated to you once before, I started a few seeds in a pot early in March, and planted out three plants after danger of frost was over. These three plants each shot up three stems about five feet high, with seed heads now ripe. Then sprouts or suckers grew up, some six to eight from the roots of each plant. These suckers are now about four feet high, and all are pushing out seed heads which will also ripen their seeds, unless an early frost should cut them down. Thus you see I am pretty sure of having a quart of seed, and if the suckers ripen their seed, I may have half a peck of good seed — perhaps more. Now I might just as well have grown 100 or 1,000 plants in the same way, had I desired to do so, as three plants only, by starting the seeds early."....

WE have the ordinary Lima growing in one part of the Rural Farm and the Challenger in another. The latter will bear twice as many beans as the former and of a larger size. This bean will, we are confident, be found a valuable acquisition.....

THE engraving of the Rural Dent in the Fair Number is from life, and only an average of the best ears.....

WE have an ear of the Rural Thoroughbred Flint that measures precisely 15 inches in length.....

THIN SEEDING OF WHEAT.—At a recent meeting of the Elmira Farmers' Club, Mr. G. W. Hoffman remarked that he had cut part of his wheat and thought it revealed a lesson worthy of thought. He drilled one bushel of Heiges's wheat at the rate of three pecks to the acre, and then set the drill to distribute four pecks, and drilled another acre alongside. He said he would be glad to have members of the Club visit the field and show him any difference in the crops of the two plats, and to say whether they thought the stand thick enough or not. Mr. Hoffman thought the wheat as thick as could be desired. Close alongside he drilled Clawson wheat at the rate of three pecks to the acre, then one acre with four pecks, another with five, and the difference was not perceptible.

"I DON'T advocate thin seeding as the general rule," says a writer in the Husbandman, "because I know that not one field in ten is well fitted. Get that condition and anything beyond three pecks is thrown away. I want it understood that when I recommend thin seeding it comes after thorough fitting. Got that fact well in mind—attend to the fitting—and there is no earthly use of distributing seed that won't have room to grow. But it's of no use to talk about it, for nine farmers out of ten think they know better. They will go on sowing two bushels of wheat, or three of oats, because they can't persuade themselves that any less may bring a full crop. I have seen wheat this year as thick as I want to see it, and only three pecks of seed were used on an acre. But, mind you, the land was in good order.

SCIENCE AND THE FARMER.—Macmillan's Magazine says that there is an urgent need in England, as in other countries, of scientific investigation as distinguished from mere empiric trials, of sustained inquiry as distinguished from scattered and fitful experiments into the relation of soil and crops, of beasts and food, in order that the tillage of the land may, like the practice of other professions in which man has to struggle against nature, expand with increasing insight into the laws of nature instead of being hampered by blind obedience to traditions and narrowed by timid experience. There is no less urgent need that the practical farmer should be so far trained in science as to be able to make an intelligent use of the advantages which science offers him, as well as to be able to avoid the snares which false science continually spreads for him.

WHEN TO CUT WHEAT.—Mr. Henry Stewart says in the N. Y. Times, that there is a difference of opinion in regard to the best time. Some advocate cutting early and when the grain is still soft; others would leave it until the grain is fully ripe. As usual in such cases, the truth lies between the two extremes. If the wheat is cut before the grain solidifies and the starch is fully formed, it will undoubtedly shrink; if it is left until the grain is hard, there will be loss by shelling. If the wheat is cut when the grain is solid, but yet soft enough to be crushed between the thumb nails, there will be neither shrinking nor shelling. It is supposed that as soon as the straw turns yellow no more substance is derived from the roots, and that the crop may be cut without disadvantage, as what is in the straw will go into the grain. This is easily seen to be erroneous, because as soon as the straw is cut, when it is not ripe and dry, the absorption of moisture from the roots required to replace any that the grain may take from the straw is arrested; the straw itself dries and is likely to draw something from the ear, and so cause shrinking of the grain in either case.

"AN English farmer reports cutting three lots of wheat at different stages of maturity—in the milk, in the dough, and fully ripe. He thrashed separately, and had one hundred pounds of each carefully ground and the results weighed. The one hundred pounds of wheat, cut in the milk, made seventy-five pounds of flour, eleven pounds shorts, twelve pounds bran; that cut in the dough made eighty pounds flour, five pounds shorts, thirteen pounds bran; that cut fully ripe made seventy-two pounds flour, eleven pounds shorts, fifteen pounds bran; two pounds lost by milling in each case. This shows the dough state made most flour, and the ripest made the least flour and most bran." Bran is made at the expense of flour, by standing late.

MR. Curtiss, in his pamphlet on wheat culture, favors early cutting except for seed. He mentions several important advantages, and several minor ones, to be secured by cutting wheat when it is passing from the milk to the dough state, viz.: It largely prevents injury by rust, as rust ceases to affect the grain as soon as cut. It gives more and heavier grain. It gives more and better flour to the bushel, as all the time the grain stands after the dough state, it makes bran at the expense of starch and flour. It causes less waste by shelling and scattering while harvesting and handling. And last, the straw is tougher and softer to handle.

THE Ohio Farmer, remarking upon the above, says that while some of the reasons are well founded, the statement that early-cut wheat makes *better* flour than that cut later, is a hasty one, made without examining both sides of the question. Whiter flour does not mean better flour. Mr. Curtiss may not intend to convey the idea that the starch in wheat is no part of the flour, but his language means that, when he says that all the time the grain stands after the dough state, it makes bran at the expense of starch and flour. The statement is not altogether true, for gluten, the material needed, forms largely after the milk stage. If rust strikes wheat, it is useless to wait for it to ripen; the sooner cut the better.

EXPERIMENTS at the Ohio State University go to prove that the practice of cutting wheat before it hardens reduces the quality. It appears that the gluten is two or three days slower in forming than the starch, and when cut in the milk stage, the amount of gluten is materially diminished. The grain may be plumper, and the flour whiter, of this early-cut wheat, but it will be deficient in bread-making quality, and in the kind of nutrition a farmer most needs. This is especially true, the Ohio Farmer goes on to say, of the soft wheats, like Clawson, and hence, for home use at least, such should be left standing as long as possible to secure it without shelling. Prof. Townshend, in one of his lectures, says the old Mediterranean is the best wheat for bread that he has any knowledge of. It does not make as white bread as some others, but quality is above mere color. He suggests that, as it has a larger kernel and does not tiller as much as some others, more seed should be sown than usually is. In his own experience he found that sowing two or three pecks to the acre more than usual, secured a substantial increase in the yield. He also suggested that a dry, sandy soil, and the use of phosphates, increased the per cent. of gluten. The drier the soil and climate the more gluten will wheat contain.

A BLOW AT SOFT WHEATS.—The Pioneer-Press of Minnesota says that a farmer living in Anoka, brought down to the Minneapolis mills the other day, a load of Lost Nation wheat for sale. To his surprise he could find no purchasers, and after going around among the different mills, he was obliged to haul it back home. This statement which was published in one of the Minneapolis papers, shows that the millers mean business in their declarations against soft wheat. If they cannot control the actions of the soft wheat growers, they can at least refuse to buy their wheat. But we opine that if the present healthy agitation is kept up, buyers in other places will not be so ready to handle it as they have been. A few years since the milling interest required soft wheats: but the patent middlings process has entirely changed the relative values of hard and soft wheats. It is wise for the farmer to note the difference.

CRANBERRY RAISING.—We commend the following, from the transactions of the Mass. Hort. Society, to everyone intending to cultivate cranberries: John B. Moore said that he once thought of going into cranberry culture, but before doing so he went down on Cape Cod and looked into the subject thoroughly, traveling over the Cape on foot. The conditions for this crop are not right in one meadow out of 200. There are two insects which are very injurious to it; one eats the vines in June; the other gets into the fruit in August. Neither of them can be destroyed except by flooding. If the water stands on the vines in a warm day in Summer, the fruit rots, and therefore the water must be let on and drawn off very quickly. Away from the sea-coast, cranberries are liable to injury by frosts in Autumn, from which they can be protected only by flooding, and the water must be drawn off the next day. Mr. Moore said that he came back from the Cape wiser than he went.

SELECTING SEED WHEAT.—We are gratified to see that other journals are beginning to place before their readers the importance of selecting wheats which bear three instead of two grains to a spikelet. We have long been of the opinion that there is room here for a great increase in the yields of wheats, and it seems a matter to which little if any consideration had previously been given. We find the following in the N. Y. Times, the agricultural editor of which carefully examined our many varieties during the past season: "There is wheat and wheat. Two fields alike in every respect may vary greatly in yield by reason of the kind of wheat grown. One may be very short in the head and the other twice as long; in one the spikelets may be very loosely placed on the rachis or stem, and the other may have them more crowded. In some kinds of wheat the spikelet has three grains, frequently the central floret is empty, and instead of three grains there are but two in each spikelet. This makes a difference of one-third in the yield of the crop in favor of the completely filled spikelet. But let us go further. We find in one head, which is short or loosely put together, but six or seven spikelets on each side, and in another as many as twelve or even more. This makes another great difference in favor of the better variety of wheat. We then count up the grains, and in the one head we find 24 or 28 grains and in the other 72, or even as many as 90 in extra-large and well-filled spikes. If one, then, yields 15 bushels of grain per acre, the other would yield 45. And this cause of difference is extremely common, and any farmer can know how it is himself by merely examining the wheat in different fields, or the different heads in the same field. We take time and space only to observe here the importance of making this characteristic of the wheat plant the principal basis in selecting seed rather than the size of the grain, although this is also an element not to be ignored. Let the seed be selected in the field from the longest, most compact, and best-filled heads, and let this method be pursued each year. It will lead to a great improvement in varieties of wheat."

OHIO BUTTER INSPECTION.—Robert Orr, Superintendent of the newly-created office of butter and cheese inspectors in Ohio, in a circular to his subordinates, says: "When butter is properly churned, both as to time and temperature, it becomes firm with very little working and is tenacious; but its most desirable state is waxy, when it is easily molded into any shape, and may be drawn out to considerable length without breaking. It is then styled gilt-edged. It is only in this state that butter possesses that rich nutty flavor and smell, and shows up the rich golden yellow color, which impart so high a degree of pleasure in eating it, and which increase its value manifold. It is not always necessary, when it smells fresh and sweet, to taste butter in judging it. The smooth, unctous feel, in rubbing a little between the finger and thumb, expresses at once its rich quality; the nutty smell and rich aroma indicate a similar taste, and the bright, golden, glistening, cream-colored surface shows its high state of cleanliness. It may be necessary at times to use the trier, or even use it until you become an expert in testing by taste, smell and rubbing." The bill which created these inspectors is part of the movement against adulterants. It provides for the inspection of butter and cheese, "and all the substances having the semblance of butter and cheese," and of dairies and other places where milk is sold or butter and cheese manufactured; this is to be done by inspectors appointed by the State Board of Health.

MR. D. S. CURTISS says: The object of the farmer should be to increase the product, improve the quality, and decrease the cost per bushel.

IF a farmer has ten acres of land it is so much invested capital, and if by judicious culture he obtains from it three hundred bushels of wheat each year, instead of only one hundred and fifty bushels, it is so much increased income for the capital invested.

FARMERS would, in the long run, be the gainers if they would each year gather with the grain cradle and thrash by hand with flail on a clean barn floor, sufficient wheat for seed, selecting the best growth in their fields, and letting it stand until perfectly ripe, taking that which seems to be earliest in ripening. When ready to plant, soak the seed six to ten hours in brine, and roll in plaster to dry it for the drill.

LUCK.—The gifts that luck is supposed to shower, sensibly remarks the Herald, are always to be found in possession of people who have strong arms, clear heads or busy fingers, and he who can combine all of these desirable qualities is among the luckiest of men. The man or woman who is always unlucky is the one who always is blundering, either stupidly or lazily. The best "luck" that can fall upon any impecunious young man is a determination to go to work, even if his only chance is to handle a shovel on a railroad track, and the young woman who is sighing for a rich husband will strike luck when she makes up her mind to use exercise and fresh air as cosmetics, try a new cooking recipe every day and read something sensible in some of her spare moments. Luck, as usually worshipped, is the god of the lazy and but little, if any, more respectable than Mercury, the god of thieves.

THE Pall Mall Gazette says: "Now, as to the fact that America is outstripping England in wealth, who will be at pains to deny it? It is so, and it must be so. Not the maddest commercial policy on her part or the wisest on ours could in the long run outbalance the immense preponderance of natural resources on the side of America."

SALT ON WHEAT.—As we learn from the Indiana Farmer, Mr. James McMurray, of Hendricks Co. Indiana. made careful experiments to ascertain the effect of salt on his wheat land, sowing 500 pounds per acre on the poorest part of the field and leaving the rest and better portion without this or any other dressing. The result was that the wheat on the salt-sown land was slightly plumper than that on the rest of the field, making a difference of about two bushels to the acre in weight in favor of the salted portion. The salt-dressed crop matured five days sooner than the other and no weeds were found in the stubble.

ROSES AND CULTURE.—Thus, concludes the Gardeners' Chronicle, of London, the trade in roses is sure to prove a growing one, and to keep pace with the growth of wealth, intelligence and culture. In regard to the latter the rose is likely to exert a powerful influence, for if it be true—and it is—that men become assimilated to the objects of their pursuits and affections, surely close companionship with the rose will form a center of sweetness, a source of light, to many, and a refined and ennobling pleasure to all.

TOMATOES.—A clever writer has declared that in the eating of tomatoes lies the hope of the human race for deliverance from liver complaints. This should be good news alike to unfortunate sufferers from the ills to which the liver is heir and also to growers of the tomato. We (London Journal) may be pardoned for thinking that this assurance is a little exaggerated, and that, further, it is not probable that because of the discovery medical men will have to shut up shop. If but one tithe of the virtues found or said to be found in various fruits or compounds were genuine, death should long since have become unknown to us, and the human race should be enjoying the felicity of living in perfect health and beauty forever.

OPINIONS upon practical agriculture should never be formed from books and papers alone. They are excellent for suggesting ideas, and for comparing notes with our own practice. We may be able to indorse the opinions at sight, but, generally speaking, new practices should be verified upon our own lands before we either adopt or indorse them.—[Credit lost.—EDS.] . . . . . "IS IT at all to be wondered at," asks the Telegraph, "that the exhibits of farm products at our Agricultural Fairs should show a falling off year after year, as is clearly perceptible, when the premiums upon them bear no proportion to those given for horses, trials of speed, foot-races, bicycle races, and other things that have next to nothing to do with farming and are of a nature to draw public attention from the real purposes for which these exhibitions are ostensibly established? A majority of farmers cannot afford, or are at least unwilling to spend, money and labor in preparing for these fairs their choicest products and samples of their leading crops, with no chance, from the meager premiums offered, to repay them even in a very moderate degree." . . . . . MRS. HENRY WARD BEECHER, a good authority on domestic economy, says that ten pounds of the toughest kind of meat may be made very tender by soaking seven hours in three quarts of water acidulated with a little more than half a pint of vinegar. Then wash, wipe dry, and cook as desired.—N. Y. TRIBUNE. . . . . Our friend, the Detroit Free Press, wonders why colored ladies do not wear bits of white court plaster on their faces and become perfectly bewitching. . . . . An old gentleman at a horticultural meeting in New York rose and left during the reading of an essay on the causes of pear blight. He said the essayist admitted that he had nothing new to offer and he had heard the old fifty times before. Professional essayists do greatly detract from the life of such societies. . . . . "No part of the earth, no matter how rich it may be, is available for plant use unless it is finely pulverized."

A YOUNG bride, being asked how her husband turned out, replied that he turned out very late in the morning, and turned in very late at night. . . . . .

THE editor who saw a lady making for the only empty seat in the car, found himself "crowded out to make room for more interesting matter." . . . . . .

THE Burlington Hawkeye makes the following important prediction:—

If the corn husks are very thick, the Winter will be colder than the Summer.

If the corn husks are very thin, the Summer will be warmer than the Winter.

If the corn husks are neither too thick nor too thin, the Winter will be cold and the Summer will be warm. . . . . .

WHEN we are sick we are willing to be very religious, but when we are well we prefer to do as we please. . . . . .

YOU can't get peace of mind out of evil doing, or, as the old proverb runs, you can't take a cow from a man who dosen't own one. . . . . .

To talk about virtue when you are not virtuous yourself is like giving a man a check when you have no money in the bank. . . . . .

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

POTEAU, Scott Co., Sept. 1.—We are having the longest and severest drought since '73. Crops in some parts of the State will be nearly a total failure. Here, on the "Nation" line, they are the best—about half the average. Prices are about as follows:—Wheat, none in the market; oats, 50c.; corn, 50c.; bacon, 10c.; flour, $3.50 per cwt.; butter, 10c.; eggs, 10c. per dozen. H. C. B.

GREENWOOD, Sebastian Co.—Wheat did well this season on the bottoms; a light crop on the uplands. The yield on the former was from 20 to 30 bushels to the acre, and on the latter from 5 to 10 bushels per acre. The varieties chiefly sown are Blue Stem and Mediterranean. Oats were an entire failure. The common red and black oats are usually raised. Corn is nearly an average crop. Blount's Prolific takes the lead and yields from 50 to 80 bushels per acre without manure, and with common cultivation. The outlook for orchard and small fruits is unfavorable. The Spring was too cold and backward for any reasonable chance for any kind of fruit. Such a failure in fruit was never before known in all Western Arkansas. The Summer has been very dry and hot, water *very* scarce, causing a diminution of stock, especially hogs. Cotton will not be one-half a crop. New bales are selling from 13c. to 22c. Splendid time for digging wells and gathering corn and peanuts. R. R.

Michigan.

BIG RAPIDS, Mecosta Co., Aug. 31.—Wheat has turned out better than was expected; average yield about 11 bushels per acre, and oats about 35 bushels per acre. Potatoes will be about half a crop; corn ditto. This shortage is owing to the hot, dry weather through the latter part of July and first half of August. Fruit, as a general thing, is scarce, though I shall have a good crop of apples. All the seeds I received from the Free Distribution have done well. My wife is highly pleased with the carnations and pinks. The asparagus is doing finely. The R. B. Sorghum goes beyond all expectations; it is 10 feet high and there are from six to eight branches from a single seed. The W. Oats rusted, but made a big growth. What I am more pleased with than all else is the W. E. Potato. The tuber received weighed about two ounces. It was cut into 14 pieces and planted, May 2, an eye in a hill. It had the same culture as my other potatoes. I dug them on August 16; the yield was 68 large tubers and five small ones: weight of the whole 38½ pounds. The Cuthbert Raspberry fruited this season; I consider it a splendid variety. I. W. C.

Illinois.

CHAMPAIGN, Champaign, Co., Ill., Aug. 25—A drought beginning early in July, and extending later from the Rocky Mountains to the Alleghanies, holds now its dread dominion over us. In North Illinois the drought makes things uncomfortable; in the central part of the State it has reduced a small corn crop one half, and cut pastures short, so there will be six or seven months' feeding, instead of four or five, while in the Southern counties everything has been almost literally burned up, the people having little or nothing to fall back upon but less than an average crop of oats or hay. In towns more than half the wells have given out, and in the country, in some ill watered counties, half the farm force has to be expended in digging new wells or clearing out old ones. Compared with this time last year, potatoes are $1 per bushel, against 35c.; and apples 75c.@$1—against 20@25c. Last year wheat sold for 83@85c.; corn, 31@33c.; oats, 20@22c.; and rye 60@63c. This year wheat is $1.20@$1.25; corn, 52@55c.; oats, 33@35c.; and rye 90@95c. There is almost no fruit crop, and as for vegetables, there scarcely is shame in the price of potatoes. Very good cattle are worth from 6 to 6½c., and hogs only half a cent less. While there are to-day some signs of rain, and we may and probably shall have a fall of three or four inches in course of this month or the first half of September, the Fall is pretty sure to be a dry and long one, and a very severely cold and snowy Winter is pretty sure to follow. B. F. J.

CRUB ORCHARD, Williamson Co.—The Washington Oats were sown March 18th in drills. The seed all germinated and without any extra cultivation yielded nine-and-a-half pounds of clean oats; and with the exception of the smut heads they were the finest oats ever raised in this community. The Rural Branching Sorghum was sown April 12; the seed germinated well and the stalks made a rapid growth when once started. They grew to a hight of upwards of seven feet, although damaged somewhat by a drought. [It seems to us best to cut this to the ground when five or six feet high—the second growth seems more rapid than the first. Eds.] I do not believe seed will mature in this climate; this is the only objection against it here. I have several hills with 12 to 15 stalks in a hill and in none is there less than five. The White Elephant Potato was cut into 14 pieces with an eye to a piece; 12 of the pieces germinated: but the yield will not be large on account of the dry weather. The asparagus was planted April 12; the seed did not germinate well; but about half came up. The picotees and carnations I planted too early and therefore they did not do as well as they might if planted at the proper time. B. F. D.

Iowa.

ATLANTIC, Cass Co.—Weather hot and dry. Many days the mercury is 102 ° in the shade. No rain for over two months, only one little shower that barely laid the dust. Crops badly dried up. Much wheat not cut because it was so poor, and potatoes very scarce at $1.50 per bushel. H. R. R.

CHARITON, Lucas County.—So far as I have been able to ascertain from observation and inquiry, the present crop prospects are about as follows, with slight variations in the different parts of the county:—Spring wheat almost an entire failure, with the exception of an occasional good field. The rye crop was good and is yielding well. Rye affords splendid pasture for cattle in the Winter and Spring, and then will make a splendid crop besides. The oat crop was generally good, but does not yield as many bushels per acre as was expected. But little Fall wheat was sown, and that little proved comparatively a poor crop. The flax crop heretofore in favorable seasons has done splendidly, but this season it only promises to be fair to middling. Corn which in the past for many years has been the farmers main crop, will certainly be light, owing to the protracted dry weather, which still continues with little or no prospect of rain. It is 36 days since a good heavy rain visited this immediate locality. On August 20 quite a respectable shower fell which was better than none. The water in sloughs, branches, and ponds has mostly evaporated, and in many instances these reservoirs are entirely dry, so that stock not unfrequently suffers in consequence. Timothy, millet, Hungarian, etc., are good this year, so there will be no scarcity of hay, as was the case last year. The apple crop will be very light in this section, while grapes and other small fruits have been, are, or will be good. Lucas County is composed of 12 townships, making an area of 384 square miles. Each township is well watered by one or more of the many streams by which the county is traversed; in fact, it is one of the best watered counties in Iowa. It is also well drained, being situated upon what is called the great water-shed of the State. Coal is found here in abundance, Lucas Station and Cleveland being the two largest banks. J. W. W.

Kentucky.

CARLISLE, Nicholas Co.—The weather here is very dry. The ground has been too wet to plow only once since May. Stock water is very scarce. Wheat is of good quality; average about the same as last year, mostly Fultz. Corn will not make half a crop; there will not be over five bushels to the acre, I should think. Very few oats, and of rye still less. Hay cut short owing to dry weather. There are a good many apples, but they are of poor quality. Very few peaches and plums. Vegetables are very scarce: potatoes not over half a crop. This has been a bad year for the Rural seeds. I planted half a dozen hills of the W. E. Potato in rich, red soil; dug them July 29; they weighed 3½ pounds. I gave a portion of R. B. Sorghum to a friend and planted the remainder in the same soil as the potatoes, and I have nine hills with nine stalks to the hill. The flower seeds all did well. The carnations and picotees all bloomed nicely. C. W. R.

OSHTEMO, Kalamazoo Co., Aug. 31.—The drought holds with us unbroken save local showers of not much extent or value. Feed dried up. Potatoes ditto, with a prospect of high prices for that esculent the coming year. Apples and pears scarce and poor in quality. Wheat in thrashing yields about half a crop, and now brings $1.25 to $1.28; potatoes, 50c. to 60c.; corn, 55c. Early-planted corn is good; late-planted, very poor. The White Elephant Potatoes are looking fine, considering the intensity of the dry weather. From one small tuber with 15 eyes I have the same number of hills, which are stocky and look very promising; but unless we get rain soon they must dry up with poor results. The Branching Sorghum came up late. Washington Oats were much "smutted" and but indifferently good. T. P. D.

Nebraska.

NEBRASKA CITY, Otoe Co., Sept. 1.—From the seed of the Rural Branching Sorghum I succeeded in getting my 12 hills. The stalks are now higher than I can reach. I have cut back one hill as an experiment to see how it will grow. It has already started several thrifty branches per stalk. The rest I shall leave to seed. My W. E. Potato has not had a first-rate chance, as the bugs have been numerous and hungry. Two of my neighbors get rid of the bugs by shaking them off the vines and either plowing them under or digging a hole between each lot of four hills and burying the pests. The vines of both are quite green. J. H. M.

New Jersey.

LAMBETVILLE, Hunterdon, Co.—My experience with the White Elephant Potato is somewhat different from that of your Florida correspondent. Mine was cut in three pieces—the potato; not the skin,—and planted in ground not manured for more than two years, and behold the "gratitude" of my Elephant—18 big potatoes, weighing 1¼ pound apiece, seven medium potatoes weighing each four ounces: that was 25 potatoes from one—which we thought a big yield, when the ground was not specially prepared for it. F. T.

New York.

AMENIA, Dutchess Co.—The White Elephant Potato weighed 2½ ounces. It was cut to single eyes and planted one eye in a place, making 11 hills. I have dug the potatoes and obtained 44½ pounds of nice tubers—some quite large. The Washington Oats made a large growth of straw, but were rusty, smutty and light. The R. B. Sorghum seed came up pretty well, but the stalks have made but a slender growth. The sorghum has branched considerably, and at the end of August was only 2½ feet high. It was planted on soil of moderate richness and without manure. Asparagus plants doing nicely. I have ten carnations, and a fine show of pinks. P. B. P.

BLODGETT MILLS, Cortland Co.—My Washington Oats yielded 14½ pounds; the White Elephant Potatoes, eight pounds; the Argenteuil Asparagus is 17 inches high; it is larger than the Giant Dutch. The pinks are very handsome. The Rural Branching Sorghum is about four feet high and has ten to twelve stalks from one seed. H. C. K.

CANAAN, Columbia Co., Sept. 3.—Farmers are now busily engaged in plowing and sowing. No wheat is raised in this vicinity, but rye is extensively grown. The average yield of the latter will be somewhat larger than last year. The oat crop was exceedingly good this Summer: hay ditto. Corn will be below the average, owing to late Spring and grubs, and what few potatoes are dug as yet show signs of rotting. My W. E. Potato gave 24 pounds of average-sized potatoes, but they rotted badly. Some farmers in this vicinity raise large quantities of sweet corn for the Shakers at Mt. Lebanon, N. Y., who put it up in cans for the New York markets. Sweet corn unhusked, and delivered at Lebanon, brings from $10 to $15 per ton, this Fall. Prices for almost all farm products are good. Rye is worth about $1.05 at home markets: oats .45c. for new: rye straw $12.00: hay, not much in market yet, but it will probably start at about $12 per ton. We had considerable dry weather during August, but a fine rain on Sept. 1 has refreshed things. D. D.

ELMIRA, Chemung Co.—The Washington Oats produced grain of good quality, though planted upon garden soil, too rich for oats. The straw grew as high as my chin, yet to my surprise it did not lodge. A fair percentage of the Rural Branching Sorghum seed germinated, and the branching stalks have grown finely, indicating a heavy yield of fodder for the amount of seed that grew. Mrs. G. desires me to extend her thanks for the pinks, picotees and the carnations which have blossomed profusely with flowers which, she says, are the most beautiful she has ever seen of the kind. G. A. G. JR.

LAKE GROVE, Suffolk Co., Sept. 2.—I planted the White Elephant Potato on April 15, and top-dressed the ground with manure from the barn-yard and pig-pen. In the drill I used the Stockbridge Potato fertilizer at the rate of 800 pounds to the acre and on digging the potatoes on August 1, I got 14 pounds of tubers. I planted a single specimen of the Pride of America potato at the same time, gave it the same treatment, dug it on the same day and got 13 pounds of tubers, but they were all much finer and larger than the Elephant. Two of them weighed, together, 1¼ pound and many of the others were quite as large. W. E. S.

LOCKPORT, Niagara Co.—It is awfully dry here. Corn is burning badly and farmers can hardly fit land for seeding. The potato crop is nearly a failure. Wheat, barley and oats were all remarkably good. My wheat yielded 40 bushels and one field of eight acres went over 50 bushels. Clover seed is a poor crop, as it is everywhere. J. S. W.

SOUTHOLD, Suffolk Co., Sept. 6.—Farmers have commenced digging potatoes, and the crop generally, so far as I have learned, in this immediate locality, is rather light and somewhat grubbed. Prices range from 45c. to 60c., according to variety and quality, at the boat or depot. Potato beetles are very few in number, notwithstanding the great numbers in July, when I found it necessary to poison twice in one week. I now kill all that I find as I dig. The excessively dry weather will make a short corn crop. Those who failed to plant corn for fodder now see their mistake. The Branching Sorghum made a poor stand and does not promise to amount to very much. The crops of oats and barley are heavy. The Washington Oats did well. Tomatoes have not done well and ripen slowly, with a scant supply. The Acme holds first place. S. T. T.

North Carolina.

HENDERSON, Vance Co.,—Our drought has come to be a fearful one. Corn is dried dead, not more than half the fodder will be worth saving. Neither corn nor cotton can possibly be half a crop. Cattle are getting thin. Crab Grass of which we usually have abundance on our wheat stubbles, has not put in an appearance. The prospect looks gloomy indeed, and farmers who work on the plan of "eat a crop before you make it," have good reason for putting on long faces. M. B. P.

Ohio.

VAN WERT, Van Wert Co., Sept. 3.—The yield of wheat hereabouts was two-thirds of a crop, though some fields turned out a little better. Fife and Fultz are our leading varieties. Oats will average two-thirds of a crop; but the straw was short on account of dry weather. Washington Oats are the leading sort. I am experimenting with 13 different kinds of potatoes in my garden, and the White Elephant promises to take a front rank. The St. Patrick I find a splendid sort on sandy soils, but it does not do well on clay land. Genessee County King, Chicago Market, Early Rose, Burbank, Early Vermont and Snowflake will be good crops if we get any rain by September 10. Corn was never better—this being a low flat country a dry spell is good for corn. The acreage under it is larger than last year, and its condition is much better. Flax and buckwheat are both grown here to a considerable extent and promise to turn out well. The apple crop will be one-half, and pears a full crop. The Rural Branching Sorghum is all that it is bragged up to be, and promises to be the coming fodder plant. Garden crops of all kinds look very fair. The Paragon, Acme, Trophy and Perfection Tomatoes are our leading varieties. Henderson's Early Summer Cabbage excels all other kinds for market purposes. J. A. S.

Oregon.

OSWEGO, Clacamas Co.,—Wheat and oats average crops. Chili Club and White Winter Wheats; Side Oats. Barley and rye not much sown. Corn looks well. Orchard fruits are under an average; small fruits good. The White Elephant Potato promises well. The Washington Oats are growing finely. The R. B. Sorghum is nearly a failure in this climate. J. K.

Pennsylvania.

BADEN, Beaver Co., Sept. 1. Along with the RURAL I take three other agricultural papers. They are all good, but the RURAL is more trustworthy in forecasting prices of grain and produce. That alone makes it of great value to the farmer in regard to holding or selling his products. I believe any man with capital, could safely make money by acting on the RURAL'S predictions. The wheat crop in this county is below an average; for in thrashing it is found the grain is shriveled. Corn has been almost destroyed by the dry weather. Oats are a good average crop. Hay is good. Potatoes half a crop. Apples about a quarter of a crop. No peaches or pears. F. W. S.

HOSENSACK, Lehigh Co., Sept. 2. We have a very dry spell at present; grass is all dried up in the fields, plowing is hardly possible and there is a poor outlook for fall seeding. Winter wheat was a full crop. Oats were heavy in the straw, but light in the grain. Second-crop grass was light and some farmers turned their cattle into their meadows. My White Elephant Potatoes yielded 15 pounds with ordinary field culture—the same given to my other potatoes. The Washington Oats were good. The Sorghum sprouted well, but on account of the drought it was only about three feet high when I let the cattle in who ate it down to the ground. The outlook for the dairy is not very promising as corn has failed and pastures are so poor that early stable feeding is probable. H. E. E. R.

MIDDLEBURG, Snyder Co., Aug. 26.—The Washington Oats did really well, but the Sorghum failed, only a few stalks came up. The flower seeds I think I planted too soon, and we had a wet spell that spoiled them, and the White Elephant Potato did not amount to any thing, like the other late potatoes. Most people hereabouts will not get enough potatoes for their own use, except from the early ones. They were growing well till the dry weather set in. Corn is a failure also; some people will not get enough to fatten one hog. What is on high ground is especially bad. I have 10 acres that is pretty good, but, taking it on an average, there is not half a crop in Snyder County. Oats are good—never better. Wheat does not yield well. The straw lodged too soon and the ears would not fill. It gives about 14 bushels to the acre here; but, take it on an average, I don't think it will yield nine bushels to the acre. The weather is still so dry that we can't plow at all throughout the whole county. J. S.

WEST NEWTON, Westmoreland Co.—Sept. 1st. Wheat is moderately good in this section. Corn was not generally well set on the ground, and owing to the dry weather since earing time, the crop will fall considerably below the average. The pastures are about scorched up; we have so much hot sun that things dry up very fast. Oats were a good crop. Hay was very good—better than usual. Clover seed has to some extent not filled well: many fields are being pastured: there are too many grasshoppers and, perhaps, the hot sun had something to do with it, too. From the White Elephant Potato I got, without any special effort, 26 pounds. The Washington Oats I put in too strong ground. They broke down before they headed. However, I had over a peck of nice, clean oats. The asparagus seed is all right. The China Pinks are blooming very beautifully. The R. B. Sorghum came up very poor and what did come up is trying to die. I can see no value in it. Fruit is not plentiful. Some will have to live on the remembrance of what they let go to waste last Fall. Potatoes are a slim crop. Wheat, $1.32 per bushel. L. D.

Utah.

OGDEN CITY, Weber Co., Aug. 18.—Crops generally have been very good. Fruit is abundant and good. New wheat is selling at 60c. per bushel. Of barley and oats not much has been thrashed yet. Butter, 35c. per lb.; beef, 8c. to 10c.; mutton, the same. I did not have much success with the R. B. S., as I have only five hills growing; but I hope to see it mature. The same ill-luck attended some of the flower seed; my W. E. Potato had twelve eyes or setts, and from these I dug 28 lbs. of nice large potatoes. They were planted on April 25th and dug on August 15th, fully ripe. I treated them with the same attention I gave the others in my garden. The Beauty of Hebron is a fine potato also. I have grown a nice lot of them this season from the seed the RURAL sent. I have distributed quite a number of pounds among my friends and they are all well pleased with them. I find that these potatoes are hard to beat for cooking qualities, being so dry and floury. W. J. H.

Vermont.

FACTORY POINT, Bennington Co., Sept. 4.—This is the driest season known here for years, and on this account potatoes will most likely be a light crop. The RURAL plants and seeds are all doing well, especially the White Elephant Potato. E. W. B.

Virginia.

DISPUTANTA, Prince George Co.—The seeds obtained from the Seed Distribution all came up well and are growing finely. I have a fine lot of young White Elephants; can supply Barnum if he needs any for his show. The Rural Branching Sorghum has eight to fourteen stalks from a single seed, and though the rows are four feet wide, the foliage has met in the row and is a perfect wilderness. Washington Oats did well. Asparagus growing rapidly. The flower seeds I turned over to my "better half;" they came up well; some are in bloom and are beautiful. Permit me to return thanks for the seeds. I am much pleased with the RURAL. I take several agricultural papers, but think the RURAL the best. Consider me a subscriber as long as I can raise $2 to renew. [Long life to you!—Eds.] G. W. P.

PAINEVILLE, Amelia Co.—The White Elephant Potato I cut to single eyes and planted in good land, three feet one way by fifteen inches the other. I cultivated them well, and had it not been for the very dry bad season, and moles, I think I should have made an immense crop. I dug them on August 15—result, twelve pounds of small to fair tubers. The Branching Sorghum seed germinated well, and the plants by the middle of August were from three to five feet high, and there were from seven to twenty-two branches to the hill. All the other seeds did well, except the Washington Oats; they were looking fine, but the cows got to them and harvested them prematurely. Wheat is from half to two-thirds of a full crop; oats, a fine crop; corn and tobacco, except on low lands, are looking poor; vegetables are a failure in consequence of drought following very heavy rains in the Spring and early Summer. J. W.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

TREATMENT OF MARE AND FOAL.

G. M. K., Norwich, asks what is the proper treatment of a brood mare and colt from weaning time all through Winter.

ANS.--A moderate-sized volume might be profitably written for the purpose of giving full and minute directions as to the management of brood mares and their foals, but we will now simply answer the above question by stating briefly the most important course to pursue:—As soon as the colt is taken from the mare she should be put to gentle work and kept at it daily, and fed moderately only, in order to enable her milk to dry up quickly. At first she should be milked by hand three or four times per day for several days; then, as her milk decreases, this should be done only twice a day, and finally only once, and then every two or three days, according to the quantity in her bag, till fully dried. In milking do not strip her entirely clean, for if this is not done she will dry up faster than if the last drop is drawn.

At weaning, place the mare and colt where they cannot see each other, for two weeks or more. It is best to let the colt run in a pasture with other colts if there are any, for the sake of company; if there are no other colts, then let it run with calves, or even sheep. In this case the mare must be kept up in the stable, otherwise, on hearing the colt neigh, she might endeavor to get to it, and be likely to hurt herself against the fence, and the colt also would do the same on hearing her answering neigh. If the colt is shut up in the stable and the mare turned to pasture, it ought to be rather scant until she is dried off, and then she may be better fed according to the work required of her.

In weaning a colt some prefer to put it and the mare in a stable alongside of each other, separated only by a partition not high enough to prevent the dam from reaching over it and touching the foal with her nose. Then let the colt suck about two-thirds of the milk, at first thrice per day, then twice, then only once, and so on till the mare is dried up, being careful to milk her by hand a little every time after sucking, so long as the bag is left moderately full. It is contended that both colt and mare worry less if thus weaned than if separated at once altogether, and kept apart till the colt has lost the desire to suck; but this depends a good deal on the disposition of the animals. In some cases the first method given above is the best, in other cases, the second.

Previous to weaning, the colt must be taught to eat grass or hay and grain or meal also with the dam, otherwise on being taken from her it might pine away and die. It may be weaned at from five to seven months of age, according as it has learned to eat by itself, and its growth and vigor. If the pasture is very good the colt will do well enough on that; but at first, in order to prevent scouring, it should have a half to a pint, according to its size, of oil meal or cotton-seed meal, with one to two quarts of oats night and morning, or the same quantity of a mixture of oats and flax-seed ground together at the rate of four quarts of the latter to 28 of the former.

If the colt is kept up and fed upon hay, then it might become costive. In that case feed two quarts, or a little more, according to size, of wheat bran night and morning with a half to a pint of oil meal, or, in place of these, one or two quarts of the mixed provender of oats and flax-seed. All these form good muscle and bone and give the colt an even, steady growth. Some feed corn or Indian meal to colts, but this is too fattening, and liable to bring on colic. Aged horses only should have corn, although we know it is fed with impunity at the West and South. But the corn there is not so hearty nor so oily, we believe, as that grown at the North; though we are assured that some chemists in their analyses find no particular difference in the elements of the two sorts; still they may be incorrect in this.

During the first Winter colts should not be allowed to stand on a plank, concrete, paved

or, indeed, on any hard floor; if they do it is very liable to form ring-bones or otherwise injure their feet or legs. Dry sand or fine gravel is the best for them to stand on, either in stable or exercising yard; yet if these cannot be had, and the flooring is sufficiently adhesive to keep it damp and, above all, muddy, then it should be so well littered with straw or marsh hay as to keep it dry.

If the mare is not worked after weaning her foal, she will do well enough in fair pasture or on good hay. If worked, she must have more or less grain morning, noon and night, according to the labor she does. If in foal, she ought not to be used except under the saddle or harnessed to a light wagon and driven on dry, smooth ground. If jerked roughly about, or obliged to give a hard, sudden pull, she is liable to slink her foal, which might cause her death, and in any event greatly injure her.

VARIOUS FRUITS.

R. J. P., Iowa City, Ia., was visited some time ago by a tree peddler representing an Illinois nursery concern, and having in jars specimens of various fruits, most of which he claimed were originated by the firm he was canvassing for, and our friend inquires about the following sorts which he offered for sale.

ANS.—APPLES—Red Bietigheimer. A German apple. Fruit large, yellow, with crimson; flesh white, sub-acid and pleasant. Early Fall. Said to be an abundant bearer. It is a large, handsome apple. Stump, originated near Rochester, N. Y., of medium size; yellow, striped with red. Flesh juicy, tender, sub-acid. September and October. Very prolific. Mann. Medium size, very fair quality. Winter. Lady (Pomme d' api), small, flat, with a fine red cheek on yellow ground. Flesh tender, sub-acid, good. It is a fancy apple and brings high prices in the market. Henicher—do not know of it.

PLUMS—Weaver. This is a new plum—one of our wild plums—of good size and flavor, and very productive. Tree hardy. Glass is a new plum which originated in Canada. Large, purple. We know nothing further about it.

PEARS—Kieffer's Hybrid is a new pear of good quality, raised from seed of the Sand Pear, supposed to be crossed with Beurré d' Anjou. Large, glossy leaves. Fruit large and borne early. Ripens in October and November.

STRAWBERRIES—Sharpless. Large fruit, prolific, good quality.

RASPBERRIES—Grapevine. We know nothing of this. It may be the Purple-flowering Raspberry, Rubus odoratus. This has a grape-vine-looking leaf, but the fruit is worthless. It is used as an ornamental shrub.

GOOSEBERRIES—Downing—good.

CURRANTS—L. B. Holland. Do not know it.

CUTTING ANTS.

R. T. J., Austin, Texas, is very much troubled by the cutting ants, which come out of their hiding-place at night and strip a tree of all its leaves, and he asks for some safeguard against the pests.

ANS.—This is Œcodoma Mexicana, one of the strangest species of this strange tribe of creatures. The ants build large nests several square yards in extent and more than a yard deep. These nests are provided with drains for carrying off the water from occasional rains, and with many store-rooms with spacious passages (for ants), which are one to three inches in diameter leading to the chambers where the eggs and larvæ are kept and cared for. The leaves are cut from the trees and carried by a regularly ordered army in columns, into the nests, but for what purpose this is done, whether for food or for building material, is not clearly ascertained. These ants are found on the shores of the Gulf of Mexico and in the interior. They are a great scourge and pest to agriculture, but any remedy against their depredations must depend upon the habits of the animals to a great extent. War should be made upon them at their nests. They can be easily traced to these, and the nest should be destroyed. We would suggest the use of an explosive, as blasting powder, run down into the nest through the main opening, and a piece of fuse put down to the powder. After laying a few logs on top of the nest to confine the blast, the fuse should be fired and the nest would be destroyed. Or dry rubbish might be piled over the nest and burned. It may be made a special study, but there is a way no doubt to manage it.

RENEWING AN ORCHARD.

J. D. C., Westchester Co., N. Y., asks how to renew the sod on an old orchard. If it should be plowed, when? And what crops should be raised in the orchard.

ANS.—We would plow the orchard in the Fall and then either cross-plow it in the Spring or cultivate it thoroughly, according to its condition. Thorough working the ground will help the orchard and also the crop. It should be plowed shallow, especially under the trees, and care should be taken, not to break off or mutilate the roots. Much damage is done to orchards by careless plowing. Corn is the best hoed crop for an orchard, and beans the next best. Potatoes should never be planted in an orchard, as they exhaust the potash from the soil and this is just what the apple trees require. Barley, or Spring rye is the best adapted to be sown for the seeding. Under the apple trees, the grain should be thinly scattered, for much seed would only be wasted on account of the shade, but the grass seed should be put on thickly. The least exhaustive crops should always be grown in an orchard, or else the trees will be robbed of needed sustenance—hence it is always best to pasture the ground rather than mow it; nothing will run an orchard down so fast as to make it a meadow, as it is a double robbery. The ground may be plowed in the Spring, but for an orchard we would prefer turning it over in the early Autumn in order that the trees may have the full benefit of the decayed sod and the more mellow soil.

APPLYING FERTILIZERS TO WHEAT, ETC.

F. W. S., Baden, Pa., says he can get, at the kilns, at a low price, lime that has been exposed to the weather since Spring, and he asks, 1, whether it is of any use; 2, would it be well to apply to wheat a mixture of hen manure and lime; 3, is there any danger that either of these would injure wheat if, mixed with other substances or not, they were drilled in with the seed; 4, how should ground bone be applied to wheat; 5, are apples likely to be high-priced this year—are they scarce or plentiful.

ANS.—1. Such lime is not worth as much as fresh lime, but as it is sold at a lower price it is frequently used for agricultural purposes, and goes by the name of agricultural lime. 2. Hen manure or other fertilizers containing ammonia should *never* be mixed with lime, because the contact sets free the ammonia and wastes it. 3. There is no need to mix the hen manure with anything; reduce it to a fine powder and drill 150 lbs. per acre with the wheat. It will not hurt the wheat in the least. Lime should be spread on the soil after the wheat is drilled; 20 or 30 bushels per acre may be used. 4. Finely ground bone is generally used with benefit, and may be drilled at the rate of 500 lbs. per acre without any harm. 5. Apples are the most abundant of orchard crops this year; yet, as it is the "off" year generally, the crop is short, and prices therefore should, as a rule, be fairly high—considerably higher, however, in some parts of the country than in others, according to the relation of local demand and supply and the cost of transportation to higher-priced markets.

QUERIES ABOUT CREAM.

H. T. P., Wilton, N. Y., asks, 1, does cream rise more quickly when exposed to the air than when covered; 2, does exposed milk absorb any of the impurities in the air; 3, what is the best temperature for the separation of the cream.

ANS.—1, The cream is thicker when the milk is set in shallow pans and the cream is exposed to the atmosphere. Cream rises more quickly in deep pans at a low temperature, than in shallow pans at a higher temperature. Exposure to air makes no difference in the time of the cream's rising. 2, Milk quickly absorbs odors arising from any impure or decomposing substances. The genus of mold or mildew produce fermentation and acidity in milk, therefore moldy cellars are quite unfit for keeping milk in, and so are cellars in which vegetables are kept. As the cream lies upon the surface, this is, of course, the most exposed to impurities in the air, and we usually find these concentrated in the cream. 3, When milk is set in deep pails, 45 to 50 degrees is the best temperature, when in shallow pans, a temperature of 60 degrees is preferable.

RAISING RICE IN VIRGINIA.

J. E. S., Wellsville, Nottaway Co., Va., asks how to raise rice, as he wishes to cultivate it there.

ANS.—No rice is at present raised in Virginia, and it is probable that the conditions for the profitable production of this crop do not exist in the State; or if they do it is to a very limited extent. In 1860, something more than 8,000 lbs. were raised. No report of any production since that period has been made. It had already at that time declined one-half from 1850. If J. E. S. lives on some large water-course, from which his lands can be flooded, he might succeed in raising rice, but it would require considerable capital and outlay in building canals, dams and flood-gates. The rice area is confined principally to a few counties in South Carolina and Georgia, and a few parishes in Louisiana. A little is raised on the tide-water lands of North Carolina, and a still smaller amount in Florida, Mississippi, Alabama, Arkansas, Texas and Tennessee. Raising up-land rice has been tried in several States, but it hasn't proved profitable.

APPLYING LIME AND HEN MANURE TO WHEAT.

T. P. D., Oshtemo, Mich. asks whether it would be safe to drill in air-slaked lime with wheat alone or in combination with unleached ashes; also whether hen manure mixed with road dust might be safely so drilled in with wheat.

ANS.—It would be safe enough; but it would be of little effect, because lime so applied must be deficient in quantity; 25 bushels of lime per acre are little enough to produce any marked effect. It is not safe to apply ashes with the seed, as the caustic effect would be injurious to the young germ if not to the seed. Hen manure beaten fine with a flail and mixed with an equal part of fine gypsum might be safely and usefully drilled with wheat. It would be an effective fertilizer to start the growth, but not to maintain it in vigorous condition. The best way to apply lime is to scatter it broadcast before the final harrowing and the drilling of the seed.

MEASURING HAY IN A MOW.

J. R. B., Reitman, Ohio, asks, how to measure hay in the stack or mow.

ANS.—400 cubic feet of hard-packed, clear Timothy hay will make a ton; so will 500 cubic feet of mixed clover and Timothy hard packed. Clover alone requires 600 to 700 cubic feet for a ton, and common mixed meadow hay, including a large proportion of Red Top and June Grass, will require 700 to 800 feet. The weight depends somewhat upon the ripeness of the hay; ripe hay is heavier than that made from early cut grass. No rule can therefore be given that will give accurately correct results; but the general rule is: Multiply the length in yards by the hight in yards and the product by the width in yards and divide the product by 15; the quotient will be approximately the number of tons.

Miscellaneous.

C. H. D., Occoquan, Va. 1, has some land which is now under corn for the second year, and wishing to seed it down to clover and wheat this Fall in the following manner, he asks whether we approve of it:—After cutting and removing the corn he intends to use the shovel-plow, sow the wheat broadcast with at least 300 pounds of fertilizer; and harrow it in, then sow the clover and brush it in. One part of the land he wishes to seed to Alsike, and the rest to Red Clover. 2, Wishing to put two acres of upland in Alfalfa, our friend asks whether it is likely to thrive in that part of the country and whether it should be sown in Fall or Spring.

ANS.—1, The plan proposed for sowing Alsike and Red Clover will answer provided the clover is sown not later, at furthest, than Sept. 20th. Earlier than that would be still better. 2, No reliable tests of Alfalfa have been made in Virginia. It is doubtful whether it would succeed on upland, unless the latter were turned to a depth of twelve inches at least. Not being as hardy as Red Clover, the seed of Alfalfa should be sown in the Spring—in the latter part of March or 1st of April. It should be sown alone without any protecting crop.

E. W. K., Glens Falls, N. Y., sends for name specimens of a plant the tubers of which are quite eatable when boiled or baked, tasting somewhat like a sweet potato. The vine climbs up 20 to 30 feet and dies down to the ground every Fall.

ANS.—Botanically it is Apios tuberosa—Ground-nut. The tubers are nutritious, and would perhaps be cultivated had we not the other tuberosum (Solanum), otherwise known as the Irish potato. It is a pea vine, something like the popular Wistaria. It blooms in July and grows wild from the Eastern States to South Carolina.

M. C. N., Springboro,' Pa. asks, 1, at what age should peaches be budded; 2, should the operation be done in Fall or Spring; 3, should the buds be taken from the main or lateral branches, from the ends of the branch, or from some other part.

ANS.—1, The first or second Summer is the best time; in the latter case they should be cut down the previous year and only one shoot should be permitted to grow. A strong shoot for the bud will thus be insured. 2, Now. 3, Select the buds from the strongest shoots. The terminal buds of the peach are often the hardiest.

S. T. E., Setauket, N. Y., wishes a remedy for pea weevils.

ANS.—The eggs of the weevil are deposited on the pods, so that the young grubs become fully grown about the time the peas ripen, and in the peas they remain and change to beetles during the Autumn. As they remain in the peas during the Winter, all peas saved for seed should be kept in air-tight boxes or cans, and a little benzine be poured in on the bottom of the box. The vapor arising from it will kill the weevils. Persian Insect Powder may be sprinkled in the box with good effect.

A Constant Reader, Chadwick, Mich., says:—"Several weeks ago I saw in the RURAL an inquiry from Mr. J. R. Livingstone, as to where he could get Quack Grass seed, and having seen no reply in the paper, I suppose the answers were sent directly to him, as his full address was given. As there are two or three fools of just the same stripe anxious to sow Quack seed in this neighborhood, I should be obliged to Mr. Livingstone if he would let us know whether he has obtained the seed and from whom."

W. M. K., Washington, D. C., referring to an item in a late RURAL, telling of the new Californian method of preserving grapes by packing them in wheat bran reduced to charcoal, asks how to reduce the bran to charcoal.

ANS.—The bran must be charred in a close vessel. A large cast-iron caldron may be used, with a cover fastened down with clamps and luted with clay. An opening must be left to allow the gases of combustion to escape. Fire is made under the caldron and around it, but the cooling must be very slow or the caldron will be apt to crack and the charcoal to inflame.

J. A. S., VanWert, Ohio, asks, 1, what is the best way to propagate the Calla Lily; 2, is cold well water applied to plants bedded out injurous at this season; 3, would it be too early to lift bedded-out house plants now and would they do better if cut close; 4, what is the best means to make celery grow faster.

ANS.—1, By offsets grown in small pots. 2, We should prefer to let it stand awhile. 3, No. Some would and some would not. 4, Manure water. The other questions will be answered later on.

J. B., Union, Broome Co., N. Y. asks, 1, whether Quack Grass will grow from seed; he has tried to get a "catch" for two years but failed, although the land would produce good crops of corn, oats, rye and potatoes; 2, is there any other grass that will produce as much feed per acre as Quack and do it as early.

ANS'—We have never sown Quack seed, but believe that good seed will germinate freely—as freely as wheat. Kentucky Blue Grass is early, but it will not "make as much feed."

S. L. S., Onaquaga, N. Y., having lately lost several hens, asks what ailed them, and how to cure others similarly affected. On opening the defunct ones their livers were found to be very large and the fowls very fat.

ANS.—This is the result of over-feeding which engorges the liver and causes it to increase very much in size. Give them a dose of starvation for a week or two; let them pick their own food.

W. H. C., St. Joseph, Mich., says that Golden Grains or Palestine Mammoth Wheat is being sold thereabouts, in 50-cent packages, at the rate of $120 per bushel, and he asks what we think of it.

ANS.—We believe it to be Black-bearded Centennial. It is too late, as we believe, for your climate. See Wheat Number.

W. M., McGraweville, N. Y., asks, how to root the tips of Black-cap raspberry canes, and when it should be done.

ANS.—The tips of the bent-down branches root *very* readily when covered with earth or even when merely in contact with the ground. August or September.

NOTE.—Several specimens of quince have been sent us affected with a reddish-yellow fungus which causes the fruit to shrivel up and fall. The fungus is Rœstelia aurantiaca and the only remedy suggested by those of whom we have made inquiries, is to destroy the infested parts by burning, so as to prevent the dissemination of the spores.

J. B. C., Factoryville, Pa., sends for name specimens of a caterpillar found on apple trees.

ANS.—It is commonly known as the Red-humped caterpillar, so named from the red hump on the third ring of the body. Different broods make their appearance during August and September.

T. D. E., Terminus Ranch, M. T., sends for name specimens of a grass he finds growing in his meadows and in low places.

ANS.—It seems to be Kentucky Blue Grass—Poa pratensis.

A. A. G., Brantford, Canada, asks, whether it would be advisable to sow salt on Fall-sown wheat.

ANS.—Only as an experiment. Spring is the best time to sow salt on wheat.

COMMUNICATIONS RECEIVED FOR WEEK ENDING SATURDAY, SEPT. 10.

We have received two apples from W. H. Atkins, Westfield, Mass., unaccompanied by any note of explanation or inquiry.—C. E. P.—R. T. I., (Austin, Texas.) We may do so next year.—J. S. C.—H. A.—J. F. THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, SEPT. 17, 1881.

Our correspondent Mr. B. F. Johnson of Illinois, has through many years proven himself a wise weather profit. As may be seen in another column he predicts that "a very cold and snowy Winter is pretty sure to follow our long, dry Fall."

We are afraid that some of our friends will fail to realize the true value of the Rural Branching Sorghum until they follow directions more closely. We recently saw two or three plots in Columbia Co., N. Y., which though doing finely were not producing as much fodder as they might if the stalks had been cut off and new shoots allowed to start out.

We may call this a "catch-up" number of the Rural. Readers who have asked questions or sent us specimens of fruits or insects for name will kindly bear with us. The special work of the season both at the Farm and in this office is and has been for several weeks, such that we have been obliged to neglect the requests of friends whom we would gladly have served.

Education in the South.—According to Educational Commissioner Eaton who spoke on "Education at the South" at the late meeting of the Social Science Association at Saratoga, the outlook for educating the negro at the South and thus raising him to a higher rank in citizenship, is very promising. Per capita taxes are now levied on all for the support of schools; normal schools and departments are being established rapidly; school and college endowments are being increased; libraries are being established and there is a growing belief among the whites that education is a good thing for the South. One of the most encouraging features is the number of young men and women who are fitting themselves for the position of teachers.

A Commission for the purpose of "procuring data touching the agricultural needs of that portion of the United States lying west of the Rocky Mountains and the arid regions," has recently been appointed by Commissioner Loring. It consists of our esteemed contributor, Ex-Governor Robert Furnas, of Nebraska; Professor Hilgard, of the Agricultural College of California, and the Hon. T. C. Jones, of Ohio. The Commission is soon to meet at San Francisco to begin operations. From the character of these gentleman we have high hopes that their labors will redound greatly to the public advantage. Governor Furnas from his wide acquaintance with the resources of the Far West and his long experience in the best methods of developing them, is especially well fitted for the proposed investigations.

The success of the Atlanta Cotton Exposition is likely to be due to Northern capital, liberality and enterprise as much as to Southern products; for already the North has subscribed $100,000 towards making it a success against $50,000, the aggregate contributions from the entire South. Though the chief city in Georgia is likely to be the greatest gainer by it, still the legislature of that State has, by an overwhelming majority, defeated a bill appropriating the paltry sum of $10,000 to its support. The principal argument against the grant was that the exhibition was a private, money-making concern originating outside the State. Notwithstanding this cold Georgian shoulder turned towards the undertaking, it is very likely to prove a brilliant success, as Northern exhibitors are engaging lots of space and Southern merchants, railroads, manufacturers and producers seem to be heartily co-operating.

The Hulbert Canning and Drying Co., of California, engaged to take and pay for, at the uniform rate of five-eighths of a cent per pound, all the fruit raised by Francis Veerkamp and delivered at the Company's works at Upper Placerville, excepting Mission grapes, "and to furnish boxes for picking and hauling the fruit," Veerkamp engaging to deliver the fruit in good condition and when suitably ripe and to "sell no fruit to other parties except one load early." The fruit was duly delivered as it became ripe, but before the whole crop was ripe Veerkamp demanded pay for the fruit delivered; but this was refused until the entire crop should be sent in. Thereupon Veerkamp refused to send more fruit, sued for pay for what had been sent, and recovered judgment. The Company appealed and the Supreme Court of California has affirmed the judgment. In his opinion Judge Rose said: "In the nature of things the fruit ripened at different times, and had to be delivered at different times. The contract fixed the rate per pound at which the company was to pay for it, and as each lot was delivered there became due and payable for it to the plaintiff the value thereof at the rate per pound fixed by the contract."

STOCK FEED FOR FALL AND WINTER.

In view of the certainty of the scarcity of corn and of high prices for all sorts of food for live stock during the coming Fall and Winter, farmers cannot be too careful of the supply on hand. Straw and corn fodder are sure to be much more largely used as supplementary feed than heretofore, especially at the West where straw and even corn-stalks have hitherto been lightly esteemed for feeding purposes in many places. During the terrible drought on the Pacific Coast a couple of years ago, when thousands of stock starved to death, loud regrets were heard on all sides at the foolish waste and destruction of straw at thrashing time; for had it been stacked so as to keep well, it would have been a godsend to cattle and their owners in those days and months of famine. Rather than over-economize by reducing the feed of stock too much, however, would it not be better to weed out one's herds and flocks and dispose of all inferior animals early—before they have diminished the feed supply of those it will pay to keep? With animals intended for market it is more economical to give them full feed so as to have them ready for sale as soon as possible, rather than to reduce their rations and be forced to keep them longer. Now is a good time to lay plans for economizing feed during the coming Winter, which nearly all the weather prophets predict will be a long and very severe one; and in this connection it must be borne in mind that shelter for stock from its severity is equivalent to a large saving in their feed.

THE REMOVAL OF THE PRESIDENT.

On Tuesday morning Sept. 6. the removal of President Garfield to a little cottage at Long Branch was successfully accomplished. It would have been a bold step to take, were it not that every possible arrangement had been made for his convenience, and that the risk arising from accompanying circumstances had been reduced to a minimum by his thoughtful attendants. The fact is noteworthy that a patient who has been so greatly reduced in strength as he, and so liable to sudden relapses from various, and, perhaps, unforeseen causes, has been removed so far by rail without any positive injury, and without materially retarding his progress toward recovery. The malarial atmosphere of Washington made it unwise, and even dangerous, to keep the President longer at the White House, and it was evident that quite as much risk would be run in leaving him there as in removing him to a more healthful location. Much credit is reflected upon those who had the matter in charge, for the very quiet and unostentatious manner in which they accomplished his removal, and though the scene at the departure from the Presidential Mansion brought tears to many eyes that beheld it, the fact that the journey was successfully made, brought gladness to many hearts, though at this writing his general condition is less favorable than during the earlier days spent at his ocean home. With the pure, invigorating sea-air to lend its genial influence in bringing health to body, and the grandeur of the ocean, to relieve the mind, we shall still have faith in the recovery of our President.

THE MICHIGAN HORROR.

Woful indeed is the cry of bereavement, agony and desolation that from the fire-scourged districts of Michigan appeals to the sympathy and generosity of the entire country. Whole counties, notably Huron, Tuscola and Senilac, have been blackened, ravaged and made desolate by the all-devouring flames. Everywhere throughout the fire-swept region, farm buildings, fences, standing and stacked crops, stock, farm implements and all other property have been utterly destroyed or irremediably ruined. But sadder than all is the disastrous loss of human lives estimated to have amounted to fully 500. Nearly 300 deaths are positively ascertained to have taken place, and a great deal of the burnt district is still to be heard from. Along the roads on which they were fleeing from destruction, in wells in which they sought refuge, in the fields, the woods, the by-ways, amid the ruins of their homes and outbuildings have been found the charred or suffocated bodies of the victims of this awful calamity—men, women and little ones. Nor is the plight of those who escaped death much less sad. In an hour the results of the labors of a life-time have been swept away. Wretchedness and penury have succeeded to comfort and competence. Discouraged by disaster and by lack of means, the struggle for a livelihood has to begin again, while even for the present seeding, at least 50,000 bushels of wheat, and other seed in proportion, will be needed. Already the magnificent charity of the country is coming to the aid of the afflicted. Here a committee of our most prominent merchants has been appointed to collect subscriptions for the relief of the sufferers, and upwards of $7,000 were contributed in a few hours. Other cities are following this excellent example. The burnt district was eminently agricultural. The sufferers are almost exclusively farmers. We trust that the farmers of the country will generously contribute to the relief of their co-workers in the day of their distress.

BREVITIES.

It appears from a note from Mr. Wysor, of Virginia, that Silver Chaff has been tried there and in a measure fails. It winter-kills and is too late.

With what pride does not the American "patriot" look upon the census returns that give to his country 50,000,000 inhabitants, entirely oblivious of the fact that India, a mere dependency of the British crown, has 250,000,000 of 'em—but, thank Heaven, Americans are not East Indians.

Mr. Joseph Galbraith writes us that he has frequently experimented with different varieties and finds that wheat raised in New York, Michigan, Canada or any far Northern State, will come to perfection and yield much better than any varieties of Southern wheat. His farm is in Cumberland Co., Pa.

We much prize the following compliment from Pres. Marshall P. Wilder who, we believe, has as many earnest friends and as deservedly as any other horticulturist of our time:

"The 'Rural' is one of the best of 20 papers that I read. It is wide-awake, practical and judicious."

The Commissioner of Agriculture of Va. suggests that every person in the State over 10 years old, should celebrate the Yorktown Centennial (Oct. 5) by planting a tree in the yard, field, roadside or forest. Black walnut is recommended. We make the same recommendation to all of our readers; and if it is adopted the Yorktown Centennial of 1881 will be gratefully remembered by thousands of those who will see that of 1981.

Prof. Brewer questions if all the money won at agricultural fairs pays more than half the actual expenses of the winners in entering the object exhibited, caring for it there, and getting it home again. It is not the cup won at a boat-race, that incites young men to do so much labor, spend so much time and money, and exercise so much self-denial while training, but its possession is the sign of victory—and so of the prizes won at our fairs.

Two or three months ago the Legislature of Illinois passed a law relating to cattle and other live stock, and among other things it provided for the appointment of a State veterinarian to aid in enforcing the provisions of the law. Governor Cullum has lately conferred this appointment on Dr. N. H. Paaren, of Chicago, a gentleman very favorably known throughout the West, and indeed all over the country, by his valuable contributions to the agricultural press, and by twenty years of earnest labor in his profession.

Delegates from all parts of the State attended an important meeting of the California Growers' Association in San Francisco, on Sept. 5, to consider what policy the farmers should pursue in view of the quiet condition of the wheat market consequent upon the heavy freights charged by vessels and the unwillingness of buyers to pay satisfactory prices. It was decided that as the English wheat crop is a failure and California had only one-fourth of last year's yield it would be best for farmers to hold their wheat till after another meeting on the 14th inst. and that meanwhile every farmer should send in an exact statement of the wheat grown in his neighborhood.

Many of the specimens of wheat which we have received in competition for the several little premiums offered by the Rural a few months ago, are simply wonderful as to size, weight and beauty. Except that we have already more than we can well attend to at this season, when both farm and editoral work presses hard, we should be glad to have all of the specimens nicely arranged and labeled and exhibited at some of our principal fairs. It may be doubted whether so many or such perfect specimens have ever before been collected together.

The present drought is the most severe on Long Island that has been experienced for 10 years, and we can fully sympathize with our Western readers who are similarly afflicted. Early field corn will prove a light crop, and late corn is so damaged that rain, should it fall at once, can do no good. At the Rural Farm upland corn was literally burnt up while yet the ears were in the milk. That on lowlands is still looking very well and will yield fairly even though the drought continue. Our fields, which usually at this season afford an abundance of pasture, are now so dried that we are cutting corn and feeding it as needed to our cows.

In view of the growing scarcity of black walnut, black birch is largely taking its place, as well as that of cherry which is also becoming very scarce. Birch has much the same color as cherry, and is just as easy to work as black walnut and as suitable for nearly all the purposes for which that wood is used. When properly stained it is nearly impossible to distinguish it from walnut, and it is susceptible of a beautiful polish equal to that of any wood used in the manufacture of furniture. Large quantities of it are imported from Canada in some parts of which it is very plentiful and cheap, costing only about a dollar per hundred feet at the saw-mills.

The latest returns of live stock landed at Liverpool from this country and Canada show large increases. In a single week the importations amounted to 1,808 cattle; 2,800 sheep; 4,748 quarters of beef, and 453 carcasses of mutton. In the four weeks from August 6 to August 27 there were shipped from this port 3,748 head of cattle; 17,651 quarters of beef; 729 sheep, and 3,299 carcasses of mutton. The shipment of hogs has stopped; but more hogs were raised in England last year than in any previous year, the number now in the country being 2,048,000, an increase of 47,192 over 1880 and 43,527 over 1879. There is a decrease, however, in the number of sheep and lambs of 2,036,806 less than in '80, and of 3,574,926 less than in 1879. Our exports of mutton and sheep, therefore, are likely to increase.

The Royal Agricultural Society of England seldom "makes expenses" from its great annual shows. Out of the 42 fairs it has held in various parts of the Kingdom, from 10 only has any profit been realized, and up to the present year its net losses have aggregated $225,369, the wet, muddy Kilburn show of 1879 having contributed $68,031 towards this deficit. This year's sunshiny Derby show has diminished the loss by some $15,000, although the premiums were large and the outlay liberal. Unlike American agricultural societies, whose chief or only revenues come from the gate money and other receipts at fairs, the Royal is mainly supported by the regular subscriptions and occasional donations of its members, each of whom—and they number from 6,000 to 10,000—subscribes five dollars a year.

Speculation in farm products seems greater now than at any time within our remembrance. It is not confined to regular speculators or dealers or to large cities or good-sized towns, but it pervades villages, hamlets and farm-houses like the lottery craze, and with equally demoralizing effects. All over the country, but especially at the West, farmers are speculating, not only in the products they have raised themselves, but also in the regular markets, in which they run a double risk—that from the inevitable fluctuations of prices and that from the trickery or absolute dishonesty of the agents to whom they confide their money for such gambling purposes. Very earnestly indeed do we beg our readers to refrain from this pernicious practice, in which the chances are so mightily against them, and in which even success itself has a demoralizing tendency.

On August 18, E. W. Morcord, of Watertown, N. Y., bought from S. R. Ford, of the Produce Exchange, of this city, 20,000 bushels of barley for October delivery, depositing a margin of $4,000. Since the purchase the price of barley has risen, and a couple of weeks ago Ford refused to keep his agreement. The matter was referred to an arbitrator, who dismissed the case because Ford claimed that the contract was made after 'Change hours and therefore was not good. The attention of the Board of Managers of the Produce Exchange having been directed to this decision, it was unanimously resolved that the attention of the grain trade should be called to the rule which ordains that trade in grain for future delivery—options—must take place between the hours of 10 A. M. to 4 P. M. It was agreed at a meeting of the grain trade that in future all trade after 4 P. M.—the hour for closing the Exchange—must be discontinued. A contract for the sale and purchase of grain made after that hour cannot be enforced.

For some years reports have been circulated, from time to time, of the ravages of a mysterious disease among the cattle of Nova Scotia, and of late—since the trouble about pleuro-pneumonia began—these reports have attracted more attention than formerly. Dr. E. F. Thayer, of the newly appointed Cattle Commission, having visited the infected region, has made a report of the results of his investigations to Assistant Secretary H. F. French, of the Treasury Department. In his researches he was aided by Dr. McEachran, the well known Canadian veterinarian, and from all accounts of the disease obtainable and a post-mortem examination of a couple of infected beasts, it had been concluded that the disease is probably not contagious, and that it is very likely due to the eating of a plant or weed known locally as "Stinking Willie," which was imported from Scotland "many years ago" in the soil with which a vessel was ballasted, and which since then has "become thoroughly mixed with the grass for many miles in extent."

For Women.

CONDUCTED BY MISS RAY CLARK.

AT MILKING TIME.

EDGERTON.

BLUE-EYED Mary at the gate,
How patiently the lass can wait
While all the cows, who've had their fill,
Move slowly, at their own sweet will;
One by one, in single file,
Cropping by the way, the while,
Down the well-worn path they move,
From the pasture-field above.

"Ca-sook! ca-sook!" sweetly and clear,
Falls softly, on the listening ear,
At intervals too long between
To indicate the restless mien
Of Mary in her business mood—
The marvel of that neighborhood,
And pattern girl through all those parts
For business in domestic arts.

Ordinarily, at the gate,
She cannot bide to stand and wait
The lazy movement of the cows,
But goes to meet them—she and "Towse,"
Claps her brown hands to make them run,
While Towser, eager for the fun,
Barks, frisks and plays round every one
'Till all the cows come scampering home.

But now, with other thoughts at play,
She kindly lets them take their way,
Stares out a-field with vacant look
And calls out dreamily, "ca-sook,"
While Towser, with his great brown eyes,
Looks up at her in dumb surprise,
Wags coaxingly his bushy tail,
Then glances at the empty pail.

But blue-eyed Mary heeds him not—
Her canine friend is quite forgot—
Nor wakes she from her reverie,
'Till Farmer Jones steps out to see
What's keeping Mary at the gap,
And wonders who can be that chap
Off through the gloaming in the lane—
"Surely that can't be neighbor Payne?"

"Mary, my girl, where have you been?
And why are not the cows turned in?
You loiter pet, this is not right,
Your milking will be late to-night;
It's time that we were all in bed
And I've not had my milk and bread;
Come, Towser, fly about, my chap,
And bring your cattle to the gap!

"They say the country's full of tramps—
The thieving, good-for-nothing scamps—
And, if my eye-sight served me right,
I caught a glimpse of one to-night
A sculking yonder in the road—
I'd hoped they'd miss *this* neighborhood;
I'll go and loose old Bull and Jack,
And put them on the rascal's track."

"Why, father, that was only Fred,
Who just ran over here, he said,
To bring the news, and let me know
That Sallie Cooper had a beau;
They're going over Wednesday
To see the circus-actors play;
Fred says the acting 's real fine
And Sallie 'll have a grand good time."

"I'd think old Cooper 'd be ashamed—
At least, he's greatly to be blamed—
To let his daughter traipse and go
To every passing monkey-show;
My daughter nev— what is it pet?
You're suffering from the headache yet;
Poor child! you're in a sorry plight,
We'll let the milking go to-night."

"Why, father, Fred would like to come
And bring his two-horse rig along
To fetch me over to the show,
If you'll consent and let me go."
"Why, yes, my child, why should you stay?
I'll not be mean and say you nay.
Where neighbor Cooper gives consent
Must surely be quite innocent."

DESCRIPTION OF CUTS.

FIG. 459.—CHILD'S PETTICOAT: KNITTING.

Materials Required: Berlin or Lady Betty wool, the latter is very soft, and two bone pins, No. 12 gauge.

The petticoat is knitted in three pieces. Cast on any number of stitches divisible by nine according to the size you require the petticoat. There will be twelve stitches to the inch.

1st Row: Purl eight, knit one, repeat. End the row with knit two.

2nd Row: Purl two, knit seven, repeat. End the row with knit eight.

3d Row: Purl six, knit three, repeat. End the row with knit four.

4th Row: Purl five, knit four, repeat. End the row with knit five.

5th Row: Purl four, knit five, repeat. End the row with knit six.

6th Row: Purl six, knit three, repeat. End with knit four.

7th Row: Purl two, knit seven, repeat. End with knit eight.

8th Row: Purl eight, knit one, repeat. End with knit two.

Then repeat from the first row. Each pattern measures three quarters of an inch, so that you may easily calculate how many patterns are required for the length of the petticoat. After having finished the last pattern, work a row thus, for the waist: Make one, knit two together, knit one. Repeat. Knit three plain rows. The three breadths are joined together on the wrong side with a needle and wool. For the crochet edge round the bottom of the petticoat, one double into the first stitch that is knitted throughout, pass over three stitches, three trebles, three double trebles, and three trebles into the next, pass over three stitches and repeat. A tape is run through the holes made in the row after the last pattern; the petticoat can then be drawn up to fit the waist.

FIG. 458.

FIG. 458.—ARTIST'S BAG, FOR PENCIL, BRUSHES, &c.

The material used for the foundation of the embroidery is striped linen, measuring eighteen inches long and ten inches wide, ornamented with a design worked with colored crewels. The lining is of oil silk; it is covered with the embroidered linen. The ends are drawn together by scarlet cord, and a strap of embroidered braid is fixed to the top. The tassels may be made by turning wool round two fingers, tying it at the top, and cutting it at the bottom.

FIG. 461.—CHEVAL FIRE-SCREEN.

THIS screen is of common deal, and can, of course, be made by any carpenter of the required size; the frame is entirely covered with plush, which is sewn on as neatly as possible, the seam coming at one of the inner edges of the frame. The centre of the screen may be on a foundation of satin, plush, or velvet. Plush has the prettiest effect. For design personal taste must be the guide for selection. Sew the center to the corners of the covered frame.

FIG. 460.—CHAIR BOLSTER.

The bolster, as shown in Fig. 460, is covered with dark blue satin over a cushion twenty inches in length and sixteen in circumference. The satin is gathered, and fastened at each end under a rosette of ribbon, from which emerges

FIG. 459.

the ribbon that passes over the back of the chair; two bands of crochet lace and insertion are placed over the satin; the insertion and lace are worked separately, and joined when finished by a needle and thread. The insertion shown is worked as follows:

1st Row: Take a length of braid, and work three trebles into a picot, keep the top loops on the hook, pass over two picots, and work three trebles into the next, keep the top loops on the hook, and draw through all together, four chain, one single into the same picot, one single, separated by three chain, into each of three successive picots, four chain. Repeat from the beginning of the row.

2d Row: One single into a picot of another length of braid, three trebles into the top of trebles of last row (see design), four chain, pass over two picots, one single into the next, three trebles into the same loop the last trebles were worked into, one single, separated by three chain, into each of three successive picots. Repeat from the beginning of the row.

FIG. 460.

For the lace, take a length of mignardise, and work one single into each of three successive picots, drawing through the top picot of heading mignardise, six chain, draw through the centre picot on next scallop of heading, seven chain, pass over one picot, one single into the next, four chain, three trebles into the same picot, pass over two picots, three trebles into the next; keep the top loops of all the trebles on the hook, and draw through all together, four chain, one single into each of ten

FIG. 461.

successive picots, three trebles between the four trebles of last row, four chain, one single into the same place, four chain, pass over two picots, one single into the next, three trebles into the place the last were worked into, four chain, one single into the same picot, seven chain, one single into picot of heading, six chain, pass over one picot, and repeat from the beginning of the row.

For the heading:

Wave a length of mignardise as shown in the design, and draw the picots together with a needle and thread, passing the thread at the back of the work. This is joined to the edging on the other side of the heading; work one single into the centre picot of a scallop, six chain. Repeat.

FIG. 462.—BASKET FOR SOILED COLLARS CUFFS, &c.

The basket, which is in the shape of a barrel, is of wicker, on a stand of black bamboo. It is lined with blue cambric, and ornamented with bands of art-canvas, embroidered with crewels in cross-stitch. The top of the basket is ornamented with a quilled ruche and bows of blue ribbon.

FIG. 464.—INSERTION: CROCHET AND FANCY BRAID.

This pattern is suitable to be used as a stripe for antimacassars, &c., inserted between other stripes of embroidery, ribbon, &c.

For the centre; One treble into the second, third, and fourth picots on a medallion of braid (keep the top loop of each treble on the hook), one treble into the fifth picot and second picot on the next medallion together, one treble into each of three next picots; take another length of braid and work in the same way as described on two medallions, keep all the loops on the hooks (see design), and draw through altogether; fasten the cotton firmly at the back of the cluster; the picots in the centre of the bar of mignardise must be joined with a needle and cotton.

2nd Row: For the stars: On the other side of braid work two double trebles into the fifth picot on a medallion, keep the top loop of each on the hook, and draw through both together (as all the double trebles are worked in this way we shall not repeat the directions); pass over two picots, two double trebles into the next, four chain, one single into each of ten successive picots, three trebles between the four trebles of last row, four chain, one single into the same place, four chain, pass over two picots, one single into the next, three trebles into the place the last were worked into, four chain, one single into the same picot, seven chain, one single into picot of heading, six chain, pass over one picot, and repeat from the beginning of the row.

For the heading:

Wave a length of mignardise as shown in the design, and draw the picots together with a needle and thread, passing the thread at the back of the work. This is joined to the edging on the other side of the heading; work one single into the centre picot of a scallop, six chain. Repeat.

FIG. 462.—BASKET FOR SOILED COLLARS CUFFS, &c.

The basket, which is in the shape of a barrel, is of wicker, on a stand of black bamboo. It is lined with blue cambric, and ornamented with bands of art-canvas, embroidered with crewels in cross-stitch. The top of the basket is ornamented with a quilled ruche and bows of blue ribbon.

FIG. 464.—INSERTION: CROCHET AND FANCY BRAID.

This pattern is suitable to be used as a stripe for antimacassars, &c., inserted between other stripes of embroidery, ribbon, &c.

For the centre; One treble into the second, third, and fourth picots on a medallion of braid (keep the top loop of each treble on the hook), one treble into the fifth picot and second picot on the next medallion together, one treble into each of three next picots; take another length of braid and work in the same way as described on two medallions, keep all the loops on the hooks (see design), and draw through altogether; fasten the cotton firmly at the back of the cluster; the picots in the centre of the bar of mignardise must be joined with a needle and cotton.

2nd Row: For the stars: On the other side of braid work two double trebles into the fifth picot on a medallion, keep the top loop of each on the hook, and draw through both together (as all the double trebles are worked in this way we shall not repeat the directions); pass over two picots, two double trebles into the next, four chain, one single into each of ten

FIG. 461.

successive picots, three trebles between the four trebles of last row, four chain, one single into the same place, four chain, pass over two picots, one single into the next, three trebles into the place the last were worked into, four chain, one single into the same picot, seven chain, one single into picot of heading, six chain, pass over one picot, and repeat from the beginning of the row.

For the heading:

Wave a length of mignardise as shown in the design, and draw the picots together with a needle and thread, passing the thread at the back of the work. This is joined to the edging on the other side of the heading; work one single into the centre picot of a scallop, six chain. Repeat.

FIG. 462.—BASKET FOR SOILED COLLARS CUFFS, &c.

The basket, which is in the shape of a barrel, is of wicker, on a stand of black bamboo. It is lined with blue cambric, and ornamented with bands of art-canvas, embroidered with crewels in cross-stitch. The top of the basket is ornamented with a quilled ruche and bows of blue ribbon.

FIG. 464.—INSERTION: CROCHET AND FANCY BRAID.

This pattern is suitable to be used as a stripe for antimacassars, &c., inserted between other stripes of embroidery, ribbon, &c.

For the centre; One treble into the second, third, and fourth picots on a medallion of braid (keep the top loop of each treble on the hook), one treble into the fifth picot and second picot on the next medallion together, one treble into each of three next picots; take another length of braid and work in the same way as described on two medallions, keep all the loops on the hooks (see design), and draw through altogether; fasten the cotton firmly at the back of the cluster; the picots in the centre of the bar of mignardise must be joined with a needle and cotton.

2nd Row: For the stars: On the other side of braid work two double trebles into the fifth picot on a medallion, keep the top loop of each on the hook, and draw through both together (as all the double trebles are worked in this way we shall not repeat the directions); pass over two picots, two double trebles into the next, four chain, one single into each of ten

FIG. 461.

successive picots, three trebles between the four trebles of last row, four chain, one single into the same place, four chain, pass over two picots, one single into the next, three trebles into the place the last were worked into, four chain, one single into the same picot, seven chain, one single into picot of heading, six chain, pass over one picot, and repeat from the beginning of the row.

For the heading:

Wave a length of mignardise as shown in the design, and draw the picots together with a needle and thread, passing the thread at the back of the work. This is joined to the edging on the other side of the heading; work one single into the centre picot of a scallop, six chain. Repeat.

FIG. 462.—BASKET FOR SOILED COLLARS CUFFS, &c.

The basket, which is in the shape of a barrel, is of wicker, on a stand of black bamboo. It is lined with blue cambric, and ornamented with bands of art-canvas, embroidered with crewels in cross-stitch. The top of the basket is ornamented with a quilled ruche and bows of blue ribbon.

FIG. 464.—INSERTION: CROCHET AND FANCY BRAID.

This pattern is suitable to be used as a stripe for antimacassars, &c., inserted between other stripes of embroidery, ribbon, &c.

For the centre; One treble into the second, third, and fourth picots on a medallion of braid (keep the top loop of each treble on the hook), one treble into the fifth picot and second picot on the next medallion together, one treble into each of three next picots; take another length of braid and work in the same way as described on two medallions, keep all the loops on the hooks (see design), and draw through altogether; fasten the cotton firmly at the back of the cluster; the picots in the centre of the bar of mignardise must be joined with a needle and cotton.

2nd Row: For the stars: On the other side of braid work two double trebles into the fifth picot on a medallion, keep the top loop of each on the hook, and draw through both together (as all the double trebles are worked in this way we shall not repeat the directions); pass over two picots, two double trebles into the

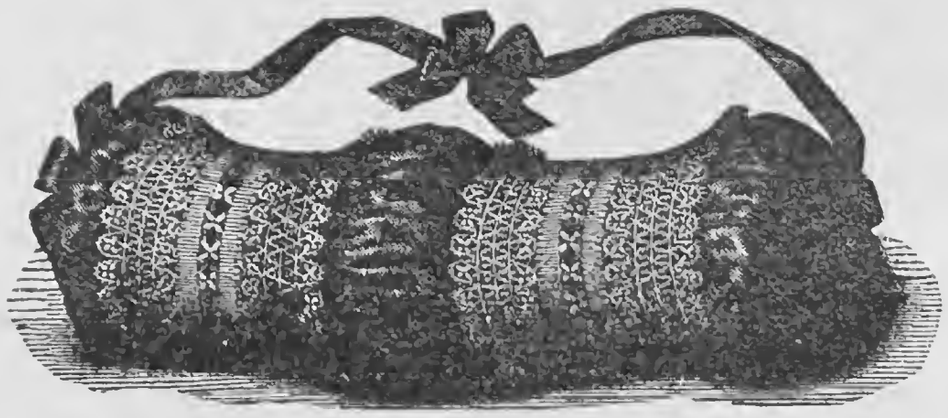

FIG. 460.

For the lace, take a length of mignardise, and work one single into each of three successive picots, drawing through the top picot of heading mignardise, six chain, draw through the centre picot on next scallop of heading, seven chain, pass over one picot, one single into the next, pass over four picots, two double treble into the next, pass over two picots, two double trebles into the next; take another length of braid, and work upon it the second half of star as directed for the first; fasten the cotton off at the back of the work; fasten the two short bars between the medallions together with a needle and cotton.

For the edge:—

1st Row: One double into two picots together over the short bar (see design), three chain, pass over one picot, one double into the next, four chain, pass over one picot, one double into the next, five chain, pass over two picots, one double into the next, four chain pass over one picot, one double into the next, four chain, pass over one picot, one double into the next, five chain, pass over two picots, one double into the next, four chain, pass over one picot, one double into the next, four chain. Repeat from the beginning of the row.

2d Row: One double treble into the first four chain of last row, two chain, one treble into the centre of next four chain, three chain, one half treble into the centre of next four chain, three chain, one half treble into centre of next four chain, three chain, one treble into centre of next chain, two chain, one double treble into centre of next chain, three chain. Repeat from the beginning of the row.

3d Row: One treble separated by one chain into every other stitch of last row.

The other side is worked the same way.

FIG. 463.—CLEMATIS PANEL.

This design for panel decoration shows an artistic arrangement of this pretty vine and flower, and is here given to aid nature's imitators when such work is contemplated.

Much skill is required in reproducting to exactness the fine stamens of the flowers, consequently, there is a lesson in the correct accomplishment of this representation.

A Table Cover.

Material, one yard old gold momie cloth 1-2 yd "oat meal" momie cloth, and 4 1-2 yds. black velvet ribbon, 1 1-2 inches wide. The oat meal cloth is used for the borders; it is fringed at the lower part as deep as you please. The velvet is put on over the seam with invisible stitches, and is crossed at the corners reaching the edge of the cloth where it is folded to a point and finished with an old gold tassel made of ravelings of the cloth.

FIG. 462.

Cut a pattern of a clover leaf and mark it, or stamp it around the cloth, putting the designs an inch and a half apart on the "oat meal" border with a long stem extending upon the velvet. Work it in clouded yellow or green silk, "satin stitch," or if you wish it less expensive use worsted, and from the point of the middle leaf of every second clover suspend a tassel of the old gold ravelings.

Finish the centre of the cloth with a monogram.

Having finished it, you will know that the cover has cost labor, but you will be sure to think it has paid. O. W. D.

HAND-SHAKING.

The following method of shaking hands is from the pen of Charles Lamb who describes the observances in a humorous way.

"The *pump-handle* shake is the first which deserves notice. It is executed by taking a friend's hand, and working it up and down, through an arc of fifty degrees, for about a minute and a-half. To have its native force and character, this shake should be performed with a fair and steady motion. No attempt should be made to give it grace, and still less variety.

"The *pendulum* shake may be mentioned next, as being somewhat similar in character, but moving as the name indicates, in a horizontal instead of a perpendicular direction. It is executed by sweeping your arm horizontally towards your friend's, and, after a junct-

ion has been effected, rowing with it from one side to the other, according to the pleasure of the parties.

"The *tourniquet* is next in importance. It is preformed by clasping the hand of your friend as far as you can in your own, and then contracting the muscles of your thumb, fingers, and palm, till you have induced any degree of compression you may propose in the hand of your friend.

"The *cordial grapple* is a shake of some interest. It is a hearty, boisterous shake of your friend's hand, accompanied with moderate pressure and loud acclamations of welcome. It is an excellent traveling shake, and well adopted to make friends. It is indiscriminately performed.

The *Peter Grievous* is opposite to the *cordial grapple*. It is a pensive, tranquil junction, followed by a subsultory motion, a cast-down look, and an inarticulate inquiry after your friend's health.

The *prude major* and *prude minor* are nearly monopolized by ladies. They cannot be accurately described, but are constantly to be noticed in practice; they never extend beyond the fingers; and the *prude major* allows you to touch them only down to the second joint. The *prude minor* allows you the whole finger. Considerable skill may be shown in preforming them with nice variations; such as extending the left hand instead of the right, or stretching a new glossy kid glove over the finger you extend.

MY INDEX.

About the year 1860, after going through work after work, and volume after volume, to find authorities which I knew that I possessed but could not locate, I conceived the idea of an alphabetical index naming the subjects in their order and referring to the volume and page for a description or for authority. Consequently I purchased a blank book of 280 six by fifteen inch pages, lettered each page at its head, writing the subject on the left hand and the reference on the right. The subjects are mainly agriculture, entomology and climatology with a sprinkling of all other subjects. Thus under the head of Worms there are 24 entries, naming some 15 kinds and referring to as many works for descriptions.

It often occurs that I wish to preserve something that I find in a newspaper that I do not intend to keep. The latter part of the book is devoted to this use and the article cut out and pasted in or its main part written and its page referred to in the index. Thus I have stored up a mass of most valuable information at little expense of time or labor.

At the time of getting up this work I had never heard of such a thing but I subsequently learned that it is somewhat common and that blank books are published under the head of *Index Rerum* for this very purpose and my object in speaking of this matter here is to recommend their use to my fellow readers as being something which they will find of great convenience and value. S. B. P.

USEFUL HINTS.

Black silk is restored to its deep black color by sponging it with a decoction of common cheap black tea, which contains all the ingredients of a black dye, viz., tannin and iron, with usually some logwood to add to the flavor. The silk is then ironed with a moderately hot iron on the wrong side or placed between two sheets.

To Perfume Linen.

Rose leaves dried in the shade, cloves beaten to a powder, mace scraped. Mix them together, and put the composition into bags.

Bran on carpets.—Take a pint of any coarse bran—a pint is sufficient for an average room—dampen with as much water as it will hold without dripping, being wet enough to make "splashes" on the carpet, sprinkle it over one-half the carpet, then commence next to the wall and sweep the bran over the other half. Keep your shoes off the bran. When the sweeping is finished the bran, if rightly operated, will have absorbed the dust, and the furniture will be easily rubbed over. This applies to ingrain, rag, or other than Brussels, and will not soil the finest fabric, wall or paper.

September is the month for gathering ferns. Take an old book with you to the places where they are gathered as they must be pressed directly after picking to preserve perfectly. In selecting do not pass the "baby" ferns as they will be found to be as effective for decoration as the larger ones.

A pretty little device for window decoration, is a spouge suspended by a fancy cord. Dampen the sponge and sprinkle flax, mustard and other seed over it, this seed will germinate and the result will be a mass of beautiful green. Flax seed is the best to use. The sponge can be washed and replenished with seed when decay takes place.

It is the small leaks that impoverish a house-hold. It is the small economies that lead to affluence.

When, from sedentary habits, the muscles are emaciated and the digestive system disordered, an excellent method for restoring the patient to health and full weight is for him to be charged with electricity, applied through the handle of a spade, a hoe, an axe, or some similar instrument. Apply it daily, and for some hours at a time.

To make the colors stand in washing lisle thread and delicate cotton hose.—Turn the stockings right side out, and wash in a lather of lukewarm water and white Castile soap; then wash the wrong side. If very much soiled two waters will be required. Rinse in lukewarm and then in cold water; dry as soon as possible by heat, not by sun. It is better not to iron them, but when nearly dry, smooth and pull them into shape by hand.

Never ask a sick person what he will have to eat. Give a variety if possible, and by all means serve the food, if only tea and toast in the very daintiest manner.

Ferns, well pressed and dried, and then painted thickly with liquid gold paint, are sometimes applied with good effect to the doors of a cabinet. One who has tried the experiment and succeeded says: "After gumming the backs, I arranged them on the panels of the door, pressing them with an old soft cloth. Where the gold paint moved off, I painted it again when dry. Lastly, I carefully laid on a wash of clear varnish, doing it as quickly as possible. This preserves the ferns and gilding, and improves their appearance."—Art Amateur.

A recent improved receipt for preserving plants with their natural colors is to dissolve 1 part of salicylic acid in 600 parts of alcohol. heat the solution up to boiling point in an evaporating vessel, and draw the plants slowly through it. Shake them to get rid of any superfluous moisture, and then dry between sheets of blotting-paper, under pressure, in the ordinary manner. Too prolonged immer-

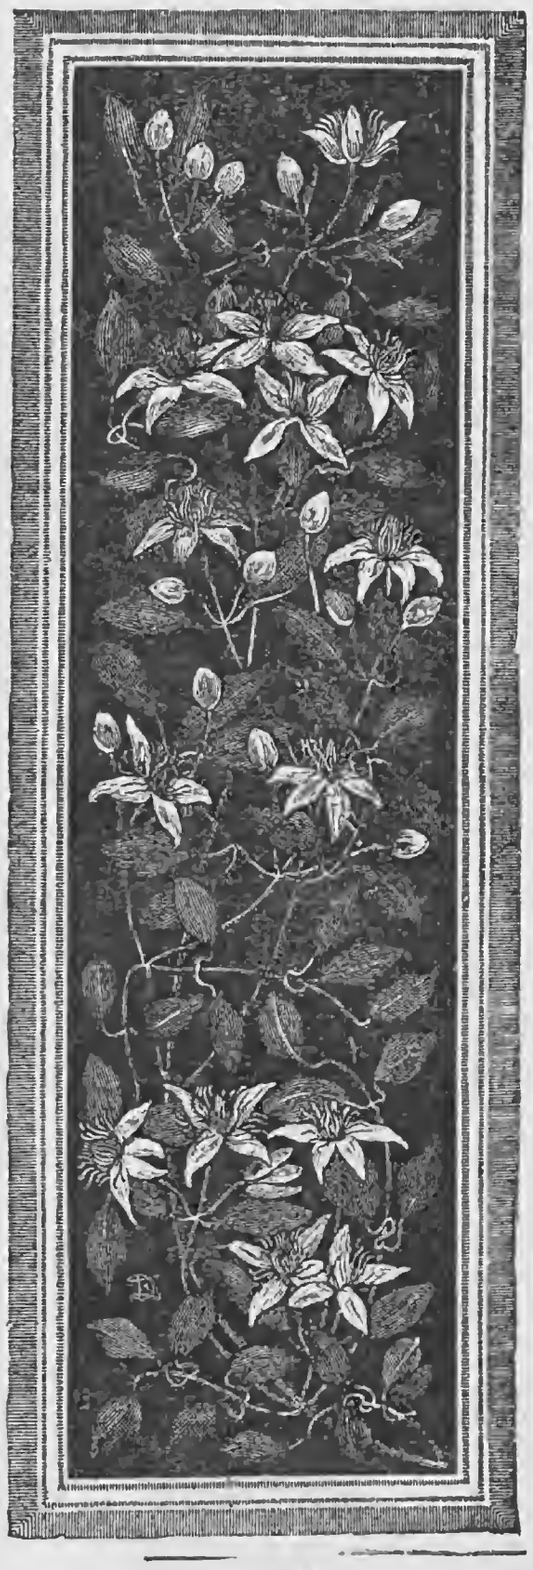

FIG. 463.

sion discolors violet flowers ,and in all cases the blotting-paper must be frequently renewed. The novelty appears to be the salicylic acid.—Art Amateur.

An excellent remedy when the finger or part of the flesh is burned, is to wrap it in raw cotton. The effect is severe for a short time, but is effectual. Sweet oil is often used with the cotton, but the latter is all that is necessary to remove the fire.

Ditman's Sea Salt is very beneficial for bathing, also for strengthening weak spots. Take a large handful and dissolve in about one quart of water; bathe with it, or saturate a cloth with the solution and bind on the affected part. A quantity put in the tub when taking a bath is good. There may be other preparations of the article but the above is the only one recalled.

ABOUT WOMEN.

Benjamin Asbury Goodridge, of Boston University is elected Instructor in Latin and Greek at Lasell Seminary for women.

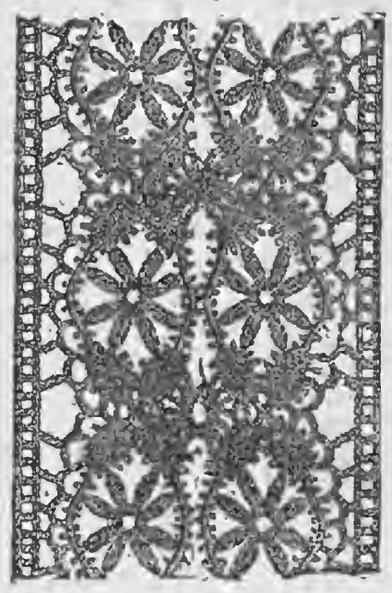

FIG. 464.

The late deceased preacher, E. H. Chapin bequeathed his entire estate to his wife. It is but a short time since the will was proved, and now that wife is laid by his side.

Mrs. Williams, of Norwich, Connecticut, has left a fund for the building and endowing of a school for young ladies in New London, which is now valued at $100,000 in personal property, and $25,000 in real estate, besides the site, which is worth $10,000.

The lecture of Mrs. Hathaway, of Chicago, before the School of Philosophy at Concord, upon "Schopenhauer," was a clear and concise exposition of this German philosopher's theories. Mrs. Hathaway is a German by birth, and has a strong analytical mind and a mastery of German thought which places her on a level with the other thinkers of the Concord school. The ladies who attended her lecture were proud of their representative.—*Transcript.*

Literary.

MORAL COSMETICS.

Ye who would save your features florid,
Lithe limbs, bright eyes, unwrinkled forehead,
From age's devastation horrid,
Adopt this plan:
'Twill make, in climates cold or torrid,
A hale old man.

Avoid in youth luxurious diet,
Restrain the passions' lawless riot;
Devoted to domestic quiet,
Be wisely gay:
So shall ye, spite of age's flat,
Resist decay.

Seek not in Mammon-worship pleasure,
But find your richest, dearest treasure,
In books, friends, music, polish'd leisure;—
The mind, not sense,
Made the sole scale by which ye measure
Your opulence.

This is the solace, this the science,
Life's purest, sweetest, best appliance,
That disappoints not man's reliance,
Whate'er his state;
But challenges, with calm defiance,
Time, fortune, fate.

THORNS AND ROSES.

(Continued from page 626.)

CHAPTER II.

The morning after my arrival I visited the garden, delighting in the cool air, the roses were heavy with dew, and flowers and leaves glittered with the same diamond-drops. I returned to the house, to find aunt Dorothy waiting breakfast for me, and I inquired when my cousin would arrive.

"About noon, I think. I shall send someone to meet her, unless you would like to do so? You could manage the pony-phaeton perhaps, and in Stanton no one makes disagreeable comments on what *we* do."

"I can't say that I mind conventionality, aunt, anywhere, and I love riding and driving. You will come?"

Aunt Dorothy declined; Edith and I should get on better without her at first, she thought, but to console me for the disappointment, she asked me to go to the garden with her, as there was something she wished to show me. We went out, but instead of lingering among her flowers, she led the way to the stables, where I was at once attracted by a beautiful black horse.

"That is yours, Kate; see how well I know your tastes! Brandon selected him, and we named him Black Diamond.

It was useless to try to thank aunt Dorothy; to all expressions of gratitude she turned a deaf ear, saying, "I am thanked if you are pleased;" but she understood me, I am sure.

We returned to the flowers, and gathered a fresh bouquet; and then entered the house, it being aunt's custom to dust her china, too precious to be entrusted to a servant; and this done, she had to consult on preserves and pickles with her old housekeeper, so I was left to myself. The morning passed quickly, and soon I was prepared to meet my cousin. I drove away merrily through the lanes, receiving stray curtseys, and hearing sentences to the effect that "Yon was Miss Lovel." Everything had an attraction for me, from the thatched cottages to the noisy ducks on the wayside ponds. I drove through the village until once more I saw the white railings of the station; and leaving my equipage in charge of a flaxen-haired laddie ascended the steps.

The train was in; among the homely-faced women, bearing great baskets, and sunburnt laborers with red bundles, I certainly did not look for my cousin. One lady was arguing with a porter; another stood laughing and talking with a gentleman slight and young; and as I could not see the face of either, I hesitated. But my doubts were soon solved; the latter-mentioned lady turned away, and seeing me, gave a long stare, then crossed the platform quickly. At once I recognized Edith Lovel from the likeness to her mother. She was of medium hight, and slender in figure: her eyes were bright, under straight, delicate brows, her hair fair:

"Coral on coral her lips did meet,
Or parted, to show the gleam o' the pearl;"

Altogether she was very pretty, very graceful, and attired in the hight of fashion; she advanced, surveying me from head to foot as she came, and greeted me without ceremony.

"You are cousin Kate! I thought so. Did aunt send you? Do let us get off this stupid station."

I explained my fondness for driving, and hoped the journey had been pleasant, as we descended the steps, soon discovering that my cousin was gifted with peculiar frankness.

"I hope we shall like each other," she said; "I don't know whether you go in for dignity or ceremony, but it is so absurd for cousins to meet stiffly, that I'm going to be as though I had known you all my life. You're a model, aunt tells me, and you will soon find me out. Do you agree to my proposal?"

"Willingly," I replied, charmed by her fresh, off-hand manner.

"That's settled," she cried, as I gathered up the reins. "Don't drive straight home, because I want to talk to you; and I shall fall into boredom's clutches if we go home."

Thus commanded, I went in an opposite direction, Edith rattling on with wonderful vivacity.

"What kind of a girl did you expect to see, Kate? Edith would lead you to imagine some one dark and dignified, I suppose. Everyone says my name does not suit me, but it is a thousand times better than these hideous, old-fashioned Dorothys, Barbaras, and Catherines—I beg your pardon—in which the Lovel ladies rejoice. What do you think of our home?"

"I like it; it is only natural that I should."

"Are you what aunt Dora would call a genuine Lovel? The place is horribly dull, and I speak from experience. I should not have come now, only I wanted to see what kind of a girl Kate Lovel was."

"And now that you do see her, what is your opinion?" I asked, much amused.

"You have not seen as much of the world as I have, for really I have knocked about. I daresay you know that I can't live at home. Papa is kind enough, but his wife is very religious, and it is as much as I can do to be civil for a week. There are ever so many little ones, and I can't amuse them—children are such a nuisance—so papa always seems glad when I am invited anywhere, because, he says, there will be peace. He spoiled me until he got someone else, so I go my own way."

"I wonder that you don't live here."

"Thanks—it is too quiet. Aunt is a dear old body, but don't you think she gives one too much Lovel? I generally fall asleep in the midst of those tremendous legends. Papa says that if I play my cards well, she will leave me her money. But people tell me that I am the image of mamma, so I think aunt must dislike me."

"I don't think aunt could dislike anyone," I replied, and Edith laughed.

"How bluntly you speak! I'll stay awhile and see if there's any amusement to be had. I am sorry there is no society."

"Is there not Brandon?" I asked.

"Brandon! What amusement, my dear girl, could anyone have with Brandon, a melancholy, grave-faced old man, buried alive in books and musti-fusti papers, always reading, writing, and studying?"

"I thought you liked him?" I said.

"Oh! he's kind enough; but he seems to

look on me as a baby. Once I spent my birthday at aunt Dorothy's, and I expected that he would send me a doll. But, really, he is a marvel of patience with aunt; when I used to sleep in the summer-house, he would mope indoors, winding her knitting-silk, perhaps. What do you think of that?"

"I think very highly of Brandon," I replied; "and some day he will be rewarded for his reverence to age."

"What a queer girl you are, to be sure! What do you think of him personally? Would you call him handsome?"

"I have not seen him since I returned."

"Nor Nevil Verner, I suppose, the 'king of men,' who makes the second in our limited circle?"

"Could you not visit his home if you were so dull, Edith?"

"Why should I? My dear Kate, if there is a man on earth whom I detest, that man is Nevil Verner! Don't look shocked; we all have a pet aversion, and he is mine. I did visit his mother, but I can't stand a sick-room, and I quarreled with Nevil. I can't bear him, for he is the most selfish creature on earth."

"Your likes and dislikes are very vigorous, Edith. Are you as candid in Mr. Verner's presence?"

"Certainly; he likes flattery, so I never give him any. His chief feature, mentally, is selfishness."

I ventured to say that he was at least unselfish in visiting Aunt Dorothy and reading to her, at which my cousin laughed scornfully.

"You have had aunt's tale, I see. How often does he condescend to visit her, and would he do so if she were not the rich Miss Lovel? He will read to her for five minutes, then look at his watch, and remembers either that he has an appointment or that Mrs. Verner will be anxious; he leaves a book if he doesn't want it himself. And to hear aunt thank him does exasperate me, because I know he would not do it if it cost him anything. His mother thinks him wonderful. Of course, he is the best of sons; if he is not reading, shooting, driving, or visiting, he will go to his mother's room for a few moments, and if the poor lady asks him to remain, will do so with such a martyred face, and such sweet resignation, that she believes herself exacting and selfish."

"You do more than he does for aunt?"

"A cruel question, Kate," she laughed, "but I do not affect benevolence. I admit that I am lazy and selfish; I'm not good, but I am not hypocritical. You'll find Nevil out for yourself though, as his visits will become frequent when he knows there's a new face here. Be warned in time; he's one who will value anything very highly until he gets it."

I looked at her and she answered the look.

"Your suspicions are right. When first I came here, I thought I might do worse than take Nevil Towers and rent-roll, and we two, both 'tall and fair and slender,' commenced a mild flirtation, which, was nipped in the bud by myself. I took an intense dislike to him and quarreled with him, so ever since a dreary sea has rolled between; if I had engaged myself to him then, he would at once have tired of me."

"You have drawn flattering portraits of Mr. Verner and Brandon, so don't spare me."

"I have only said what I think, and I have not decried Brandon, though papa thinks he has too much influence over aunt. By-the-way, how did she like resigning the chair of state to you, for you are mistress?"

The property is certainly mine, but aunt Dorothy is its mistress now, as she always has been."

"Queer girl! If I had a house like that, everyone should acknowledge me as mistress."

"If you were in my place, you would do as I do. Nothing will tempt me to usurp her place."

"She'll think house, lands and money her own."

"I hope so," was my answer, and with a dry cough, Edith turned the conversation.

"Did you wonder who my railway hero was? We got into conversation *en route*, and he was deeply interested in the history of the Lovels. I excelled even aunt Dorothy in some of my legends."

I began to remonstrate, but she laughed.

"You would have stared through the window, deaf and dumb, I suppose; but I did not, and my companion was very agreeable. He ——home at last, Kate."

We drove on rapidly to the entrance, Edith alighting first, and making a frantic rush at aunt Dorothy, who stood awaiting us.

"Don't look at me, aunt!" she cried, with a passing embrace; "because I am not fit to be seen. I hope you didn't give Kate the blue room?"

"No, it is ready for you as usual."

Whereupon Edith left me alone with aunt.

"Edith is in good spirits," she said, looking pleased; "I do hope you will like each other!"

A dainty luncheon was ready, but we had to wait some time ere Edith reappeared. She came at length, with a costume exquisite in make and material, setting off her graceful figure and fresh beauty; in her glance even there was an undefinable charm, and I looked at her with admiration.

"Like my dress?" she said, calmly. "Don't think I waste these lovely costumes. I scatter bread on the waters, and some day it will return to me in the shape of a rich husband."

"My dear, you know I dislike that style of conversation," said aunt, gravely, and Edith was silent.

She had a bright, shrewd face, and I thought could be very pleasing when she deemed it worth her while; and from the fact of her being almost perpetually in society was never embarrassed or at a disadvantage.

From her school-days until now she had lived in gaiety and excitement; and it was not hard to see that she had been taught to regard marrying well as the sole aim of existence; when I remembered that her home was not home, that she had no mother's love to help her. I might have pitied her, but her bright vivacity forbade it; when she yawned over aunt's stories, I might have been annoyed with her, but her serene good temper forbade it; whether she was shallow or the contrary I could not tell, but undeniably she was fair, graceful and clever.—To be continued.

If "the proof of the pudding is in the eating," where shall we look for the proof of a printers pie?—Philadelphia Bulletin.

No good health with thin impure blood. Hop Bitters makes rich blood, good health and strength.—*Adv.*

Domestic Economy

CONDUCTED BY EMILY MAPLE.

A SOUTHERN HOUSEHOLD.

MARY WAGER-FISHER.

I LATELY spent a fortnight in the house of some friends in Maryland, and was particularly impressed—as I am always when with them—with the peculiar happiness of the household—the merry light-heartedness of each and all, their genial, kindly ways, and the every-day "religion" of their lives. The house itself, a spacious building with wide piazzas extending around both the first and second stories, bespeaks true Southern hospitality, and I wondered, as I always do when in such a house, that so few country houses have an up-stairs piazza, which is both a great delight and a great convenience in many ways. The great kitchen, with shelves, closets and store-room, was separate from the main building, being connected with it by a covered hall or passage-way, and none of the flavors or fumes from it were perceptible in any part of the building. The house-work, of which there must be considerable in a family of nine or ten with much company, seemed to do itself, so far as any friction or trouble from it was visible.

This was, in large part, due to my hostess, who for faculty might well have laid claim to be a Yankee of the Yankees. I knew that the delicious bread, and that most of the prepared delicacies of the table were the work of her hands, but when she spent an hour in the kitchen was always a mystery. Her perfect tact, her great good humor, her sense of the ludicrous, acted like oil on the wheels of the kitchen machinery, and when work dragged, things went wrong, and the cook worried, her merry laugh and some witty speech set everything running lightly again. How much a spirit of fun, and a bit of cheery, hearty laughter sometimes will mend broken places and heal a chafed disposition.

What seemed to be one great source of the cheerfulness and joy of the household, was its faith in the goodness of our over-ruling Providence. A dear little daughter who died two years ago, was often talked of, her childhood sayings quoted, but there was no spirit of repining or sorrow that Rosebud had left them. "Before Rosebud went to heaven" was spoken of as a date, in the same way as, "before last Christmas." In the afternoon, every member of the family at home retired to her chamber for a two hour's rest, and the house was quiet. At five or six o'clock all convened on one of the great piazzas where each recited a Scriptural verse, and then all repeated the Lord's Prayer in concert. That was all of the little evening service. At table, one of the children usually said a little form of grace in which the others joined. In this way a spirit of thankfulness and of trust was as much a part of their daily living as their daily bread. What came was for the best, or would work out something for the best. The mother, a woman of remarkable charm and attractiveness, as well as a woman of great wit, made use of her Bible in every emergency of her life—if troubled, or in doubt, she would fly to its pages and whatsoever her eye sighted upon, she usually found to be applicable to her case, and she accepted it as a guide for her actions. She has the grace and the faculty to extract the sweetness and beauty out of any and every surrounding in which she might be placed. With her, life is more than meat and the body more than raiment, although her own raiment is "purple and fine linen," and I wished more and more as the days went by, that all tired, worried and perplexed housewives in the country could see her and be with her long enough to learn "Wisdom," or at least to trust something to Providence, enough to secure a little peace and serenity for themselves.

ON RENOVATING.

ANNIE L. JACK.

I STOOD looking, one morning, at a table cover that had seen service in the sitting-room for many years. I have an affection for old though inanimate household goods, and this cover was one of my favorites. But it was unmistakably soiled, and I saw marks of sperm grease from stray candles and other discolorations. The colors were red and green, and I decided that what was to be done must be done quickly. So I made a suds of the best of soap and *warm* water (not hot); gave it one good washing, and a rinse in cool water into which was dissolved a small piece of alum. It was not ironed, but well shaken, and great pains were taken to pull it into shape, two of us taking it from the cord when partly dry and gently holding the selvedges into shape. The result was satisfactory—the cover retains its color and is the better for its washing.

A day or two later I had cause to attempt another renovation. The girls of the household going to a new church but lately dedicated for worship, found that their dresses of white mull stuck to the varnished seats one sultry July day. Water would not move the yellow stuff, and I caused the soiled part of the dress to be dipped in turpentine, then well soaped and soaked in warm water. The result was that every mark disappeared. A black silk was cleaned with benzine; but a pale-colored silk, though cautiously sponged, lost some of its color and luster. Baby took it into her head to explore the hub of a carriage wheel, and smeared her white dress; this stain was also removed by the turpentine, and fruit stains by chlorine water, while stains of mildew were removed by soaking in buttermilk before washing.

OUR WAY OF PACKING SMALL QUANTITIES OF BUTTER.

MAY MAPLE.

"ISN'T it a shame to sell butter for ten cents a pound?" said a neighbor, upon whom I had called.

"Yes! it does seem a pity to put in so much labor for so small a price; but why do you do so?"

"Why; what else can I do? we only keep three cows; but then we cannot use all the butter we make."

"Can't you pack it down in jars and keep it till Fall or Winter? You know good butter always brings good prices then."

"Will it keep?" said she earnestly.

"I never have any trouble to keep it till people know I have it to sell. Then I often wish I had a great many pounds more; for it is like the old lady's new bread, it goes like the dew, and it is just as sweet in Spring as when first made."

"Do tell me how you manage, and I'll try it."

"In the first place I am careful not to pack any but sweet, firm butter; no soft, oily, frothy stuff, such as one sometimes makes when the mercury ranges up to 93 deg. or 96 deg. in the shade; that will not keep, and a few pounds will soon spoil really fine butter that may be put with it. When it is taken from the churn, it is thoroughly rinsed in pure, cold water direct from the well, then salted, and slightly worked. It then stands an hour or two, in a cool place for the salt to dissolve when it receives its final working, or pressing, to extract the last drop of butter-milk. Still I do not work the butter till it is perfectly dry as that often spoils the grain. I like to have it sweat when the brine will stand out over it in tiny drops as clear as crystal. A handful of nice, fine salt, such as I use for salting the butter, is strewn over the bottom of the jar, and the butter packed in as solid as possible. A cloth wet in cold water, is spread over the butter, and a layer of salt on the wet cloth. When the jar is filled rounding full, I take a fresh cloth wet as before, and fit it nicely over the top of the butter and cover it thick with salt; over this I turn a plate and press it down close, so it will be as nearly air-tight as possible; now a dry cloth and paper are tied over all to keep out dust, and it is put into the cool, dark cellar and kept till the Winter or Spring following, when it is greedily snatched at by customers, who are willing to pay the highest market price for it. This has been our way for years."

Canning Tomatoes.

I have had the same experience with my canned tomatoes that Mrs. Fisher wrote of, until the past two years. A niece staying with me at that time told me that the tomatoes had soured before they were canned. Pick the fruit before it is fully ripe—there should be a small spot of green around the stem—and can at once. They should not stand an hour after picking. Cook thoroughly. It makes but little difference what you put them in so long as they are air-tight. I have put them into gallon jugs, using corks or corn-cobs that would fit tight. Cover the tops with a cement of resin and beeswax—three parts resin and one part wax or tallow. I have also kept them as well in gallon jars, covering the tops with cloth and cement. SUBSCRIBER.

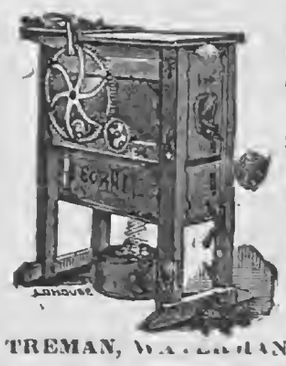
Indigestion, weak stomach, irregularities of the bowels, cannot exist when Hop Bitters are used.—*Adv.*

Miscellaneous.

PROFESSOR HORSFORD'S PHOSPHATIC BAKING POWDER

Made from Professor Horsford's Acid Phosphate.
Recommended by leading physicians.
Makes lighter biscuit, cakes, etc., and is healthier than ordinary Baking Powder.
In cans. Sold at a reasonable price.
The Horsford Almanac and Cook Book sent free.
Rumford Chemical Works, Providence, R. I.

Improved Cornell Corn Sheller.



FOR 1881.
Will shell *more* corn with *less labor* than any other machine in market.
The only Sheller made
THAT USES
Spiral Springs for the Pressure Bar.
Every Machine Warranted to do as good work
As any Sheller Made
☞ Ask to see the Cornell Sheller, try it and you will buy no other.
Address orders to
TREMAN, WATERMAN & Co., Ithaca, N. Y.

$5 to $20 per day at home. Samples worth $5 free. Address Stinson & Co., Portland, Me.

$72 a week, $12 a day at home easily made. Costly outfit free. Address True & Co., Augusta, Me.

News of the Week.

HOME NEWS.

MONDAY, Sept. 12, 1881.

On Tuesday the 2d., the President was successfully removed to Long Branch. The accommodations for his removal were most complete and he stood the journey remarkably well. On Saturday the 10th., an affection of the right lung was discovered, which it is thought may prove to be an abscess. The parotid gland is doing well, but there is much fear, as we go to press, as to the effects of the lung difficulty. Mr. Blaine's cablegram to Minister Lowell at 10.30 last night was far from encouraging.

The Governors of most of the States of the Union issued proclamations that Thursday, the 8th inst., be observed as a day of prayer for the President's recovery. In some places Tuesday and Friday were set apart as days for special prayer. These days were very generally observed throughout the country.

The universal, omnipresent Smiths have had a reunion at Peapack, N. J., about 3,000 descendants of the original John Schmidt being on the ground.

An aerial voyage in a balloon will be made this week by Prof. Samuel A. King, Winslow Upton, of the U. S. Signal Service, and several representatives of the press. The voyage will be from Minneapolis, Minnesota, to the Atlantic seaboard. Useful scientific results are expected from experiments to be made.

Michigan has suffered terribly from forest fires the past week. It is reported that 20 townships have been burned out, over 2,000 families made destitute of a home and 300 lives lost. The greatest suffering is in the vicinity of East Saginaw. An appeal to the people of the United States has been issued and material aid has been rendered the unfortunate people.

An express train on the Chicago and Alton R. R. was stopped and robbed by 16 masked men, on the night of the 7th. They forced the express messenger to open the safe, and with a guard stationed on either side of the train five or six of the robbers went through the train demanding the passengers money and other valuables. Seven of the robbers have been arrested up to this writing. The entire country is aroused and under arms, searching for the desperadoes. The exact amount of money and valuables taken cannot yet be stated.

Drs. Reyburn, Woodward and Barnes and Mrs. Edson who have been in attendance on the President have retired, leaving Drs. Bliss, Agnew and Hamilton in charge. The cause for this action was the President's belief that three medical attendants would be sufficient.

Gen. Wm. T Sherman was in Worcester, Mass. on the 7th. inst. by invitation of the Agricultural Society. He delivered an address at the annual Fair.

New London Conn. has been celebrating the one-hundredth anniversary of the battle of Groton Hights. Edward Everett Hale delivered an address fitting to the occasion.

The hottest day known in this city this year was Wednesday the 7th inst. when the thermometer marked 108° in the shade. There were several cases of sun-stroke. In Baltimore and Philadelphia the temperature was 100° Pittsburg 99°: St. Louis 97°: Boston and Albany 96°.

The Social Science Association, lately in session at Saratoga, has elected Prof. Francis Wayland, of New Haven, President for the ensuing year.

The White House is now closed for repairs and presents a deserted appearance.

Another land mark in the Metropolis will soon disappear, to make way for the "march of progress." Cyrus W. Field has bought the property at Broadway and Battery Place, long known as the Washington Hotel. It has historical interest as the oldest building now standing in this city. Mr. Field will erect a building ten stories high, of Milwaukee brick, with stone trimmings. It is to be fire-proof throughout. The old house, which will have to give way to this modern improvement, was built in 1742, and is locally famous as having been Washington's head-quarters while the Father of his Country resided here.

A curious phenomenon was noticed, on the 5th, in various middle and New England States. The sun was obscured and the atmosphere glowed with a yellow glare. Artificial light was in demand in some portions of this State in the afternoon. In Boston a base ball game was stopped at 4 o'clock in the afternoon, on account of darkness, and in Providence, R. I., the factories quit work at 2 o'clock, because of the unnatural gloom for which the gas companies had made no preparation. In Utica, N. Y. the phenomenon began Monday night, when the moon, altho' nearly full and obscured by no clouds, cast no perceptible shadow, having the appearance nearly of a copper disk. The street lamps not being lit, it was difficult to see five feet ahead, when there were no store lights shining on the sidewalk. The unusual darkness continued almost up to sunrise, and there was a lack of light for some hours afterwards.

William Martin, a Rondout, N. Y. mechanic, has just fallen heir to an English estate valued at $7,850,000, left him by James McDermott whom he befriended two years ago when a poor immigrant. McDermott acquired the property thro' an uncle's death a short time ago.

Elias Champlain, Supervisor of the Town of Liberty, Sullivan County, N. Y., while engaged in burning brush, was burned to death by his clothing taking fire. The body when found was almost unrecognizable. He was 65 years of age.

Second Assistant Postmaster General Elmer reports a net reduction in star-route and steamboat mail service during August amounting to $98,337, and that the total amount of reductions and discontinuances since March is $1,479,779.

The steamer Wyoming, from Liverpool, on the 2d. instant, for New York, brought 550 Mormons for Great Salt Lake, from Great Britain, Switzerland and Germany, the latter two countries contributing over 200. Including the foregoing more than 2000 Mormons have left Liverpool this Summer. Another contingent will come before the season closes.

The entire length of Chestnut Street, Philaphia, is to be illuminated by electricity. It is the largest contract of the kind that has yet been entered into in this country.

Mr. Rudolph, brother of Mrs. Garfield, says that his sister's faith has always been strong regarding the President's recovery, and she expresses implicit confidence in Dr. Bliss and his treatment of the case.

W. H. Vanderbilt has presented the Railroad Young Men's association of Troy with $500 towards defraying the cost of a new building to be erected for the use of the association.

The enormous increase in the freight business on the western division of the Central Railroad in the past four years is shown by the following figures: The number of freight cars moved over the division during August last was 130,655, comprising 2,689 trains both ways. The number of cars in 1877 over the same division was 72,003, comprising 1,817 trains.

Protection from Disease.

The following, which we take from a letter received from one of our old patients at the South, dated June 5th, 1880, shows the effect of Compound Oxygen in keeping up vitality under circumstances of great fatigue, loss of rest, exposure to fever, and all the depressing influences attending on the sickness and death of near and dear relatives. "For ten weeks my sister and I nursed our father (the late Judge) constantly, day and night, she losing one-half and I the other of each night. I took the Oxygen regularly twice a day, and though feeble and much exhausted did not have any symptoms of fever; while my sister who did not use the Oxygen at all, took the fever and died. She too was very delicate, but I do not believe she would have had the fever if she had been using the Oxygen. We used every precautionary measure in the way of cleanliness, pure air, wholesome food, etc." Our Treatise on Compound Oxygen, containing large reports of cases and full information sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

CONTRIBUTIONS FOR THE RELIEF OF THE MICHIGAN SUFFERERS may be sent either to the Michigan Relief Commission, William Doud, Treas., Bank of North America, New York City; or to Waldo M. Johnson, Joseph Stanard, Henry Newland, Gen. G. S. Wormer, or James Buttenshaw, who act as Relief Committee in Detroit, Mich..... By Friday's and Saturday's telegrams to the N. Y. papers we learn the following: At Portland, Me. half a million cans of corn have been already put up.....The wool market at Boston is excited and the sales for the week ending Friday footed up 5,751,500 pounds—nearly twice as much as the largest previous week's business during the year. Domestic fleeces are firmer and a shade higher..... In Providence, R. I., Cotton is strong— middling upland 12½c.; middling gulfs, 12¾.... In Buffalo, N. Y., the fruit trade, owing to dry weather, is greatly reduced and prices are higher than last year. Prices of wheat are tending upward. Canal freight on wheat 4½c. per bushel to this city: on corn, 4c..... Prices of grain in Philadelphia are unsettled owing to impending advances in storage rates by the Elevator Company. About 1,500,000 bushels cram the elevators and there are 600,000 bushels more on the tracks. The R. R. Co's., demand the release of the cars or a demurrage of $2 to $3 a day, and the Elevator Company demands from the merchants 1½c. per month over present rates for storing the grain in barges. Wool is active and advancing, many lots having been withdrawn for higher prices—Week's sales 1,000,000 pounds.....From Detroit, Mich. comes news that rain is wanted everywhere, but it will be too late to materially benefit corn, potatoes and fruit. Grain markets fluctuating. The production of salt during the last three months has been the heaviest in the history of the State.....In Chicago provisions are stronger on report of a light hog crop and a short corn crop. Grain unsettled but stronger than early in the week.....Peoria, Ill.: welcome rains. Grain receipts good..... Cleveland, Ohio. Large forest fires near-by; weather hot; drought. No. 2 Red Winter wheat $1.40.....Evansville, Ind. Drought continues. Tobacco prospects poor. Grain scarce; prices going up.....Milwaukee Wis. Much needed rains late in the week. Feed going up on account of scorched pastures. A little new wheat coming forward; millers busy. Prices unsettled.

St. Paul, Minn.—A steady downpour for the last three days. Brisk demand for lumber. Wheat trade heavy. Labor scarce.... ....Omaha, Neb.—Abundant rains during the week. Crop prospects brightening. Corn, 50 cents per bushel. Hogs, $6.50 per hundred .....Louisville, Ky.—Weather hot. Scattered rains last week; but some districts without an appreciable shower for 70 days. Provisions buoyant. Grain and flour stationary but firm. Tobacco receipts light; prices firm: total advance in manufactured tobacco 4@6c. Heavy transactions in wool have exhausted stock. Medium unwashed, 27½c.....St. Louis.—Provisions strong and advancing: stock nearly exhausted. From 300 to 500 bales of cotton arriving per day. Speculators prepared to warehouse every bale for an advance. Middling, 11⅜ with an upward tendency. Horses and mules active; supply small. Hot, *hot*, HOT.....Kansas City, Mo.—Demand for cattle brisk. Hogs sell readily for $6.10@ $6.50.....San Francisco, Cal.—Freights heavy. Holders reluctant to sell grain. Trade in agricultural implements brisk. Australian advices say the export to England of frozen meat and fresh fruit promises to become an important business.....Baltimore, Md.— The R. R. Co.'s advance in storage charges is 1⅜c. per bushel for first five days after the 12th, and 2⅜c. for every five days thereafter. Export of grain impossible at current prices. A tumble of 6@7c. per bushel early in the week, but orders from the West and New York have brought up prices again to top figures. Great activity in canned goods; prices advancing rapidly on a short supply of vegetables and fruits. Provisions higher and firmer.....Norfolk, Va.—Drought unbroken; heat excessive; corn probably half to two-thirds of a crop on low grounds of Eastern Virginia and N. C. Cotton arriving freely.....Richmond, Va.—Breadstuffs and meats exceedingly active. Tobacco high and active in all grades. Probably 19,000,000 to 20,000,000 pounds will be manufactured here instead of 16,000,000 pounds in 1880. No rain; great water famine.....Wilmington, N. C.—Rain much needed: hot. All grain crops as well as cotton suffering from drought. Corn scarce and wanted. Provisions bring full prices.....Charleston, S. C.—A sharp advance in price of cotton during the week; prospect for a late Fall and good picking season. All cotton in market promptly taken; four British steamers with capacity of 20,000 bales waiting for cargoes .....Savannah, Ga.—Cotton coming in rapidly; labor in great demand.....Atlanta, Ga.—Dry and hot: nothing encouraging to report of cotton crop.....New Orleans, La.—Drought of a month just broken up by a heavy shower with prospect of more. Too late to help corn and cotton; but if enough, will assist sugar. Labor strike still continues. Rice crop mostly harvested—altogether satisfactory. Good white corn $1 per bushel. Provisions active and high..... Little Rock, Ark.—Hot; no rain. Reports of crops, poor. All cotton is open; picking progressing; labor scarce.....Nashville, Tenn.—Wheat light receipts; millers take all Corn in demand. Light rains here and there —enough to lay the dust. Drought will bring down corn, cotton and tobacco to half crops.

SOME 30,000 cattle were carried over the Pennsylvania Railroad during the late heated term in the new cattle cars, and not one of them, it is said, died during transportation... .....A telegram from Chicago on Sept. 6, says that in view of the enormous flour shipments to the seaboard from Minneapolis, Minn., freight rates are being cut exceedingly low from Chicago to this city, flour being transported for 16c. per barrel.....A squirrel plague is reported to be destroying a great deal of cotton in the uplands of Arkansas. The pests are starving, and pick the unripe cotton to get the seeds.....One of the latest inventions is the manufacture of lumber from straw. A recent experiment showed it capable of the highest polish, waterproof, and it held a nail as well as a piece of oak..... Vermont has suffered a loss, an irreparable loss, in the sale, to an Illinois breeder, of the largest herd of pure-bred Bates Short-horn cattle on this continent and, perhaps, on the globe. Col. Le Grand B. Cannon early last month completed the sale of his entire herd to Mr. Rigdon Huston, of Blandinwell, Ill., already widely known as one of the most successful breeders of Short-horns in that State. This fresh acquisition will give him a commanding position among the breeders of Short-horns on this side of the water and an enviable distinction wherever the famous Bates blood is known—and where is it not? The following is a list of the animals sold:—Sixth Duchess of Hillhurst and c. calf, Seventh Duchess of Hillhurst and bull calf, Eighth Duchess of Hillhurst, Duchess of Overlake, Twenty-second Duke of Airdrie, Kirklevington Duchess XVIII., and bull calf; Kirklevington Rose, Kirklevington Rose, II.; Kirklevington Le Grand, III.; Marchioness of Barrington, II., and bull calf; Marjory Barrington, Ursuline, III., and bull calf; Una, Lady Hilpa, Oxford Loo, Azalea II., Azalea III., Rose (of Sharon) V., May Rose IV., May Rose of Shelburn, Cordelia XVIII. and b. c., Lord Winchester III., Lord Winchester IV., Earl of Burlington, (Wild Eyes,) Moss Rose IX. and c. c., Jacqueline, Jessemine II., Moss Rose IX. and b. c., Constance of Lyndale VI., Constance of Lyndale, IX., Constantia III., Constantia IV. Lady Bell Bates and b. c., Louan of Shelburn and c. c. With them were sold the cows: Grace III., Marian II. and b. c., Edith II., Sophronia II., Lady Shelburn, Louisa and b. c., making a total of 50 animals.....Our Norfolk, Va., advices are that the peanut crop is not as promising as last reported. Some localities in which it was thought there would be a two-thirds crop will not average one-half, and it is believed to be too late for rain to be of much benefit now..... The phylloxera is doing great injury to the vineyards of Sicily.....The dry spells that have become historic were in the summer of 1630, 24 days; 1635, 41 days; 1637, 75 days; 1662, 80 days; 1663, 45 days; 1668, 81 days; 1694. 92 days; 1704, 40 days; 1715, 46 days; 1718, 61 days; 1730, 92 days; 1731, 72 days; 1749, 123 days; 1772, 80 days; 1791, 82 days; 1812, 28 days; 1856, 26 days; 1871, 42 days; 1876, 26 days.....Greece has a fine currant crop—a very momentous matter to her.....

Says one of our humorous Dailies: The ordinary country house in Arkansas is a log cabin; in Kansas, a dugout in the prairie; and in Nebraska, a sod house, built of square pieces of sod." How?.....While small proprietors are to be the salvation of Ireland, in Bavaria 3,739 farms were sold last year because the small proprietors could not keep their heads above water.....Scotch farmers are said to be very discontented, and no wonder, for the weather is bleak and cold, the wheat a thin crop, oats are under avegage, turnips a failure, and barley scarcely up to average.....So hard is it to get good tenants now in England that Lord Lytton lately let for ten years his home farm, 220 acres, four-fifths arable, for $1,400. The tenant, a Scotchman, receives house, outbuildings, and fences in good order, and when they need repair the landlord is to furnish material. During the last three years of the lease the landlord is to pay for half the artificial feeding stuffs, and at the end of the lease the tenant is to receive compensation for improvements .....The sheep clip of Michigan is officially put at 10,975,163, from over 2,000,000 sheep, averaging 5½ lbs. apiece.....If all the creameries talked of are put in operation in Iowa, this year, that State will soon rank with Illinois in the dairy business. They are building creameries all over the State and are making an immense amount of butter.....A shipper of cheese in this city has turned round and is selling cheese to the trade for future delivery; last week he sold 1,000 boxes of August cheese in this way.....Russian butter is being imported into England in considerable quantities, handsomely put up in white oak tubs and very much like Canadian butter.....

From Australia we learn, under date of the middle of July, that in South Australia rains were abundant and the weather was favorable to farmers.....In Victoria the weather was severe and cold, causing a slow growth of grass and other crops in the southern district. In the western district a large number of stock had perished from a long drought, and though rains had just fallen, they came too late to do much good: season the most unfavorable for years. Cheering reports of rain and weather from the northern district.....At Cape Colony heavy rains and snow had fallen August 2, and the prospect for the next harvest was considered very favorable.....Morrocco is suffering from insupportable heat.... ....The amount of money which the Peruvian Government has received from the sale of guano is estimated at twenty-four hundred millions of dollars.....The imports into Germany during the six months ended June 30, 1881, have been, from the official returns:—

	Bushels.
Wheat	6,284,000
Rye	9,857,600
Barley	5,186,4 0
Oats	5,580,000
Maize	7,462,000

The exports of the foregoing articles during the same period have been, in the aggregate, 2,800,000 bushels. Still larger exports are expected during the last half of the year..... In Egypt the condition of the Nile gives promise of good crops.

A Protective Duty.

The person subject to derangement of the kidneys or liver has a protective duty to perform in purchasing a package of Kidney-Wort. It invigorates these organs and by its cathartic and diuretic effect, cleanses the whole system of all bad humors.—Herald.

Write to Mrs. Lydia E. Pinkham, No. 233 Western Avenue, Lynn, Mass., for names of ladies that have been restored to perfect health by the use of her Vegetable Compound. It is a positive cure for the most stubborn cases of female weakness.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

No hospital needed for patieuts that use Hop Bitters, as they cure so speedily at home.

BURNETT'S COCOAINE
Has Received Universal Endorsement.

No other preparation possesses such remarkable properties for embellishing and strengthening the hair and rendering it dark and glossy. It cures baldness and eradicates dandruff.

BURNETT'S FLAVORING EXTRACTS are the best.

The Markets.

CROPS AND MARKETS.

OH the pity of it, that high prices of farm products so seldom go along with fine harvests. With present prices and an abundant harvest there would be little need for non-agricultural wiseacres to tell us "how to make farming pay." Prices of wheat have been very fluctuating during the week. News from the European harvests tend to strengthen them. In England the weather has been good enough to permit the ingathering of crops; but the only point that now seems undecided is whether the present harvest is as bad as that of '79 or that of '80. In France the harvest has turned out much poorer than expected, and about as much foreign wheat will be required as last year. Corn here is going up on wide reports of great injury to the crop from drought and other causes. It will doubtless soon reach the figure of 75c per bushel predicted by our Ill., correspondent last week. Here it is 71½c. now and upwards of 74½c. at St. Louis for May delivery. Cotton is steadily but gradually advancing. The closing quotations of uplands in the New York market compared with those of last year at same date are:

	Last Friday.	Last year.
Ordinary	9¼c.	8 16-16c
Good ordinary	10⅜	10 5-16
Low middling	12 3-16	11 3-16
Middling	12¾	11 11-16
Good middling	13⅛	12 1-16
Fair	14¾	13 8-16

Orleans cottons, as usual, are quoted ¼c. higher. Stained cottons leave off, good ordinary, at 10⅜c.; low middling, 12c.; middling, 12½c.

CLOSING PRICES OF FUTURES IN NEW YORK.

	This week.	Last week.	Last week.
September	12.28c.	11.63c.	11.19c.
October	12.06	11.29	10.78
November	12.05	11.24	10.65
December	12.14	11.28	10.66
January	12.30	11.43	10.77
February	12.41	11.56	10.49
March	12.51	11.70	11.03
April	12.64	11.81	11.17
May	12.73	12.90	11.28

The Southern markets have been active, at higher prices, during the week. They are generally firm at the close.

The following are the sales for the week and closing quotations at five leadiug ports, as compared with last year's quotations:

	Week's sales.	To-day	Last year.
Galveston	10,418	11⅜c.	10⅝c.
New Orleans	11,600	11⅝	11⅛
Mobile	3,550	11¼	10¾
Savaunah	12,700	11⅜	10⅞
Charleston	7,000	11⅛	10⅝

According to the meteorological report telegraphed to this city last Friday evening, the weather throughout the Cotton Belt was excessively dry during the preceding week, the total rainfall at 25 stations having averaged only 0.09 of an inch against 1.58 inch for the corresponding week last year, and 0.77 inch for the preceding week. Since then a severe wind and rain storm has swept along the coast as far north as Maryland, and the rain has extended far inland, as we learn by this morning's telegrams. Indeed, from reports coming from various points of the country far apart, it seems that the rainfall has extended over nearly the entire country east of the Rocky Mountains, varying in severity from a light shower to a soaking downpour. Doubtless in some places it will have hurt some crops; but although it is late, it must have been a general blessing.

Tobacco is advancing steadily in view of very unfavorable reports from the tobacco-growing districts of Virginia, North Carolina, and Kentucky, where it is said the crop has been very severely injured by the drought. The effects of this are already felt in the tobacco stores of this city, the New York agents of the various manufacturers having been notified by their principals that the increased price of seed leaf tobacco compels them to charge more for their goods. Accordingly the prices of the various brands of chewing and smoking tobacco and cigarettes have nearly all been raised, and cigar makers say they, too, must increase their prices at an early day. Tobacco growers should see to it that they, also, partake in this advance.

The wool market at Boston, New York, Philadelphia and the other chief centers of the trade has been excited during the week, and unusually large sales have been made at an advance of prices on the close of August. It is difficult, however, to specify the exact advance in the general market, owing to the previous irregularity of prices. It may be said, however, that sales are generally on a basis of 42@43c. per pound for desirable Ohio fleeces and 45@47c. for medium Michigan and Ohio, while the best lots of Michigan combing and delaine fleeces now command 48@50c., against 47@49c. about 10 days ago. Manufacturers are buying freely to satisfy present needs, without stocking up for future requirements. There is also a pretty strong speculative feeling that prices must go still higher, and accordingly many Western consignors have ordered their goods to be temporarily withdrawn from sale, in expectation of better figures hereafter.

SPECIAL FROM THE CHIEF CENTERS.

Until Saturday, Sept. 10.

CINCINNATI.—Wheat steady; No. 2 Red Winter, $1.42. CORN firm at 68c. for No. 2 mixed. OATS strong at 43¼c. for No. 2 mixed. RYE firm; No. 2 at $1.14. BARLEY dull and nominal; No. 2 Fall, $1.10. PORK firm at $20.50@21. LARD firmer at $11.90. BULK-MEATS quiet; Shoulders, 9⅜c.; Clear Rib, 12c.; Clear Sides, 12½c. HOGS quiet; common and light, $4.90@6.70; packing and butcher's $6.25@7.

CHICAGO, WHEAT active and firm. No. 2, Red Winter, $1.31½; No. 2 Chicago Springs, $1.24a1.25⅝, cash; $1.28. October; $1.31¾, November; $1.33⅜, December; $1.24, all the year; No. 3 do., $1.16; Rejected, 80a90c. CORN active, firm, at 63c.. cash; 64¾a64⅝c., October; 66a66½c., November; 63c., all the year; Rejected, 59¾c. OATS strong at 38¾a39c., cash. FLAX-SEED higher at $1.35a1.36, delivered. PORK steady, with a fair demand, at $19. 25a19,50, cash; LARD fairly active and a shade higher at $12,12½, cash; BUTTER, Creamery, 28a30c., for choice; ordinary, 22a25c.; fair to choice dairy, 17a26c.; fresh made ladle, packed, 13a17c; packing stock, 12a13c; grease, 6a8c. CHEESE, fair to prime full creams, 8a11½c. do., part skimmed cheddars, 7a10c; do, flats, 7a10c; sour and off flavor, 3-a5c. POTATOES, Early Rose, 70c. per bush. on train, and $2a3,50 per barrel from store. APPLES range from 75c. to $1.50 per barrel for common to choice. HAY—No. 1 timothy at $13.75a14.75; No. 2 do. $12.50a13; mixed do. $11.00a12.00; upland prairie, $11.00a14.00; No. 1 prairie, $8.00a8.50; No. 2 do., $6.00a7.00. HOGS—market steady; mixed packing, $6a6.-50; light, $6.45a6.85; choice heavy, $6.70a7.15; culls and grassers, $4.a6.20. CATTLE—exports, $6.10a6.40; common to fair shipping, $4.25a5.-20; good to choice do., $5.40a6; native butchers' active and firm at $2.40a4.25; stockers and feeders, $2.60a4; dairy calves, $9a14 per head; rangers steady, with a fair demand; Texans, $2.65a4.25, mainly at $3.20a37.0; half-breeds and Americans, $3.00a4.40. SHEEP—choice in good demand; common to choice, $3.35a4.50.

ST. LOUIS, MO.—Wheat opened lower, advanced, and closed strong; No. 2 Red Fall, $1.-41¼, cash; $1 40⅝, October; $1 48¾, November; $1 50½, December; No. 3 do., $1 32⅛; No. 4 do., $1 24. CORN opened lower, but advanced to 62½c., cash and September; 64½c., October; 67⅝c., November; 69c., December; 64½c., May. OATS slow at 45c., cash; 44c., October; 44⅞c., November; 46c., December; 50c., May. POTATOES—Near-by growth at 75c. to 95c. and Northern 90c. to $1. BUTTER—Creamery selections at 28@30c., fair 7@8c., off stock at best Dairy price: Dairy—selections 28c., choice 25@27c., medium to prime 20c. to 21c.; common to fair 14 to 16c.; store-packed or country in pails at 12 1-2c. to 18c.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 10, 1881.

BEANS AND PEAS.—Old beans have nearly run out of, quotable quantities, and the market is strong and rather excited for new; in fact, there is hardly a supply sufficient for current wants of exporters and the home trade.

New marrows, $2.90; do. mediums, $2.80; pea, $2.90; old white kidney, $2.40@2.60; do. prime red kidneys, $2; other, 1.70@1.85. Green peas, $1.45@1.50 for Wisconsin. New Southern B. E. next week.

Receipts of beans for the week 3,124 bush.
Exports do. 584 bbls.

BEESWAX.—Market dull at 22@23c. for good Western to prime Southern yellow.

BUTTER.—Supplies have been very moderate, and with apparent increased wants prices have worked up sharply on the buyer. All fine fresh State goods will make our new figures readily; the best goods showing an advance of fully 3c. ₱ ₯. The market has not reached the point expected by holders; there are many lots limited to 35c. and at one time it appeared as if there would be still stronger instructions given. One or two good counties intimate that there has been no very noted suffering from drought, but a "short-pasture" cry comes from points enough to render a high butter season this year unquestioned.

Creamery, finest tubs, 32@33c.; good to prime, 30@32c.; poor quality, 24@26c.; sweet cream, 27@30c.; creamery firkins, 27@28c.; State dairy do. 24@27c.; do. half tubs, choice, 30c.; do. fair to prime, 26@29c.; Welsh tubs, 25@29c.; poor State, 24@25c.; Western imitation creamery, 20@25c.; dairy, choice, 26c.; other, 17@24c.; factory or ladle-packed June, 19c.; other, 15@18c.; common Western, 12@15c.

Receipts for the week, 27,110 pkgs.
Exports do. 5,288 do.
Cold storage on steamer to G. B., 90s.

CHEESE.—The market had a good run most of the week and prices have worked up to very satisfactory figures. Towards the close, however, unusual hot weather and enlarged receipts caused some depression, and the feeling is tame at the close. There seems to be no pressure to sell fine State factory; in fact some fine late Augusts are held at a shade above quoted extreme.

State factory, fine colored, 12¼@12½c.; fine white, 12¾@12¾c.; good to prime, 11¾@12c.; fair to good, 10½@11½c.; poor to fair, 9½@10½c.; Wisconsin factory, good to prime, 11¾@12c.; fair to good, 10¾@11¼c.; Ohio factory, cheddar, fine, 11@11¾c.; fair to prime, 10@11c.; factory, flat, fine, mild, 12c.; good to prime, 10¾@11c.; fair to good, 10@10¾c.; poor, 8½@9¾c.; Creamery, partly skimmed, 4@5c.; fully skimmed, 3@4c.; full-skimmed factory, 3@4c.

Receipts for the week, 77,904 bxs.
Exports do. 47,397 do.
Liverpool cable, 62s.
Steam to Liverpool, 22s. 6d.@30s.

COTTON.—The history of the cotton trade has never before pointed to such an excited week as the past. Speculative orders have come from all points. News from the South is adverse for the crop. Sales have been very large, closing with an advance of ¾@⅞c.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	10 1-16	Middling	12⅛

The averages of Wednesday's forward deliveries as officially reported on the bulletin were as follows: September, 12.10c.; October, 11.97c.; November, 11.94c.; December, 12.03c.; January, 12.23c.; February, 12.35c.; March, 12.49c.; April, 12.57c.; May, 12.62c.; June, 12.73c.

Receipts for week, 7,967 bales.
Exports do 7,923 do

DRIED FRUITS.—Evaporated apples are firm. For sun-dried the ranges are a little variable while stocks are forming, but we notice no weakness in prime or good stock. Peaches and small fruits hold full former figures.

Apples, evaporated 1880 rings, choice, 12c.; prime, 11@11½c.; fair to good, 10¼@11c.; N. C. 1881, sliced, fancy, 9@10c.; choice, 8@9c.; Southern, in bbls. 6¾@7c.; do. 1880, in bags, 6¾@7c.; fine cut, choice, 6½c.; quarters, choice, 6¾@6¾c.; State, small lots, 6c.; Ohio and Mich. choice, 6@6½c.; Western, fair to good, 5¼@5¾c. Peaches, evaporated, peeled, 35c.; unpeeled, 20c.; N.C. peeled, 1881, choice, 25c.; do. 1880, 21@23c.; peeled, good, 18@20c.; Ga. peeled, 1881, choice, 22@23c.; peeled, 1880, 17@20c.; unpeeled halves, Tenn. 7½@8c.; quarters, do. 7¼@7¾c. Plums, State, 17@18c. Blackberries, 13½@14c. Cherries, Southern, dry, 21@22c. Raspberries, 29c. Huckleberries, 13c.

EGGS.—Receipts for the week, 6,786 bbls.; do. last week, 8,478 do. The weather has been adverse to the sale of eggs. A number of Western pkgs arrived in poor condition and buyers at once became suspicious. There is a better demand at the close, as the supply is light and there does not seem to be any wholesale damage showing in general quality.

Near points, ₱ doz. 22½@22c.; State and Penn. 21@21½c.; Canadian, 20½c.; Western, fresh, 20½c.; other useful grades, 18½@19½c.

FLOUR.—Supplies are coming forward with more freedom and buyers' wants are not so urgent. Prices are strong, but for a large business holders might shade a trifle. Compared with last week prices are off, except for the high grades that hold local attention.

No. 2, $4.35@5; State and Western, superfine, $5.30@5.60; city mills, extra, $7@7.35; Spring wheat, extra, $6@6.30; Spring XX and XXX, $6.40@7.50; patents, $7.25@9; Ohio round hoop shipping, $6.15@6.60; trade brands $6.75@7.25; St. Louis extra, $6.40@6.65; do. double extra, $6.75@7.15; do. family, $7@7.50; Southern extra shipping, $6.50@6.85; do. XX and family, $7@7.75. Rye flour, superfine, $5.90@6.40. Corn-meal, Brandywine, $3.80@3.90; do. Western, $3.25@3.75.

Receipts of flour for the week, 85,912 bbls.; corn-meal 2,175 do.
Exports of flour for the week, 60,737 bbls.; corn-meal 3,750 do.

FRESH FRUITS.—Exports of apples for week, 937 bbls. Good apples are firm; but common river and over-ripe lots are more or less at buyers' option. Pears continue abundant and cheap. Wagon venders are peddling fine pears about the streets of New York. The top for Bartletts is $3. Sickle pears dull. Peaches are abundant for the season and short crop, and for the past two days have been quoted comparatively cheap. Grades begin to run common. Plums scarce and firm. Grapes are in large supply and lower. Melons in good demand. Peanuts firmly held at higher prices.

Apples, Golden Sweet, Western New York, ₱ bbl., 70c.@$1; Gravensteins, $2@2.25; Codling, $1.50@1.75; 30 oz., $1.50@2; Malden Blush, $1.75@2.25; Fall Pippin, $1.50@2; poor to fair, 75c.@$1.25. Pears, Bartlett, Jersey, ₱ bbl., $1.50@2.50; up river, $2@3; Western New York, ₱ keg, $1@1.50; Sour Bell, ₱ bbl., $1@1.50; Flemish Beauty up river, $1@1.50; Seckel, choice, $3@3.50; fair to good, $2@3.50@4; Cooking, $1@1.50. Peaches, Jersey and up river extra, ₱ basket, $1.25; prime, 90c.@$1; culls, 40@60c.; Md. and Del. ₱ crate, 50c.@$1.25. Plums, German Prune, State, ₱ 30 ₯ bskt, $2.50; Quackenbush, State, ₱ ½ bush bskt, $1.25@1.50; Reine Claude, ₱ bbl., $7@8; Golden Drop, $5@5; Blue Gage and Boston Gage, $1@4.50; Damson, $1@5; common $2.50@3. Grapes, Del., State, case of 18 3₯ bxs, $1@1.50; bskts, ₱ ₯, 8c.; Concord, State, in bskt, 4c.; Jersey case of 24 2₯ bxs. $1.75@2; up river, loose, ₱ ₯, 3@4c.; Hartford, Jersey, loose, 2½@3c.; up river, 2@3c.; Ives, Jersey, case of 24 2₯ bxs, $1.50@1.75. Huckleberries ₱ box, $1@1.25. Watermelons, Maryland selected, ₱ 100, $30@35; seconds, $10@16; Jersey, Black Spanish, $15@18; Culls, $6@10. Nutmeg Melons, Hackensack choice, ₱ bbl., $2.50@3.50; Key port, choice, $1.50@2; culls, 50c.@$1. Peanuts, Va., hand-picked, ₱ ₯, 7½c.; fancy, 7c.; extra prime, 6¾c.; good to prime, 6¾c.@6½c.; shelled, screened, 5c.@5½c.; shelled, unscreened, 5@5½c; pecan nuts, ₱ ₯ 8@10c.

GRAIN.—The entire market is working under a strong speculative agitation. Operators make the most of the drought influence and the falling off in exports for an important period. Compared with the corresponding eight weeks of last year to date, the decrease in this way is 22,750,000 bush.; of that quantity 17,000,000 is wheat. The export interest seems checked by the strong rule of quotations from week to week, but sellers seem to feel confident that they hold the knotted end of the line. Rye easier. A large exportation of oats is a note for the week.

Wheat, Spring, $1.23@1.38; Spring No. 2, $1,36@1.37; red Winter No. 2, $1.46; red Winter, $1.25@1.48; white Western and State, $1.32@1.42. Rye, $1@1.05. Oats, white No. 1, 51c.; No. 2, 49@49½c.; No. 3, 48c.; mixed, No. 1, 42c.; No. 2, 41@41½c.; No. 3, 39@40c. Corn, Western mixed, 62@72c.; No. 2, 70¼@71½c.; yellow 70@73c.; white, 68@72c.

Receipts for the week, wheat, 1,382,032 bush.; corn, 864,800 do.; oats, 272,700 do.; rye, 21,300 do.; malt, 47,450 do.; rice, 316 pkgs

Exports for the week, wheat, 1,204,800 bush.; corn, 960,828 do.; oats, 75,004 do. rice 1,003 pkgs.

HAY AND STRAW.—Receipts of hay have been decidedly lighter this week and stock in the sheds has been greatly reduced by a steady demand. Prices have favored sellers, and show some advance. Prospects for the remainder of the month appear favorable. Straw easier.

Prime Timothy hay, ₱ 100 ₯s., 90c.; medium Timothy, 85@90c.; shipping grades, 50@55c.; clover mixed, 55@60c.; clover, 45@50c.; long rye straw, 60@65c.; short, 30@35c.; but and wheat, 35@40c.

Exports for week, 1,424 bales.

HOPS.—The market ruling is very quiet. The stock of yearling hops is very small, and of only fair quality. Brewers buy only small lots for immediate use, awaiting the arrival of the new crop. A few small lots of new of the main crop arrive, but have had no sales to establish a reliable quotation. Some transactions are reported in the interior at 18@21c. The lots so far arriving are of irregular quality; some show very careful picking and handling, but are thought to lack strength by being picked too early. Estimates of yield in this State are still various, but generally smaller than heretofore.

Crop of 1881, Early Seedlings, 20@25c.; 1880, choice, 19@20c.; 1880, good to prime, 15@18c.; 1880, fair to good, 13@15c.; 1880, poor to fair, 10@13c.; 1880, eastern, 10@18c.; 1879, fair to prime, 12@14c.; 1878, 5@8c.

Receipts for week, 367 bales.
Exports for the week, 9 do.

MILK.—There has been a scarcity and a high average is quoted: $2.39½ ₱ can of 40 qts. at commission platforms; range, $1.25@3.

POULTRY AND GAME.—Supplies of dressed have run light and prices have improved for all items. Some of the State stock arrived in poor order owing to the hot weather, but none has turned out too bad to sell.

Turkeys, Phila. prime, 16@18c.; State and Western dry-picked, 15@17c.; scalded, 14@16c. Chickens, Phila. 18@20c.; Bucks Co. 16@18c.; Jersey, 16@17c.; State, 14@16c.; Western, 14@15c. Fowls, Phila. dry-picked, 15@16c.; Bucks Co. 15c.; Jersey, dry-picked, prime, 14@15c.; do. scalded, 14@14½c.; State and Western, dry picked, prime, 14@15c.; scalded, prime, 13@14c.; inferior, 12@12½c. Ducks, Spring, Phila. ₱ ₯, 16@18c.; Jersey and Bucks Co. 15@17c.; State, 14@16c.; mixed State, 12@14c.; old, fair to good, 10@13c. Squabs, white, ₱ doz. $1.75@2; dark, $1.25@1.50.

Live poultry is scarce and prices are strong and in sellers' favor. Coops have lost in count badly during the hot week. One shipment of 24 coops showed a loss of 139 fowls that were smothered.

Chickens, Jersey, Spring, ₱ ₯, 15@16c.; State and Penn. 14@15c.; Western, 12½@14c.; Southern, 12@14c. Fowls, Jersey, State and Penn. 13@14c.; Western, 13c.; Southern, 12@13c. Roosters, old, 5@7c. Turkeys, Jersey and Penn. 14c.; Western, 13@14c. Ducks, Jersey, extra-large, ₱ pair, 90c.@$1; Jersey, New York and Penn. 35@75c.; Western, 40@50c.; Southern, 40@45c. Geese, Jersey, $1.62@1.87; N. Y. and Penn. $1.25@1.50; Western mixed and Southern, $1@1.25. Pigeons, large, strong birds, 25c.; young, 20c.

Good game has a fair demand, but most of the game reaches here in an unsalable condition.

Grouse, prime, 80c.@$1; partridges, $1.25@1.50; woodcock, State, 80@90c.; do. Western, 75@85c.; English snipe, ₱ doz. $1.25@1.50; plover, $1.25@1.50.

PROVISIONS.—The market for hog products holds its strong upward tendency and a steady, large export call supports the frequent advances which have occurred during the week. Stocks light; operators make a strong point of a short corn crop.

Pork, extra prime, ₱ bbl. $15.25@15.50; Western mess, new, $19.25@19.50. Lard, steam Western, ₱ 100 ₯s. $12.35; prime city, $12.27½. Hams, smoked city, ₱ ₯, 13½@14c.; pickled Western and city, 12½@13c. Shoulders, smoked city, 8¾@9c.; pickled, 8@8½c. Rib bellies, pickled, 10½@11½c. Bacon, long clear and Western, 10¾c. Beef, Western mess, ₱ bbl. $12@13; packet, $13@14; India mess, ₱ tce. $22@24. Beef hams, ₱ bbl. $22@22.50.

Receipts for the week—Beef, bbls. and tcs. 577; pork, bbls. 537; cut meats pkgs 13,561; lard, do. 84 8.

Exports for the week—Beef, bbls. and tcs. 2,160; pork bbls. 2,170; cut-meats, ₯s. 2,125,179; lard do. 4,575,462.

RICE.—Demand fair. We quote:—

Carolina and Louisiana common to fair at 4¾@5⅜c.; good to prime at 5¾@6½c.; choice at 6¾@7¼c.

SALT.—Quotations are: Ashton's at $2.50; Higgins's at $2.40; Holmes's extra sifted, $2.40; Deakin's at $1.25; Evans's at $1.30; Washington's at $1.25; Marshall's at $1.25; Virden's at $1.30; Worthington's at $1.20; Mediterranean at 25c.

SEEDS.—Clover is ruling quiet and firm. Timothy in active home trade demand at a further advance. Rough flax-seed not salable above $1.45; some lots held at $1.50.

Clover, Western, 1880, job lots from store, 10½@11c.; do. in car lots on track, is 9¾@10c. 1879, do. 8@9¼c. Timothy, job lots in store, $2.90@3.25. Flax-seed, American rough, $1.45.

SUGAR.—Refined has advanced; quotations are for: Cut loaf, 10¾c.; crushed, 10¾c.; powdered, 10¾c.; granulated, 10c.; mould A, 9¾c.; confectioners' A, 9¾c.; standard A, 9⅝; off A, 9⅝@9¾c.; white extra C, 8⅞@9c.; yellow extra C, 8¼@8⅝c.; C, 7⅝@8¼c.; yellows, 7@7¼c.

VEGETABLES.—Exports of potatoes, 1,743 bbls. Potatoes show a strong advance. Near point producers have a firm position, as few lots arrive from the West. Shipping demand brisk. Prime sweets are firm.

Early Rose, L. I., ₱ bbl., $2.50@2.75; Jersey, $2.25@2.50; up river, $2.25@2.50; Snowflake, up-river, $2.25@2.50; Burbank, up-river, $2.25@2.50; Peerless, Jersey, $2@2.25; sweet potatoes, Va. yellow, $2.75@3.25; Del. river, $3.25@3.50.

Garden truck is fairly active. Onions are turning in buyers' favor.

Sweet corn, Jersey, prime ₱ 100, 90c.@$1; inferior, 50@60c.; wax beans, L. I., ₱ bag, $1.50@2; string beans, L. I., $1.50@1.75; Lima beans, potato, $2.50@2.75; flat, $2@2.25; cucumbers, L. I., ₱ 100, $1@1.25; pickles, ₱ 1,000, $2@2.50; egg plant, L. I., ₱ bbl., $1@1.50; tomatoes, L. I., ₱ bush., 20@25; Squash Marrow, ₱ bbl., $1.75@2; cabbage ₱ 100, $3@7 beets, L. I., ₱ bbl., $1.25@1.50; white onions, $2@2.50; yellow, prime, $2@2.25; red, eastern, $1.87@2; Chester, $1.50@1.75; carrots, $1.25@1.50; turnips, Russia, $1.25@1.50; okra, ₱ 100, 15c.

WOOL.—An active turn to the market; all points mention a good business and Boston reports the largest trade of the season. The demand is mainly for fine and good grades of wool.

Ohio, Penn. and West Va. XXX and picklock, 43@45c.; X to XX, 41@42c.; No. 2 to No. 1, 38@45c.; coarse, 33@36c.; combing, 42@46c. State and Western X to XX, 38@40c.; No. 2 to No. 1, 36@41c.; coarse, 32@34c.; combing, 38@45c.; combing unwashed, 28@34c. Virginia, West Va. and Md. unwashed, medium, 27@29c. Tub-washed, fair to choice, 35@44c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Sept. 10, 1881.

BEEVES.—Receipts for the week, 13,722 head; do. last week, 11,200 do. The week has been a severe one on ments of all kinds. Trade has fallen off for consumption during the very hot days, and butchers' wants have run small. The few reported transactions were at 8@8¼c. for Texans and Colorados; 8@10¾c. for common to fair native steers, and 10¼@10¾c. to dress 56@57 ₯. for good to prime. Light State bulls, grassers, changed hands at 3c. live weight.

SHEEP AND LAMBS.—Receipts for the week, 37,615 head; do last week, 31,329 do. The demand is moderate; butchers have not made daily visits. Poor to fair sheep, 3¾@5c.; good to prime, 5¼@5¾c. Poor to medium lambs, 4@5¼c.; fair to prime, 5¾@6½c.

MILCH COWS.—Trade continues fair at a range of $30@60, with moderate receipts.

SWINE.—Receipts for the week, 23,869 head; do. last week, 18,734 do. State corn hogs, 6¼@6¾c.; Western, 6¾@6¾c.; grass hogs slow at 8½c. N. J. pork, 8¼@8¾c.; city-dressed, corn, 8¼@8¾c.; do grass, 7½c.

VEAL CALVES.—Supplies have run light and prices ruled strong, State doing as well as N. J.

Live calves, prime N. J., 8@8½c.; do. State, 8@8½c.; poor to good, 6@7¾c.; Mount Hollys, 7@8½c.; buttermilks, 4½@5c.; grassers, 3½@4c.

For the Young.

FARMING FOR BOYS AND GIRLS. No. 34.

HENRY STEWART.

Corn.

CORN is our greatest feeding crop; and if wheat is *the* human food crop of the world, corn is *the* food of our domestic animals. Its importance may be seen when we consider that corn is the chief food of our working horses and mules: our beef, mutton, pork and poultry are fattened upon it; it is the chief supply of the dairymen who produce butter from it, and the owner of a flock of hens supplies them with corn in exchange for eggs. Nearly all our starch is made from corn, and a vast quantity of other products is used in different arts and manufactures. Besides this, the fodder is of very great value. The quantity grown every year would fill more than 3,000,000 freight cars, which would reach from New York completely around the world and lap over nearly enough to reach from New York to Chicago. The carrying of this vast quantity of corn to the various markets where it is sold employs thousands of men, and the cars, engines, elevators and ships needed to transport and store it employ still more thousands of workmen and mechanics in their construction. So that if it were not for corn a large part of the work and industry of the world must stop. We see in all this what a great service the farmer performs in finding work for the world, as well as in producing food for it.

Corn is a species of grass. There is but one species of it, but there are many varieties. There are white, yellow, black, blue, red and brown kinds, and some are striped and variegated with several of these colors. The plant has a strong, stiff stem, broad, long leaves, a spike of flowers on the top of the stalk, which we call the tassel, and another or others on the stem at the joints, which we call the ear. Its manner of growth and flowering is remarkable and is sometimes irregular. The young plant appears as a straight, smooth spire, in which the leaves are tightly rolled up, presenting only a sharp point as it emerges from the soil. Then the leaf unrolls, and by-and-by other leaves unroll until the plant shoots up and grows from four to sixteen or even twenty feet in hight. The stem has several joints; from each of these a broad leaf starts, clasping the stem at its base. These leaves are arranged alternately upon opposite sides of the stem, and each is closely wrapped around the stem to the joint below it, where it becomes a a part of the substance of the stalk, the stalk gradually increasing in thickness from the top leaf to the bottom. From the lowest joint a number of strong root-like stems often proceed and enter the ground; these are called aerial roots. The true roots are spreading and reach several feet from the stem, both sidewise and in depth.

The center of the stem, within the layers formed by the leaf substance, consists of a stalk formed of pith and a stout covering. This is the flower stalk which bears the tassel. The tassel, or panicle, consists of a number of spikes arranged in pairs, each pair spreading on opposite sides of the stalk and in a crosswise direction from that of the next pair. The spike contains a number of spikelets, each consisting of two small greenish flowers. The flowers consists of three chaffy scales, and out of the center of these come three slender threads or stamens. At the end of each stamen are the anthers, which appear as small scales, and these contain the pollen or fertilizing material, which appears as fine dust when the ripe tassel is shaken. The tassel thus bears only staminate or male flowers, as a rule, but sometimes the pistillate or female flowers appear on the branches of the tassel and produce grain. The pith of the central stem and flower stalk is very sweet and contains a good deal of sugar. The fertile or pistillate flowers are borne upon a stem which proceeds from a joint. Frequently there are several of these fertile flower stems, which we call cobs. Sometimes the cobs branch near the base and produce two or more smaller cobs. Sometimes a stalk has several cobs, each proceeding from a joint; this is common in what is known as "pop corn."

The flowers are arranged upon the cob in several rows, but these are always in pairs, usually 8, 12, 16, 24 or 32 in number. Eight and 12 rowed corn is most common. Each flower consists of six chaffy scales: in the center is the ovary, from which proceeds a long, silken thread, which is the filament and stigma of the flower. The ovary, filament and stigma together are the pistil and the flower containing the pistil is termed pistillate, and is the productive part of the plant, from which the seed is produced. It is common to call pistillate flowers, female flowers, because there is a similar distinction in these flowers corresponding to sex in animals. One silk proceeds from each flower and there are sev-hundred of them upon each cob. The cob or flower stalk, the flowers and the long delicate silks or filaments with the stigmas at the end, are protected by a number of leaves folded around them, which are called the husk. The silk projects from the point of the ear and as the pollen is shaken from the tassel above by the wind, or as it gently falls from it by its own weight it drops upon the ends of the silk (the stigmas) and fertilizes them and enables the minute germ in the ovary at the other end of the silk to form a grain. For every grain there must be a "silk" and this silk must be fertilized by pollen from a flower of the tassel. Every silk has a germ attached to it, but if the silk receives no pollen it withers and the germ dies. As soon as the germ is fertilized the silk dries and is of no more service.

Sometimes, tassel or staminate flowers are found on the ear mixed with pistillate flowers. This is one of those strange occurrences which, however, appear to be very simple when the cause is understood; and the student of botany, remembering that flowers and fruit, and even the thorns of the prickly plants, are only changed leaves, will be no longer surprised that the changes may even change their manner of changing, and may cause variations in the manner of growth.

Corn is a very productive plant. A seed produces a stalk and the stalk may bear an ear having 500 grains, or several ears having in all more than a thousand grains. It is very easily grown and if it is well cultivated and given space for light and air it will produce a fair crop upon soil too poor to produce any other kind of grain. But when grown upon good soil it will produce a very abundant crop. Some crops recently grown by boys who competed for a prize both in New York and Vermont produced over a hundred bushels of shelled corn per acre. This shows what a clever, industrious boy can do when he tries to do his best.

NOTES.

ALTHOUGH the Horticultural Club has been organized some time, and its members are numerous, yet the original plans have not been fully carried out, for various reasons. However, we now propose, with the aid of the cousins, to organize a series of "Horticultural Club Discussions," somewhat as follows: A topic for discussion will be given this week which I wish *all* the cousins, if possible, to consider, and upon which they are to gain the best information they can, and then, by postal or letter, send me their views upon the subject as soon as possible. The best of these will be published under the heading, "Horticultural Club Discussions," in the second or third issues following the announcement of the topic. Thus a "meeting" of the club will be held every two or three weeks. It will be seen that the success of these discussions will depend almost wholly upon the interest which the members of the Club take in them, and as it is for their benefit we shall expect them to respond heartily. It is our desire to make this a lively, practical department, and with the co-operation of the members of the Club, it can be done.

We shall also, as often as once a year, publish the names of all the active members of the Club, and shall drop from the list all who do not correspond for this department, and who seem to lack interest in it. During the Fall and Winter, we shall call upon certain of our best writers for brief essays on topics to be suggested, to alternate with our "Discussions," stories, etc.

The topic for the first meeting of the Club, to be reported in the RURAL for Oct. 1, if possible, will be "Grapes—their culture, best varieties, etc." Now, let's see how interesting we can make our first meeting!

I WISH to acknowledge, with thanks, the receipt of a little box of fruit from M. C., St. Paul, Minn.

WE are always glad to receive letters from the older "Cousins," and hope they will write us whenever they have anything of interest, to the young people, to communicate.

HEREAFTER the names of those who wish to join the Horticultural Club will be published each week. We do this so that they may know that their applications have been received. UNCLE MARK.

New Members of the Club for the Week Ending September 10.

H. R. Roberts, Atlantic, Iowa; Maggie Belle Lash, West Newton, Pa.; Sarah E. Shisler, Williams Ville, N. Y.; Jennie W. Pherrin, Springville, Iowa; Mary E. Bohn, Dallas Center, Iowa; Minnie Schlepegrell, Wellville, Va.

A timely use of Hop Bitters will keep a whole family in robust health a year with but little cost.—*Adv.*

Sabbath Reading.

HELP OF GOD.

"That which I see not, teach Thou me." Job xxxiv 32.

It is Elihu who said these words, not as his own prayer, but as one which he recommends as "meet to be said unto God."

It is a humble prayer, for it will only be used by those who feel their own ignorance.

We are not humble by nature. Very soon we outgrow the teachable spirit which is seen in very little children; yet this is one main feature of childhood which our Lord says must belong to all who would "enter the kingdom of heaven".

But the true believer, who has been taught by the Holy Spirit that is, in himself, poor and miserable, and blind and naked," will ever be ready to acknowledge that he stands in continual need of teaching.

God has set limits to what man is to know and understand in his present state. "We know in part," says St. Paul, and the same truth was asserted by Moses when he taught that there are "secret things" which "belong to the Lord our God," as well as "things revealed to us."

It is good to use this short prayer often. We know not day by day what need we may have of special teaching.

When once we have passed early youth, and have ceased to have parents or guardians who think for us, and tell us what to do, we are all likely to come, now and then, to some turning-point in our life, some occasion on which we pause and consider which of two, or it may be more, courses of action, we shall follow.

We see, perhaps, advantages and disadvantages in each line of conduct, and they appear so evenly balanced that we feel a painful degree of indecision as to what is really best and wisest for us to do.

Perhaps we consult with friends, and this is a good thing to do. "In the multitude of counsellors there is safety," as we find it said twice in the book of Proverbs. But it is possible that we may not get from our friends any very clear or positive direction. Or we feel, on further reflection, that we have not been able to state our case so clearly as to enable them to see all the reasons for advising either one course or another which even our own judgment has preceived.

And now we turn to God. We lay the case before him. We try to tell Him all our thoughts and perplexities, but even as we pray, we feel there are half-formed wishes or fears that we can hardly put into words. We feel so ignorant of what the future may prove. We think we could decide better, if we only just knew what the consequences of one step might be. And yet we must take that one step immediately, and risk all the consequences.

Now is the very time for this prayer. God "sees the end from the beginning." He knows exactly what is the very best and wisest thing for us to do, and He has graciously said that if any one lack wisdom, he may come and ask for it, and he shall certainly receive it.

At such a time of perplexity then use this prayer, and let it be a guide to you, a "model prayer;" which shall help you to come in a right spirit to the throne of grace.

But there is another occasion on which this prayer may be the very one we need. It is when we come to special difficulties in reading the Word of God.

No one denies that there are difficulties. The best and holiest men have granted that it is so. Does not even one Apostle say of the writings of another that there are in them "some things hard to be understood?"

How often, too, as we read some sayings of our own blessed Lord and Master, do we feel that we are like the earthly disciples, who "understood not the sayings that He spake unto them."

Doubtless it may be that to the end of our days we shall have to leave some passages unexplained. Is it surprising that a book inspired by God should not be absolutely and always intelligible to the finite understanding of man? But one of the very first lessons to learn in reading the word of God, is to ask for the holy spirit's teaching while we read. No one who does not do this can imagine what a different book the Bible becomes, when the Lord opens the understanding to "understand the Scriptures." What better words can we use, every time we read the Word of God, than those of the short prayer we are considering?

Reader, whatever point there may be that perplexes you, and makes you unable to reconcile different parts of the Word of God with one another, or, it may be, to reconcile some parts with your own preconceived notions, kneel down and pray from your heart, "Lord, that which I see not, teach Thou me, for Jesus Christ's sake, and you will assuredly receive, sooner or later, the teaching you ask, and be ready to exclaim with Elihu; "Who teacheth like Him?"

Wind Mills.

MIX'S BANNER WIND MILL
Best made. Runs with less wind and has more power than any other. Never blows down. Ten ft. Mill $55. Warranted for 5 years. Full description free. N. P. Mix, Avenue, O.

CHALLENGE WIND MILLS
Victorious at all fairs. Over 7,000 in actual use in every State and Territory of the U. S. It is a section wheel—has been made by the present Co. for ten years; in all that time not one has blown down without tower breaking—a record no other mill can show. We leave it to the public to determine their merits. Mills sent on 30 days' trial. Best Feed Mills, Corn Shellers, &c., &c. Catalogue free.
CHALLENGE MILL CO., Batavia, Ill.

ENTERPRISE WIND MILL.
Known and sold throughout the world and acknowledged The Best. Simple Durable, Strong. Few Joints. Frictionless Turn Table. Multiplying Ball Governor. All sizes for Rail Road, City and Farm purposes. Every Mill Warranted.

PERSONALS.

Longfellow has in his time declined three embassies.

Senator-elect Lapham, of New York, is a cousin of Miss Susan B. Anthony.

General Fitzhugh Lee will marshal three thousand Virginia militiamen at Yorktown.

Minister Christiancy has returned from Peru and is in this city. He is a good-looking old man, very gray, but of a hearty manner.

Highwaymen in California tried to wreck a train the other day, for the purpose of capturing millionaire Fair, whom they expected to hold as a hostage until heavy ransom should be paid.

The will of the widow of ex-President Millard, Fillmore who died the other day, leaves public bequests to the amount of $50,000, among which is one of $20,000 to the University of Rochester.

Farmer Dalrymple, the great wheat-raiser of the Northwest, is a slender, quiet-looking man, of clerical appearance. He is more accustomed to the book and pen than the plow, and his fingers are as soft and white as those of a girl.

Charles O'Conor's residence and fire-proof library, two distinct buildings, which he is erecting at Nantucket, will cost about $35,000. They are on a cliff on the north shore of the island. He intends to leave them to some Roman Catholic institution as a sanitarium.

James G. Fargo, who has been elected president of the American Express Company, is a brother of the former president, the late William G. Fargo. The new head of the company has been in the express business since 1844 and he is reported to be a man of large wealth.

Knocking down a man who said he hoped President Garfield would die and getting fined for it has proved a very profitable investment for Capt. Charles A. Cook of Brownville, O. Nearly $800 has been collected by subscriptions for him. Of this $175 has been invested in a testimonial gold watch, and he will receive the rest in cash and bonds. He has been proposed for several offices but declines to run.

[Detroit Free Press.]

Mrs. C. Whipple, 371 Croghan Street, presents these facts: For six years I had suffered beyond all expression with Sciatic Rheumatism and tried every known remedy, but all to no purpose. At last I saw in the Free Press an advertisement of the St. Jacobs Oil, tried it and am well. I can walk without limping and sleep free from any pain.—*Adv.*

Implements and Machinery.

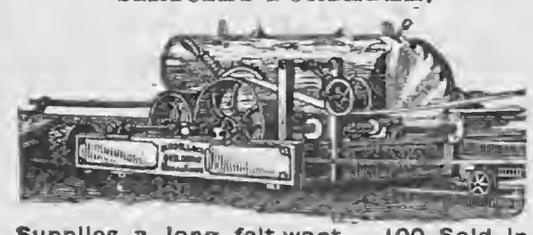
The Sedgwick Steel Wire Fence
Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every repect, and far better than barbed wire. We ask for it a fair trial, knowing it will wear itself into favor. The SEDGWICK GATES, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the BEST and CHEAPEST ALL IRON Automatic or SELF-OPENING GATE. Ask hardware dealers, or for price list and particulars address
Sedgwick Bros., Richmond, Ind

COMMON SENSE ENGINE.
Simple, durable, of the best workmanship and material. Solid Wrought Iron Boilers. Engine complete on board cars at Springfield, O., at following prices: 3 horse power, $275; 5-horse power, $300; 7-horse power, $375; 10-horse power, $500. These engines fully guaranteed in every respect. Address Common Sense Engine Co., Springfield, Ohio.

THE MASSILLON PONY MILL
STRICTLY PORTABLE.



Supplies a long felt want. 100 Sold in Ninety Days.
Every owner of a Farm Engine located in moderately timbered country can find profitable employment the year round by purchasing one of these Mills.
Every owner of a timbered lot is interested in having one of these Mills in his neighborhood. No more hauling logs to mill. All the waste saved.

USE ONLY THIS THE FIRST AND THE BEST

Humorous.

A CELEBRATED lawyer once said that the three most troublesome clients he ever had were a young lady who wanted to be married, a married woman who wanted a divorce, and an old maid who didn't know what she wanted.

TEXAS people do not exert themselves on epitaphs, no matter how much display they make at funerals. Down on the Rio Grande, a plain board at the head of a mound tells the public that "13 of them Mexican Greasers are planted here."

HE came into the office and said. "You see, my brothers are shoemakers, and they mended my shoes. Now, why am I like Joseph of the biblical history?" We gave it up. "Why, because I was soled by my brothers." The inquest on him will be held to-day.—Puck.

A LITTLE two-year old girl came one morning into a half darkened room where her baby cousin was kicking up his heels on the rug in front of the fire. On the hearth near by lay a pile of cigar ashes dropped there by one of the family the night before. The little girl saw the baby and the ashes and rushed out crying in tones of terror, "Oh, auntie, come quick. The sawdust is all coming out of your baby's legs!"

A BIG, fat colored woman went to the Galveston Chief of Police, and told him that her step son had run away, and she wanted to know where he was. "It bodders me to know why he left. He had everything he needed to make him cumfable. I done all I could for him," she observed. "Has he any marks by which he may be recognized?" "Well, I don't reckon all de marks I made on him with a bed slat, while de old man was holdin' him, has faded out yit."—*Texas Siftings.*

[Albany, (N. Y.) Daily Press and Knickerbocker.]

Abandoned.

We perceive by one of our Massachusetts exchanges that Dr. Lorenzo Waite, of Westfield, an eminent physician of Berkshire Co., strongly indorses St. Jacobs Oil. With it he cured a case of Sciatica that resisted all regular professional treatment, and that had in fact been abandoned as incurable.—*Adv.*

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME

Vol. XL. No. 1652.} NEW YORK, SEPT. 24, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Farm Topics.

THE NITROGEN SUPPLY.

J. B. LAWES, L. L. D., F. R. S.

At Rothamsted, in the middle of May of the present year, I planted a few seeds of corn, which I had received from a gentleman living in Baltimore, upon that portion of my land which has grown a permanent wheat crop for 40 years without the application of any manure.

In the adjoining field, which is under experiment with permanent barley, potatoes, and leguminous crops, I planted about 100 seeds, placing three together, and allowing them the space of a square yard or more from which to collect their food.

The plot of ground upon which they were planted is outside the portion of the field under experiment; it certainly has received no dung for the last 30 years, and may be described as a piece of waste land which has been plowed with the rest of the field, but has not been cropped, though vegetation has sprung up principally in the form of thistles or annual weeds.

My object in sowing the corn was a very imple one. I wished to ascertain whether the color of the plant under different foods corresponded with that of the various cereal crops which we have under experiment.

At the period at which I am writing—August 22—the corn upon the unmanured wheat land is only one foot high; there is no leaf that is one inch in width, and the color is yellow, or a yellowish-green.

In the adjoining field some of the plants are between four and five feet high, while the leaves are three-and-a-quarter inches wide, and of a very dark rich green; other plants, although growing and luxuriant, are much paler in color. In this field I have used mineral manures alone, and mineral manures with nitrates.

In the same field, with the corn and close to it, there are 15 different sorts of leguminous crops growing; they are all manured with (1) various mineral manures alone, and (2) with the same minerals, and in addition nitrates or salts of ammonia.

Here we have no changes in the color of the plants due to the influence of the various manures; there are none of those varieties of tint from a yellowish-green to a greenish-blue, which in the evening appears almost black, that we find in some of our graminaceous crops under experiment. A practiced eye might detect in some cases a brighter and more healthy green, but that is all.

So far as the corn is concerned, by a comparison of the produce grown on the permanently unmanured land, and that grown on the field supplied with minerals and nitrates or salts of ammonia, it is evident that the plant has profited largely by the application of the manures. At the same time, while I think that corn, in common with the other cereal crops, is dependent upon a liberal supply of nitric acid *in the soil*, I must not in saying this be supposed to advocate its application artificially. I quite agree with Mr. Stewart in thinking that mineral manures alone should be used, or mineral manures with the addition of a small quantity of nitrogen, so long as they enabled the farmer to grow 100 bushels of corn or even a much smaller crop than that per acre.

The only difference between Mr. Stewart and myself is this: I think that it is to the soil rather than to the atmosphere that we must look for the supply of nitrogen; while Mr. Stewart's view is that the poverty of his soil does not admit of so large a supply being yielded.

This question can only be set at rest by the continuous growth of corn under mineral manures alone; and even under such circumstances many years might elapse before satisfactory conclusions could be drawn. I have more than once, when writing upon American agriculture, pointed out the immense advantage which United States farmers possess over ourselves and others who live in climates not suitable for the growth of cereal crops.

It is quite true that the United States farmer is fully aware of this advantage, and does not require to have it pointed out by me; but, at the same time, I may possibly, by the aid of science, help him to understand why it is that he can grow a much larger crop of corn, than he can of any of the other grain crops; and, further, when his land is more or less exhausted, why mineral manures will be more effectual when applied to the corn than when applied to other grain crops.

At Rothamsted we are now engaged in writing upon the subject of rain water and drainage, and in the Journal of our Royal Agricultural Society, now being printed, will be found an account of the composition of rain water passing through an uncropped soil.

The article is well worth the study of those who wish to know what is taking place in our soils; but I will here refer only to one result, by way of illustrating my present subject.

The month of July, 1880, was exceedingly wet, and for the season of the year, an unusual amount of water passed through our drain gauge soils. At the beginning of August the soils had lost the greater part of the nitric acid.

August was a very dry month and hardly any water passed through the soil; September was excessively wet, nearly six inches of rain having fallen, of which four inches passed through the soil.

What was the result?

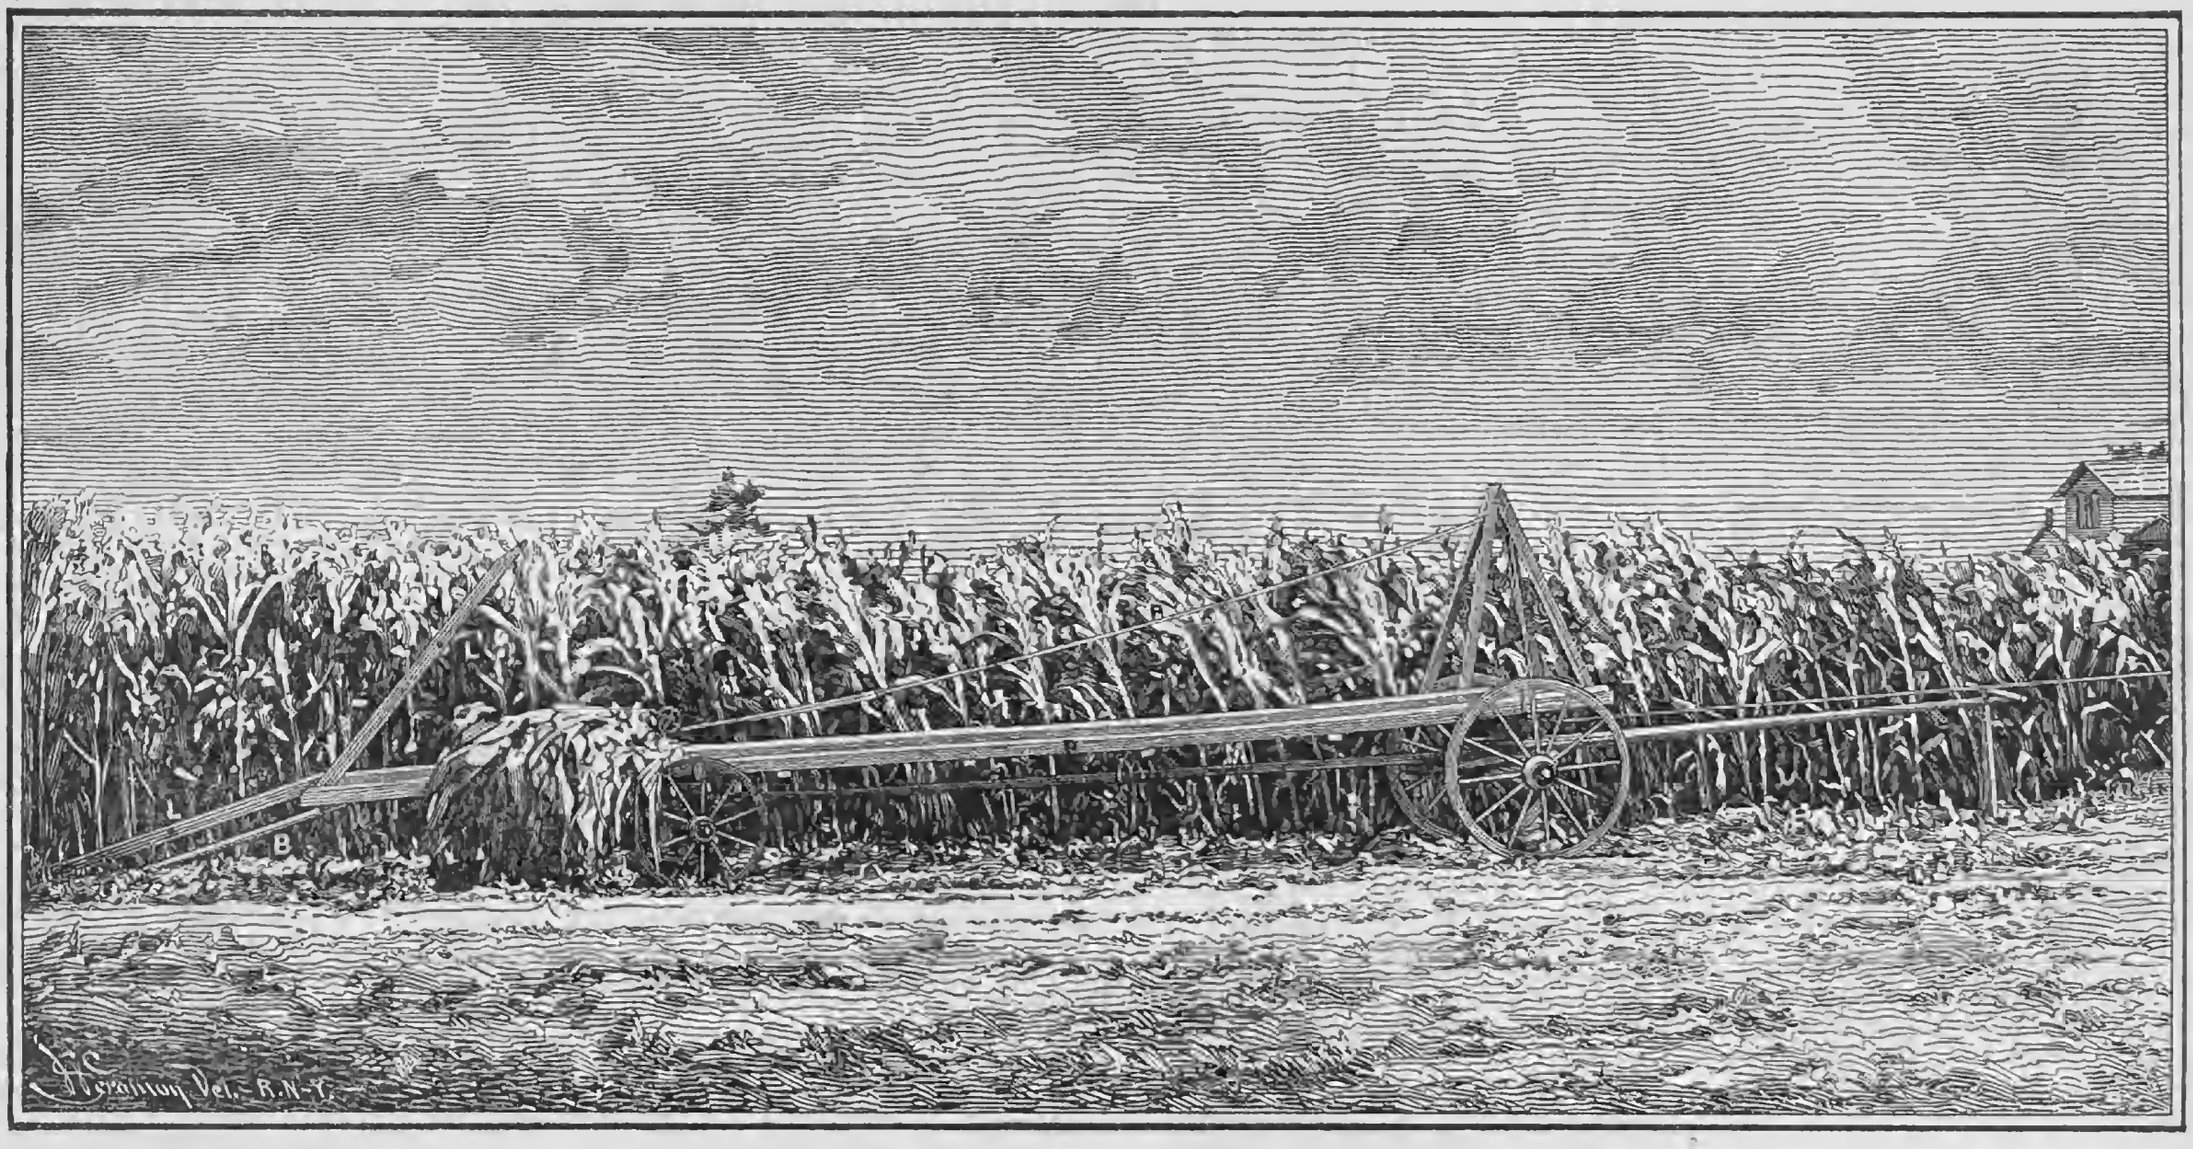
We find, by analysis of the drainage waters, that the nitrogen as nitric acid washed out of the soil, if calculated upon an area of an acre, would amount to 16 pounds, which is equal to the amount contained in 100 pounds of nitrate of soda, and not much less than what would be contained in 2,000 pounds of ripe corn as it stands in the field!

This formation of nitric acid has taken place upon a plot of the ordinary arable soil of my farm, which has been kept free from vegetation, and has been washed by the rainfall for the last 10 years.

If such a formation of nitric acid takes place in the Rothamsted soil during one short month, what must be the amount liberated in the United States soils in the interval between the time when the wheat is ripe, and the time when the corn ceases to collect food from the soil.

In these facts we have surely a very simple explanation of the reason why more benefit is derived from the application of mineral manures to corn than to other grain crops.

I abstain from entering upon any question with regard to the *source* of the nitrogen which we find in our drainage water, and will merely point out that it could not have been obtained from the atmosphere by plants, as the soil was kept free from vegetation.



ENSILAGE WAGON.—Fig. 465.

SILOS AND ENSILAGE WAGONS.

PROFESSOR I. P. ROBERTS.

The Silo.—After visiting Whitman & Burrel's silo last Winter, I decided to build a small one for experimental purposes. It is located in an angle just outside the barn, the base-

ment walls of the latter being used to form the silo walls on two sides, ten feet high; the other ten feet were formed by laying a four-inch wall of brick against the double boarding of the barn, and driving 30d nails half way in, and 16 inches apart between every fifth and sixth course. The outside and cross walls are built of large and small field stones, and Fayetteville water-lime laid in movable boxes. The outside walls are 24 inches thick; the cross wall, 18 inches. The divisions of the silo are respectively 11 by 16 feet and 10 by 16 feet and 19 feet in depth. Over all is a wooden structure nine feet high, with flat roof covered with tin. Both compartments are arranged to get pressure by a rod anchored about five feet below the bottom of the silo. Their capacity, by filling five feet above the stone wall (it will settle about one foot in five), will be not far from 150 tons. Fig. 467 shows how the anchor is secured. I, anchor plate, one-and-a-half foot long, six inches broad and one-and-a-quarter inch thick; R, R, pieces of railroad iron 10 inches long; C, railroad iron pieces three feet long; O, rod one-and-a-quarter inch square in three sections. The top section has a thread cut for five feet; nut five inches square and three deep. Wrench handle 30 inches long. In case the silo is filled only half-full the middle section of the rod can be taken out.

ENSILAGE WAGON.—As it appeared to me to be far too much labor to get pressure by handling so many stones four times a year, (we shall fill semi-annually), the same objection was found to loading and unloading 300 tons of green material annually. The accompanying cut Fig. 465—from a photograph—and the description below will, I think, make my invention (*not patented*) intelligible to all.

P, two poles 25 feet nine inches long, of chestnut, pine, elm or basswood; diameter of front end seven-and-a-half inches, of rear end, five-and-a-half inches. Use the front part of a common wagon and place it two feet from the front end of the poles. Use trucks in the rear, wheel two-and-a-half feet in diameter, with bolster three-and-three-fourths feet long and place seven feet three inches from the rear end of the poles. L. L. loading skids of hard wood, six feet long, three-and-a-half by one-and-a-half inch, attached to rear of poles by slot and pin. One is shown down, as in loading; one up, as in going to the silo. B. board one-and-a-quarter inch by ten inches, five-and-a-half feet long, loosely bolted on to last cross-piece between skids for a walk-way for the loader, and also to prevent the fodder from falling between the skids. Seven hard-wood cross-pieces one-and-a-half by three inches, bolted to the under-side of the poles, form the foundation for the matched floor which may be six inches narrower than the distance between the poles; this leaves an opening on either side for any dirt to pass through. The poles or sills should be placed as wide apart as possible, especially at the rear end (four feet), where they will not interfere in turning, in order that a wide channel or chute may be formed by the sills and floor, preventing the bundles from swerving to either side. S. a standard to support the pulley, is made, of four pieces, two by two-and-a-half inches, five feet three inches long. Two, two-inch auger holes are bored, with the proper slant, in each pole—one, one foot from the end; the other, two feet ten inches from it. The four upper ends are bolted together, and a pulley (five inches in diameter) is placed well up in the apex and secured by a bolt. A pulley is also tied to the rear end of the tongue at the point where the rod fastens it to the hounds; it is kept upright in position with a wire passed through the top end and secured to each pole.

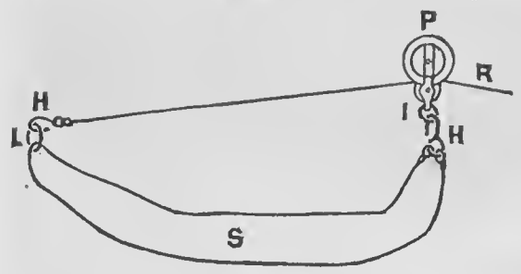


FIG. 466.

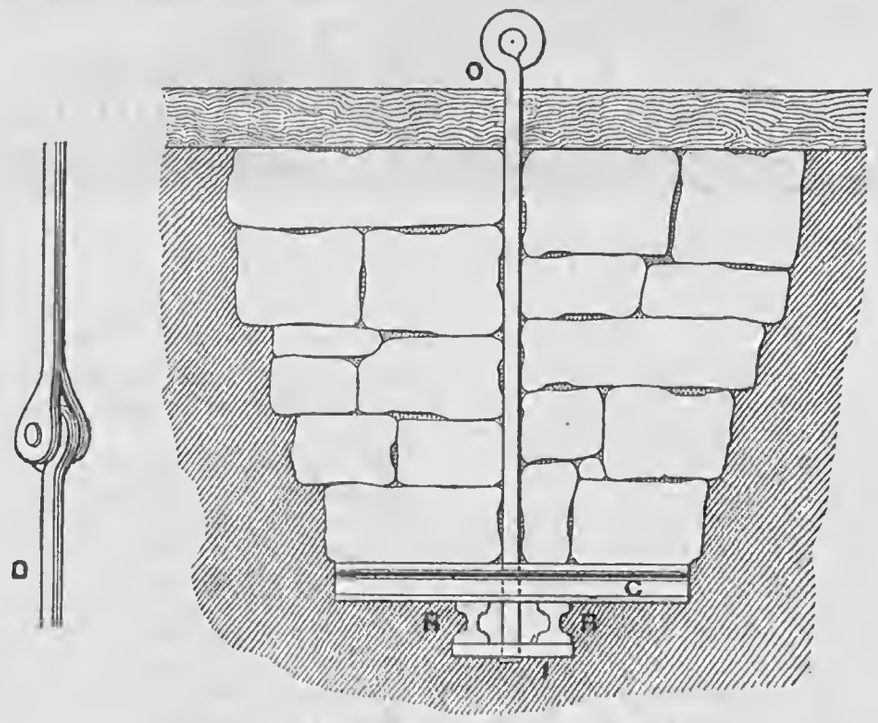
SLING ROPES.—Fig. 466. For one horse they should be about 17 feet long and five-eighths of an inch in diameter; the two ends splice into a ring-hook H. H.. In the middle a link, L two-and-a-quarter inches long and five-eighths of an inch broad inside, is secured by tying the doubled rope together with a cord. This rack was tested by loading and unloading a bundle of white Southern corn about eight feet high and as yet showing no signs of tassels. A 17-foot sling rope (doubled) easily encircled the bundle of 630 pounds, and one horse had no difficulty in drawing it on to the wagon. The corn is drilled three feet four inches apart and it took two rows 100 feet long to produce the bundle. It occupied, when loaded, a horizontal space of three feet eight inches. This would give six bundles to a load or 3,780 pounds, which is far more than one team should handle on soft ground, so I propose to diminish the number, and increase the size of the bundles, and use two horses to draw them on to the rack, and also use the same team to help the wheel horses to draw the load to the silo where they will be needed to do the unloading. The number of sling ropes should be at least twice as great as the number of bundles it is proposed to put on one load, as the cutters will want half the slings to lay on the ground to place the corn on for the next load. After the bundle is cut the hook-ring to which the two ends of the sling rope are made fast, is hooked into the link in the middle of the sling rope in order that the teams and wagon in passing over it may not disturb it.



MODE OF SECURING ANCHOR.—FIG. 467.

R. is a pulling rope, three-quarters of an inch in diameter and about 54 feet long. This is spliced into the ring hook (H). The ring-hook must be small enough to pass through pulley (P). The pulling rope is passed under the first pulley at the rear of the tongue, over the one in the standard (S) and to the ground at the rear end of the wagon, and then passed through another five-inch pulley in the hands of the loader.

The ring-hook, H. H, is hooked into the eye (I) of the pulley (P). The ring-hook (H) is hooked into the link L. The head team is started, the sling (S) shirrs and rolls the bundle half over into the skids. The loader follows the bundle, and when it is in position unhooks the pulling rope from the sling rope, and also the pulley; hooks the sling-hook of the sling into the link of the sling; starts the wheel horses and passes to the rear of the wagon and ground, carrying with him the end of the pulling rope and pulley (P).

I have experimented enough to *know* that two men can load a bundle each minute, including driving between bundles, be it 500 or 800 pounds. I think I can unload two bundles per minute or two at a time, as they will draw down the incline easily.

Cornell University, Ithaca, N. Y.

SCREW POWER PRESSURE FOR ENSILAGE.

WE recently examined a new silo-barn which has just been erected by Mr. George T. Powell, Agricultural Editor of the Chatham Courier, Chatham, N. Y., and for durability and convenience we have yet to find its equal. The barn and silo walls are built of concrete, in the proportion of 12 barrels of sand to one each of lime and cement, with the necessary filling of small stones. Along the entire length of the barn (75 feet) is a silo, divided into three compartments, answering essentially to three distinct silos. The first of these is 19½x16x20 feet, with a capacity of about 150 tons; the second is 32x16x20 feet, with a capacity of 200 tons, and the third has the same dimensions as the first.

A novel feature of the silos, and the one in which we were most interested, was the comparatively new method of obtaining the requisite pressure for the ensilage, by which Mr. Powell proposes to do away with the laborious and inconvenient method of weighting with stones or earth. In the top of each of the side walls of the end silos, half way between the cross walls, a screw an inch and a-half in diameter and projecting four feet above the walls, is firmly imbedded. After the fodder is put in, a sufficient number of planks to cover it will be laid crosswise of the silo, and upon the ends of these planks two timbers will be laid to receive the pressure from a single cross-timber, through the ends of which the screws pass. In case the fodder does not extend above the walls of the silo so as to allow the cross-timber to be acted on directly by the screw-nut, blocking will be used. In each of the side walls of the middle silo two screws will be set equidistant from the cross walls and from each other. A wrench with long leverage will be used in turning down the nuts. Mr. Powell thinks that extremely heavy pressure is not necessary, and has no doubt that a sufficient pressure can be given the ensilage in this way. This phase of the experiment will be watched with interest.

One of the end silos is already partially filled with 25 tons of clover, upon which, as an experiment, several loads of rye in the sheaf have been placed to act as a weight and to economize space; but it is a matter of doubt if the ensilage comes out in good condition. The other end silo will be filled with millet, while 15 acres of drilled Chester County Mammoth Corn will be ensilaged in the middle apartment.

The ensilage will be taken from the silos through doors opening from below directly into the cattle and sheep stables, and be conveyed around to the different stalls by a hand-car or barrow. It will be fed mostly to sheep (about 400 in number), which is another phase of the ensilage-fodder question which farmers will be interested in, inasmuch as cattle have heretofore been chiefly the subjects of experiment with the new fodder. Mr. Powell is a progressive farmer and does not propose to confine himself to old methods simply because they are old, but, on the other hand, unlike many neighboring farmers, he feels assured of success in his new undertaking, and in the "new fodder dispensation" in general.

THE SORGHUM SUGAR INDUSTRY IN KANSAS.

I have been spending the last six weeks in traveling over a good share of this State. I have visited the county seats of 42 counties, and being deeply interested in the welfare of the Amber Sugar-cane industry, I have endeavored to learn what was being done in that line. I find that so far this season about half a million dollars have been expended for buildings, machinery, etc, to work up the crop of Kansas. On account of the very dry weather and the chinch bugs, the cane in some sections has been entirely destroyed, and much injured all over the State. Still in the counties of Pawnee, Barton, Ellsworth, Rice and Reno, there is some very good cane, as well as some very large mills, the two largest being at Stirling and Ellsworth. I am under many obligations to the Editor of the Ellsworth Reporter, who is also secretary of the Ellsworth Sugar Works, for his kindness in showing me the works and the surrounding country. The cost of the mill and buildings when completed, will be about $75,000. The cane crusher was built by Geo. L. Squier and Bro., of Buffalo, N. Y. It is the largest ever sent into the Western States. The three rollers and spur-wheel alone weigh 38,000 pounds. This season they have only 1200 acres of cane to work; but next year they expect to have the produce of 6,000 acres, the company intending to put in a large share of it themselves. The mill at Sterling is nearly as large, and this season will crush something over 1,800 acres of cane, I was told. There are also at Sterling, Raymond, Roxbury, Prosper, and Bavaria, large steam mills running for molasses. It is pleasing to hear the farmers tell of the great improvements that have been made in the machinery for working up the cane, and how much superior the product is now to the old-style bitter sorghum of the past 50 years. I visited Mr. E. M. Rugg, and found he had just completed setting up his ninth outfit this season. He says the cane is unusually rich owing to the dry weather. I found on testing it in different places, that it would show from 8 to 11 Baumé. Mr. Rugg's first trial batch for sugar in 24 hours swung off five pounds of sugar to the gallon. This I consider unusually good. From August 19 to 22 there was a general rain throughout the State, which helped the cane and corn crops very much. In my opinion there is no State in the Union better adapted to growing the small sugar-canes than Kansas, and the farmers say that if the mills now up prove that they can make sugar in paying quantities, there will be more Sorghum planted next season than of any other crop. In a few days, I shall go East and look through the mills and prospects of other Western States; and then see what I can do in New York.

Topeka, Kansas. C. J. REYNOLDS.

Field Crops.

TOBACCO GROWING NOTES.

THERE is little doubt but that tobacco can dry too fast during the process of curing. For this reason a tobacco-barn should be constructed so that it can be tightly closed in times of dry weather, when too rapid drying—which invariably causes undesirable colors in the leaf when cured—is likely to occur. During dry, windy weather it is also advisable to keep the ground or floor of the curing barn wet by sprinkling it with water, which slightly moistens the air in the building and causes the tobacco to cure less rapidly.

THE danger of damage to tobacco, while curing, from "pole sweat," is only during times of damp or muggy weather, accompanied with extreme heat. At such times the tobacco should be given thorough ventilation by opening the ventilating doors, which should be constructed in the sides of the building, beneath the sills, and upon the roof or in the gable ends. Careful watch should be kept of the tobacco hanging on the lower tiers, and if damage to the crop is likely to occur with all possible natural ventilation given, some artificial means should be adopted. Small, smouldering fires kept up in various parts of the curing room, will cause upward currents in the air and secure the necessary ventilation to prevent "pole sweat."

AMONG the first things which the farmer who contemplates tobacco raising should attend to is a place to raise the young plants or the plant-bed. The beds should be prepared during the Summer or Fall previous to the Spring when they are needed for use. A few loads of rich muck or garden soil, free from stones and rubbish, drawn to some warm exposure and inclosed in a frame, will constitute the present necessary requirements. A liberal coating of well-rotted stable manure should be spread over the bed, to remain there until the following Spring, by which time it will have imparted its strength to the soil of the bed. For early plants a covering of glass is necessary to exclude cold storms and winds in early spring-time.

THE importance of securing early an abundant supply of good plants has been fully realized during the past dry Summer. Reports from the various tobacco-growing sections of the country are unanimously in favor of early tobacco. The best crops are grown by farmers who raise enough plants for themselves and for their neighbors also, reserving, of course, the earliest and best for their own use. Thus they secure enough of the best and strongest of the plants to meet their own requirements early in the season, which gives the plants time to become well established in the soil before the approach of the dry term, which has this season proved destructive to late tobacco generally. There have been a few instances during my tobacco-growing experience when late tobacco has been better than early, owing to storms of wind or hail, which injured the early and larger growths most; yet I think I am safe in saying that in eight seasons out of ten the outcome of early-planted tobacco has been most satisfactory to both grower and purchaser. G. A. G., JR.

Chemung Co., N. Y.

GROWING WHEAT ON CORN LAND.

WALDO F. BROWN.

I LIVE in one of the largest hog-producing counties of Ohio, and corn is, of course, extensively grown, and as we are too far south for oats to do well, and much of our upland is unsuited to bear barley—and thanks to the growth of temperance sentiments many of our farmers will not grow the latter crop—it comes to pass that every year there is a large breadth of wheat sown on corn land. Probably the majority of the poorest wheat grown in the county, and that which cuts down our average yield in the statistical reports, is from that sown *among* corn. I emphasize the word *among*, for I make a broad distinction between sowing on corn land, and sowing *in* the corn. What I mean by this is, that I always cut up the corn before sowing the wheat, even though I must wait till October to put in the crop; but it is rarely that the corn crop is so late as to make this necessary.

The way the light crops of wheat are grown on corn land is usually this: The corn fields are allowed to become grassy, and when it is

time to sow the wheat, it is either sown broadcast and scratched in with cultivators, or else it is drilled in between the rows with a one-horse drill. In an hour's ride I could show hundreds of acres that were put in in this way last Fall among the standing corn, and which cut from ten down to three bushels to the acre. I am satisfied that the reduced yield from wheat sown in standing corn, is not altogether due to the fact that the land cannot be put in as good condition as that from which the corn has been removed. Whether it is the shade which makes the wheat grow spindling, or something else that hurts it, I cannot tell, but I have experimented in the matter until I know that the standing corn injures the wheat.

In the Fall of 1879 Mr. L. N. Bonham sowed a field of wheat on rich bottom land, near where I live. One half of it was sown *in* the corn and the other half a little later after the corn was cut up. The part sown in the corn yielded 14 bushels to the acre, and the other half of the field 28 bushels. Mr. B. assured me that the land was put in excellent condition for the entire crop. The next year he grew 38 bushels to the acre on a field where the corn was cut up. My crop of 1879 was all sown on corn land. I had two fields of six and twelve acres respectively, and the yield was 30 bushels to the acre on the smaller, and 22 on the larger field. My crop of 1880 was 30 acres and only four acres of it were corn land, but the yield on those four acres was above the average of the crop, although it was not sown until October 8.

The first thing to be done when you are intending to seed corn land, is to keep it clean; then when you cut up the corn make the shock rows from 16 to 20 rows apart. *Do not break up the land*, but with a good harrow or the cultivator and roller, make the surface fine and mellow and drill in your wheat. This preparation gives just the right kind of a seed-bed, but if the land is plowed and the corn roots turned under, the seed-bed is not compact enough, and the wheat is likely to freeze out. I can usually put in my wheat with less labor on corn land than on stubble or sod. As I have been uniformly successful in growing profitable crops on corn land, and there are many who have made repeated failures, and it is very desirable to seed corn land in order to bring about a proper rotation, I have thought best to give my experience condensed into a nut-shell—it is this: Keep your corn land clean; cut up the corn as early as possible; make a fine, mellow surface, and drill in your wheat, and you may reasonably expect a good average crop.

Butler Co., Ohio.

NOTES FROM THE RURAL FARM.

We have now to report the exact yields of the Fultzo-Clawson and Shumaker Wheats, both of which are offered in our next distribution. The first was drilled in on a plot measuring 150 x 55 feet or, let us say nineteen-one-hundredths or a little less than one-fifth of an acre. The yield was seven bushels or at the rate of a fraction less than 37 bushels to the acre. The Shumaker was drilled in upon a plot measuring 109 x 150 feet, or three-eighths of an acre. The yield was 12 bushels, or at the rate of 32 bushels per acre. The soil is poor—a sandy loam. Five tons of farm-yard manure were spread upon the wheat stubble Sept. 20. The disc harrow was used twice and 200 pounds of pure bone flour were sown. It was then again well harrowed, the seed of both kinds drilled at the rate of one-and-three-fourths bushel per acre on Sept. 23, and the field was finally rolled. It will be seen that the land received no special fitting and but a moderate quantity of manure—that is farm manure at the rate of about 10 loads to the acre and bone at the rate of about 400 pounds to the acre. The Fultzo-Clawson is the heaviest yield we have ever raised upon this farm, unless upon specially prepared plots of smaller size. The grain owing, doubtless, to rainy and cloudy weather during its Spring growth, is not so plump or large as it was last year. We have no doubt whatever that in more favored wheat-growing sections, Mr. Wysor's claim that it yields the largest grain of any early-ripening, hardy wheat in cultivation, will be supported.

CORN IN SEPTEMBER.

As late as it is in September, if a one-horse cultivator can be run through corn by a small boy, there will be an earlier ripening, a last crack at the weeds, and a loosening of the hard-baked crust, which will be repaid by sounder corn for early use or market either. This course is equally valuable for all crops (garden as well as field) which will admit the horse between the rows. Don't let any crop go into winter-quarters with a hard, hide-bound soil. Try a stack of corn fodder built up in alternate layers of fresh new hay and the corn, and let the cows give their opinion of it during the coming Winter, or the calves either; the cows will reply through the milk pail, the calves by their improving condition *while the stack lasts*. Dig potatoes early; cover them in a pile in the field till after the first sharp frost, then take them in.

Go to all the fairs within your reach, note the animals; look around for a change of seed for the better; let the female part of the family inspect the cookery from an economical point of view, and the patchwork from an artistic platform. Give them money enough to spend for all they see worth buying, and so shall your farm and its products for the future be fair to see. A live fair is one to which everybody goes determined to learn something, and to apply the new ideas at home. Now, to wind up with corn, as I began: corn is your mainstay, so put your faculties to work to grow it and house it in the very best manner.

Dodge Co., Neb. S. R. M.

SUCCESS WITH RURAL SEEDS.

I have this year a half acre of Blount Corn from seed of my own raising. The seed proved to be well ripened in 1880; but this poor corn year will perfect but a small proportion of ears. For fodder, however, the Blount is worth one-third more than any other variety I ever tested. It stands eleven feet high. I planted it quite too close for a corn of such immense leafage; and am as a consequence going through and cutting out the weaker stalks. By the time this cutting is finished I can cut the remainder as ripe corn. I consider the Rural has done us an inestimable favor in introducing so generally this corn. I feel confident of ripening it thoroughly in this section except in such exceedingly bad years as the present.

The Rural Branching Sorghum is a curiosity, at least, for it grows faster for being cut down. Its value as fodder I do not feel sure of. But the cow pea the Rural sent me last year I shall not willingly let go. It is the most astonishing grower, and the delight of my sheep. For soiling sheep it is admirable. It ripens perfectly here.

The Ovoid Beet is another real treasure. It is a grand cropper and is harvested with as much ease as Rutabagas. From flower and shrub seeds I have only moderate results and in the flower line nothing first-class. The willow is fine. The White Elephant stands the drought better than the most of my varieties of potatoes; but I am inclined to think the Burbank is so far the people's potato; while for early the Early Rose has not been surpassed. I believe that the Blount Corn will prove as great a revolution in the fodder as in the ear. By carefully selecting the earliest ears to ripen, we shall soon shorten its season ten or fifteen days. E. P. Powell.

Oneida Co., N. Y.

Keeping Irish Potatoes in the South

A querist lately asked how to keep Irish potatoes in the South. We have some now, Sept. 5th, that were dug last March. I don't think we have lost a peck by decay through the whole Summer. In the first place they must be dug as soon as ripe: it will not do to wait for the tops to die, for they do not die down, as they do at the North. Ours were perfectly green and in bloom when the tubers were dug. Our house stands up four feet from the ground and we have kept our potatoes by simply putting them in boxes under the house, and leaving the covers open a little to admit the air.

Bradford Co., Florida. Mrs. I. Sumner

"Golden Grains" Wheat.—Early in the Spring I received a small sample of what purported to be Golden Grains or Palestine Mammoth Wheat; also a circular requesting me to take an agency for it. I concluded to test the wheat before investing. Besides being very badly used up with rust, its growth was very short and it did not head. G. S.

Carrol, Ia.,

[This was precisely our experience with the sample of seed kindly sent to us at our request, by Mr. Haines. Eds.]

Sheep Husbandry.

COTSWOLD-MERINO SHEEP.

The Cotswold, a very old and long-established breed of sheep, has been extensively used for crossing and improving other breeds. It has given stamina and constitution to the highly and closely bred Leicester; it has helped to give size and weight and length of fleece to all the cross-bred Down breeds; one-half of the Shropshire blood is Cotswold; a fourth of the Oxfordshire is the same; the Hampshire owes some of its excellence to it, and as a sire for half-bred mutton sheep from the common native ewes of the United States and Canada, it is unsurpassed by any other race. Of late years it has been used to cross upon the Merino and the cross-bred race has been found to possess remarkably valuable points. In fact, there is no race of sheep with whose blood that of the Cotswold has been mixed, without producing a progeny better than the inferior parent, and in some cases the sire itself has been surpassed.

Perhaps the Cotswold-Merino cross is the best of all. The Merino has an iron constitution, possesses a most valuable fleece and flesh of the sweetest flavor. But its wool is short and fine and useful only for the finer, softer fabrics and the more expensive goods, while its carcass is too light and its lamb, although extremely fat and rich of flesh, is too small for profit. Crossed with the Cotswold, a lamb is produced which at six months weighs more than its dam; and a sheep which ranks with the sire in weight and with the dam in quality of meat, and has a fleece which is worth more for coarse clothing fabrics and shawls than the pure dam's wool, and is equally valuable as that of the sire. Such a sheep is essentially the farmer's sheep; for it is marketable from the age of three months, as a choice fat lamb which brings the top price, up to the age of three years, when it is a ripe wether, reaching a weight, when fully fatted, of 250 pounds. In the mean time its fleece of combing wool—the basis of the worsted and bunting goods, and the extensively used small woolen wares, fringes, braids, and trimmings—is always salable at a fourth more than double or treble X fine wools.

Mr. Joseph Harris, of Rochester, N. Y., was the first breeder to make an extensive business of crossing Cotswolds upon Merinos. The Gerrish Brothers, of Webster, N. H., have also been engaged in this pursuit for some years past. Mr. Harris has been successful in raising some fine sheep and his success has led many others to follow his example. The Gerrish Brothers have also achieved success in the same way. As an example of what they have done, we give the accompanying portrait of one of the cross-bred rams as it appeared when eleven months old. It then weighed 101 pounds and its fleece 11 pounds and five ounces. The Merino parentage is visible in its face and fore-quarters, but its general make-up and its hind-quarters are decidedly like those of its Cotswold grandsire, which was a well-bred Cotswold from Canada. This ram is the produce of a curious crossed crossing, if we may so express it. The sire was the product of a pure Hammond Merino ram and a Cotswold ewe; the dam was from a Hammond ewe nearly pure and a pure Cotswold ram. The sire and dam being each half-bred, the produce of these is half-bred also and the owners of the young ram, being well contented with the result of their experiment, have named it "Golden Mean." Just now when sheep rearing is attracting much attention as a promising pursuit, it is interesting to notice this cross which certainly offers unusual opportunities of success with materials which can be obtained at small cost and with the greatest ease. A flock of well selected grade Merinos which can be procured for three dollars per head and a vigorous young Cotswold ram at $25, will lay the foundation for a flock one of which may easily double the value of the dam before it is four months old.

GOLDEN MEAN.—FROM AN INDISTINCT PHOTOGRAPH.—FIG. 168.

Dairy Husbandry.

THE DAIRY COW.

HENRY STEWART.

Indications of Disease.

Cows are usually healthy and robust. The exceptions are the high-bred and high-fed animals kept by breeders who force their stock by every possible means to undue production. Life and vigor cannot be drawn upon so excessively, and last to the end of the common period of usefulness. The stock of these is something like a fixed quantity from which one may take small or large drafts; the larger these are the sooner will the supply be exhausted; and this is very much the case with high-kept dairy stock. The common dairy cow, moderately fed, never pushed beyond the natural period and capability for milking, lasts for 20 years without an ailment or an accident, except as the result of some carelessness or neglect. On the other hand, the high-bred Jersey cow, valued at thousands of dollars because she responds liberally to a system of forcing and makes a remarkable product of butter from high-feeding, is constantly suffering from garget or threatened with serious disease, and finally dies of milk fever. And yet the Jersey cow, notwithstanding her occasional want of constitution, will always be the favorite family cow and the "butter-machine" of the dairyman. It is therefore necessary that precautions should be used both to avoid accidental disturbances with common cows and to avert threatened dangers from those which are more subject to disorder.

The owner of a cow should know when his animal is doing well and be able to recognize at once the first approach of trouble. A healthy animal exhibits certain unmistakable signs of its condition: the appetite is regular and vigorous, the muzzle is moist and covered with drops of perspiration, the eye is bright and active, the coat is smooth, the horns are moderately warm, the milk is given in full quantity, the respiration is easy, the pulse is regular, and the process of rumination is constant soon after eating. When an animal is ailing the first effect of the disturbance is more or less fever, and this is indicated by the dryness and heat of the muzzle, uneasy or rapid breathing, coldness or excessive heat of the horns, falling-off of the appetite, rise of temperature and increase of the pulse. The frequency of the respiration and of the pulse varies in different animals, but in health the respiration is always easy and the pulse never more than 50 in a minute in adult cows. The pulse may be felt most conveniently on the jaw near the large, flat muscle which closes the jaws. Here the sub-maxillary artery comes from the inside and passes over the edge of the bone and up the side of the face in front of this large muscle. The artery may be felt by placing the first and second fingers of the right hand on the left jaw towards the inner side of the bone, and the thumb on the outside to keep a steady pressure. The brachial artery may be felt on the inner side of the fore-arm, below the shoulder, level with the elbow joint, and in advance of it. A little practice with moderate pressure of the fingers will soon fix the places where these arteries can be found and the pulse examined.

The next usual symptom of disorder is the suspension of rumination, or "loss of cud." This is generally accompanied by roughness of the skin, dullness of the eyes, and apparent lassitude, the cow moping and standing apart with the head down and occasionally grinding the teeth. When these symptoms are noticed, it is time to be on the alert to discover the cause of the trouble and apply an immediate remedy. Usually some circumstance may be recalled, which will account for the disturbance—some over-feeding, some exposure, or neglect, or even some change of feeding, which is often sufficient to disarrange the system and

cause sickness. Neglect of timely precautions may in such cases bring on serious disease of the blood and a general inflammatory condition which will subject the animal to danger of infection by means of germs of disease which are always present in the atmosphere, waiting for a favorable opportunity of becoming sown, in a suitable soil, so to speak, where all the requisite conditions for their immediate growth may be presented. The first approaches of disease are usually silent and inconspicuous. Some little changes may be noted, but these seem so insignificant that they are passed over without any serious thought, and are forgotten. Here is the greatest mistake that is made. It is far easier to prevent mischief than to cure or avert it when it has arrived. The lower animals, with dull nervous systems, patient and uncomplaining, exhibit no signals of distress until the strength fails and disease has taken a strong hold upon them. Too often remedies are then too late, which at the outset might have successfully prevented a serious attack.

When cows are kept under good sanitary regulations, in clean, well-ventilated stables, they rarely suffer from any other disorders than those of the digestive organs, and there are no diseases more easily remedied, or that at the same time, if neglected, more effectually poison the blood and result disastrously, than these, so that immediate measures should be taken to remedy the trouble. These are fortunately very simple. A dose of a pint, or a quart, of linseed oil, or even melted lard, will usually restore the functions of the stomach and remove the difficulty; or 12 to 16 ounces of Epsom salts may be substituted, dissolved in a quart of warm water, and followed by copious draughts of warm linseed gruel or bran slop. Even the common and popular remedy of a salt mackerel freed from bone and crushed in the hands and put down the throat, is a reasonably effective one, because the mackerel contains considerable oil and fat, and the salt excites the stomach, both together having the desired effect.

When these simple remedies with a concurrent change of food and the use of soft, nutritious mashes or gruels, fail to arrest the disorder, a very complete and patient examination should be made, and the peculiar symptoms noticed written down, that they may be more accurately considered. A labored respiration with short, hasty, catching breathings, or heavings of the sides, redness of the eyes, cough or rustling of the breath, indicates disorder of the lungs. Dark, discolored and fetid dung, streaked with blood and mucous; dark-colored, hot urine which smells strongly; arched back, and head stretched out low, are indications of blood disorders or intestinal disturbances, or both, for the latter is a usual effect of the former, and the contrary even happens at times. General weakness, with tumors, swellings, lameness and eruptions on the skin signifies constitutional disorders, such as tuberculosis, and other similar hereditary diseases of the blood, which are not inflammatory in type, but show in their action an effort of nature to throw out the offensive matter. Usually other diseases than these, local in their character, indicate themselves so clearly that it is unnecessary to specify particularly in regard to them. When the most conspicuous symptoms have been noted and written down, reference should then be made to the list of symptoms to be given hereafter, which will greatly help to fix the nature of the disease; and, when that is known, to choose the treatment proper for each special case will not be difficult for any person of common intelligence.

Horticultural.

RURALISMS.

I VERY much incline to the opinion that the practice of letting the old wood remain in raspberries and blackberries till Spring is much too common. The reasons given for it do not seem to me to be altogether well founded. It is said by those who practice it that the old wood affords a good Winter protection for the new. I have not been able to convince myself that this is really so; on the contrary, there is good reason to believe that it makes the new wood more tender, and hence more liable to be winter-killed. Wood that is grown fully exposed to the sun and weather ripens more thoroughly and becomes tougher than wood that is shaded, and is consequently better prepared to endure the rigor of Winter. Besides, we usually have more time to cut out now than we do in the Spring, when it is too commonly the case that, instead of "pushing things," things generally push us. Therefore I conclude that it is wise to begin to cut out the old canes from the raspberries and blackberries immediately after the fruit has been picked, and to continue it till the work is done.

IT may not generally be known that the so-called fancy caladiums (Chantinii, argyrites, etc.) can be easily grown in pans or tubs of water, and it greatly lessens the labor of taking care of them, while it is in accordance with their natural habits. I saw them doing finely in the basin of a fountain at Mr. Brooks's, a trifle shaded. The pots were plunged in the basin, and only the blades of the leaves, with a short length of stem, appeared above the surface of the water. When the pots are placed in pans, the latter should be deep enough to hold an inch or two of water. The caladium is one of the comparatively few plants which may be safely grown with the plants standing in saucers. Water, and an abundance of it, is a necessity with these, and without it they soon lose their freshness and beauty. Even a single wilting, in the early stages of growth, will often mar a plant for the season, and sometimes kill it. Too large a percentage of these charming plants die within a few weeks after being bought, and there is no doubt in my mind that this is simply because beginners (and even some "old hands") are not familiar with the craving of these plants for water. It will be safe, therefore, for beginners to set their pots of caladiums in saucers, and keep the saucers well supplied with water. Where there is a gardener about to water regularly the necessity for this may not exist; still, all plants will do best when their natural wants are freely supplied.

MIGNONETTE and Sweet Alyssum have long been among the most popular of winter-flowering annuals, and deservedly so. There are many amateurs, however, especially among the ladies, who do not seem to know that the seeds of these annuals may be sown at any time during the month of September for Winter flowers. The seed of the Sweet Alyssum may be sown in a shallow box, or pan, or pot, and transplanted as soon as out of the seed leaf. If plants have been grown in the border, seedlings in abundance will be found around them at this season of the year, and may be transplanted into pots. The double and variegated varieties may be grown from cuttings, or the old plants may be cut in close, and then transferred to pots. Tom Thumb is a very dwarf, compact, free-flowering variety, and desirable for winter blooming. Mignonette is difficult to transplant, and the seed should therefore be sown in small pots. The proper way is to put four or five seeds in the middle of each pot, and thin out from two to three plants as soon as they are out of the seed leaf. Repot them as soon as the ball of earth has become filled with roots. Mignonette is not a first-class room plant, but may be grown tolerably well if kept near the glass in a cool room, and regularly watered. Its grateful fragrance, however, makes it worth almost any trouble.

THE early part of September is a good time to prepare room plants generally for their Winter work, the production of flowers. The abutilon is an excellent plant for room culture, being easy to grow, generous in bloom, and adapting itself very well to the changeable conditions always to be found in the best of rooms. There is often, however, too much heat for this class of plants. The best and most satisfactory of the abutilons for room culture is the Abutilon Mesopotamicum (Megaponticum, Mauritanicum, etc.), and the variegated form is much the most striking, and blooms abundantly. Old plants I cut in freely, and either shift into a larger pot, or, if already in a large pot, pare off an inch or so of the roots and soil, and return to the same pot. In this case manure water must be used occasionally during the Winter. I prefer to grow the abutilon as a standard for the room. Cuttings will strike readily if put in now, and make good little winter-blooming plants, coming in, however, a little late. The best yellow I have grown is William Fowler, and the best dwarf white, Snowstorm. Of the dark-colored kinds, Santana is the best for rooms. I must say here, however, that the abutilon does not enjoy an immunity from insects, though it has been so stated. The scale and the green fly are the principal enemies to contend with, and will make trouble unless watched.

HORTICOLA.

LOST RUBIES RASPBERRY.

I SEND the RURAL a cut of this berry, plants of which were sent to it last Spring for testing. It appears to have some foreign blood, yet endures from 10° to 20° below zero without injury, unprotected, in various parts of the country. With me it has proved more vigorous and productive than the Cuthbert, and it is also larger and firmer. I have found no red raspberry equally productive if planted near some other variety; if planted in an isolated position the fruit is apt to be imperfect. Lost Rubies appears to be a new variety, but I have no evidence that it is, and recommend it solely on the merits of hardiness, productiveness, fine quality, beauty and vigor. I have fruited it six years, during which time it has never failed to yield large crops, and it has ever been the favorite with the pickers, on account of the rapidity with which it fills their

FIG. 469.

baskets. Last Winter was a severe test on the hardiness of plants, but the canes of Lost Rubies, standing often six feet high, uncovered, in the open fields where blackberries and peach buds were ruined, were entirely uninjured. Secretary, P. C. Reynolds, of our Western N. Y. Horticultural Society, says it is as large and handsome as the Franconia.

Clifton, N. Y. CHAS. A. GREEN.

[Mr. Green states, in a private note, that the cut of "Lost Rubies" exaggerates the size of the berry, though it is naturally large.—EDS.]

Rural and other Seeds.

I give results of some experiments with "RURAL" and other seeds.

Branching Sorghum: only a few seeds vegetated; after getting a start the plants grew well, but the drought damaged them seriously. It certainly branches freely.

White Elephant Potato: yield of fine potatoes only some 20 or 30-fold I think. The plants were injured much by fowls.

Dianthus: quite a number of plants giving exquisitely beautiful double and single flowers.

Washington Oats: I received, I suppose, about one ounce; drilled them in fairly good land and gathered about half a peck: handsome grains.

Asparagus: I have plants of both varieties sent, but of course cannot yet judge of their value. So much for the "RURAL" seeds. I will now give results with some procured from other sources.

Blount's Prolific Corn—(from Peter Henderson): I planted about an acre and a half. It is not yet gathered, but I estimate the yield at about 40 bushels per acre, though the season has been bad and the corn stands too thick. I think the crop at least 25 per cent. greater than it would have been if our native corn had been planted. My neighbors are asking me to reserve seeds for them.

Of muskmelons of half a dozen kinds, Bay View (seeds from the Agricultural Department, U. S. Government) proved best and is the only sort of which I saved seed.

Perfect Gem Squash—(seed bought of Thorburn & Co.), I had several flourishing vines and many blossoms, but *not a single specimen of fruit*. I cannot imagine why.

Beans: Of the Black Wax, Golden Wax and Ivory Pod—all snap beans—the first appears to me still the best.

Sugar Corn: Stowell's Evergreen and Egyptian are both very fine—better than any others that I planted. W. R. G.

A Very Pertinent Inquiry and Good Suggestion.

WHY does not some person (or persons) tackle and solve the question how best to destroy the aphis or plant louse pest? The only cures I have ever heard of are, 1, a strong tobacco decoction, or, 2, one from quassia chips into which aphis-infested shoots are to be dipped. These, more especially the quassia decoction, will kill the lice without injury to the foliage. But we want something cheaper and more easily applied. Is it the bitter of the quassia that kills the aphis? Might not the weeds boneset (thoroughwort) or burdock or tansy or wormwood, poplar or willow-bark in decoction also kill them—or, better still, is there not some dust as effectual and practical as Paris-green with plaster for the potato bug? Will not lime, salt or soda or some other cheap mineral combination do it? For one, I am heartily ashamed that I have not more widely experimented on this wretched pest. And, for one, I mean to do better in the future, beginning if possible to-morrow as to-day is Sunday. Will not many of your noble army of correspondents, agricultural college professors and amateur horticulturists as well as professional nurserymen and fruit growers unite at once in the good work of removing this opprobrium of this latter day from our horticultural escutcheon? Think of it—fifty million live Americans so irremediably nuisanced and damaged in their horticulture by this insignificant aphis or green-fly! Who will first discover and publish a cure? F.

The Vineyard.

THE CREVELING GRAPE.

SOMEBODY has blundered in the botanical classification of this grape. The books place it in our Labrusca class; but it is really a hybrid between Vitis Labrusca, and Vitis Cordifolia. The proof of this is demonstrated in growing seedlings from it. Some three or four years ago I fertilized a cluster of Creveling with pollen from Iona, and have now grown 20 or 30 seedlings from the cluster. Most of them are strongly marked Labrusca grapes; others seem like hybrids; but several of them are clearly, and unmistakably of Cordifolia origin. Where did these Cordifolia vines come from? Surely not from Iona, for I have often grown Iona seedlings, and have never seen any evidence of a cross in that grape. Some of them look exactly like Catawba, showing clearly Iona origin. I think growing seedlings the surest test of classification. I have always thought the Creveling a hybrid; but supposed from the appearance of the panicles, that it was between Labrusca and Æstivalis, but I was mistaken. If some of our botanists would revise the botanical classification of our native grapes, it would be a genuine and much-needed contribution to our horticulture. D. S. MARVIN.

Miscellaneous.

Espaliers.

The figures of these as trained and exhibited at the Paris Exposition of 1878, and copied into the RURAL of Aug. 6th, are very pretty to look at, and in the northern climate of Europe—particularly in the moist, cloudy and rainy districts—the trees grow well and produce abundantly. In Great Britian some kinds of fruit cannot be ripened in open ground except by training the trees espalier-fashion against a wall or plank fence. But in the United States, even as far north as Massachusetts, I have rarely seen good results from espalier-trained trees. The trunks of the trees being left bare of any shading by the branches, seem to suffer from our hot suns, produce inferior fruit, and soon die. In the American, hotter and drier Summer climate, the shade and moisture of the branches drooping over the stem of the tree, seem necessary for its healthy growth and a good production of fruit. Standards therefore are much to be preferred.

WILLIAM RENNIE, Toronto, Ont., Canada. Circular of seed wheat.

WE HAVE received from the Kansas State Board of Agriculture its Second Biennial Report for 1879-80. It is a volume of 640 pages; is full of agricultural information, and reflects much credit upon its compilers. The first 108 pages are devoted to colored outline maps showing the railroads, water-courses, post offices and school-houses in each county, and at the end is a map of the State. A statistical table, or summary by counties, showing number of acres, product in and value of the several crops for 1879, occupies pages 109 to 226. "Kansas Topography, her timber, coal and building stone resources," "Taxable pro-

perty" of Kansas, her churches, newspaper press, railroads, etc., make up the balance of this interesting report. It is worthy of imitation by many other States that now seem to think "the less said about agricultural matters, the better." J. K. HUDSON, Secretary.
Topeka, Kansas.

R. H. ALLEN & Co's., Catalogue of Agricultural Implements, Seeds, Fertilizers, etc. Office 189 & 191 Water St., N. Y.

OHIO CROP AND STOCK REPORTS for July and August 1881, comprising reports from every county in the State, together with a paper on values and valuations of Fertilizors, also one on the Ohio Fertilizer Law, by W. I. Chamberlain, Secretary of the State Board of Agriculturo.

TARIFF TRACTS, Nos. one and two, on the American Policy of Protection to Home Industry, published by the American Iron and Steel Association, 265 South Fourth Street, Phil.

VETERINARY MEDICAL REGISTER of the U. S. compiled for the Journal of Co-operative Medicine, W. L. Hyde & Co., Publishors, 22 Union Square; N. Y.

THIRTEENTH QUARTERLY REPORT of the Penn. Board of Agriculture for June, July and August 1881. Thos. J. Edge, Sec.

SECOND QUARTERLY REPORT of the Georgia Department of Agriculture, for the quarter ending July 31, 1881. J. T. Henderson Commissioner.

RURAL BRIEFLETS.

A COMMUNICATION from a correspondent in Washington, Ga., states as follows: "A carload, (a little over 300 bushels) of wheat was shipped from this depot on August 30, to the Department of Agriculture at Washington, D. C. The price paid for it was $2.50 per bushel. It is known as the Bill Dallas Wheat, and has been raised successfully for about half a century in the neighborhood where this shipment was purchased."

We have never before heard of this wheat. The price considered, it should prove something extraordinary.....

FROM a subscriber who has shown his friendship towards the RURAL NEW-YORKER in many ways we print the following note:

"IN reply to your letter of Aug. 12, making inquiries in regard to Golden Grains Wheat losing its beard. I would say that it does not lose its beard until a few days before ripening. In answer to your next inquiry "Do not they fall off as in the Centennial?" I would say that they do not; that the Centennial does not lose its beard with me. It does seem a hard matter to convince you of the merits of Centennial and Golden Grains. I have raised them both and find a wide difference between them. The Golden Grains is similar to the Centennial; the difference is in the wheat; the Golden Grains is much the larger in kernel. In order to convince you that you are wrong—if you desire to be fully acquainted with the two varieties—I can send you samples of each; sow them side by side and carefully note their growth. It does seem to me that you among all others should be fully posted in regard to the different varieties of wheat, as your Wheat Special is an interesting paper; but it should on all matters pertaining to growth and culture be in advance of the times, not behind."....

THE Black-bearded Centennial loses its beards just as the grain ripens, first turning black. That is just what the so-called Golden Grains does, in so far as we are advised. We have shown heads of both to good judges of wheat, and they have been unable to determine which was which. We have compared the kernels also of both kinds, and no difference either in size or appearance (even under a magnifying glass) presents itself. It is true, as our friend states, that the RURAL should be in advance rather than behind the times in such matters. We have been the first to remark upon the similarity (identity as we believe) of the Black-bearded Centennial and Golden Grains, and the evidence we have accumulated in proof surely does not justify our friend's reproach.....

IT should be worth something to the public to be informed that they have been paying from $60 to $100 per bushel (or at that rate) for a grain disguised as new by a well selected, ingenious name; though under its true name it could have been purchased for a small part of such prices.....

SEVERAL of our leading seedsmen were induced to buy and sell the "Golden Grains" Wheat from the claims made for it by Haines & Co., of Philadelphia, who were supposed to control it. We have the assurances of two of those leading seedsmen that they believe it to be Black-bearded Centennial, and that they will henceforth sell it under that name.....

OF all our roses this year Antoine Mouton and Mad. Charles Wood are the freest late bloomers. Both are what is called Hybrid Perpetuals—the first of a lively red color, large and finely shaped; the second of a brilliant crimson, large and as double as it well can be.
.....

THE watermelon seed from Mr. B. F. Rogers, of Orville, Ala., ripened fruit Aug. 25. They are large, long, dark-green with darker stripes, thin-skinned, crisp and sweet. The flesh is pink—seeds white. The largest weighed 21 pounds. All melons in the neighborhood of the Rural Grounds this season are small and scarce.....

WE print the following letter because it pithily presents a subject respecting which many have written us:

"I am sure you do the patrons of your excellent paper great injustice by omitting to furnish an index of the principal matters in each number. Often, very often, one wishes to refer to back numbers for some information on a particular subject, and the time, trouble and difficulty in finding it renders the attempt often fruitless and always annoying. This would be and ought to be remedied by an index of the principal subjects in each number. I had rather add 25 per cent. to my subscription than to be without the index; indeed I think the index referred to would add that amount to the value of the paper."
Mt. Lebanon, N. H. E. H. K.

A comprehensive index to each number of the RURAL would fill the better part of one column. The paper is already so crowded that we find it impossible to do justice to our contributors and to the several departments which it is desirable should be fully treated. A weekly index costs us nothing, and we are very willing that their wishes should be deferred to. It is not easy, however, to determine whether a majority of our readers do or do not prefer the index. It should be borne in mind that our annual index is prepared with great care, and that that fully serves for reference to all except the numbers of the current year. It seems to us that the weekly index is not worth the space it would take.....

WE have received from Messrs. Holmes and Sweetland a sample of Scotch Fife Wheat weighing 61 pounds to the bushel, yielding 35 bushels to the acre and harvested Aug. 7 to 12 of this year. It was raised by Mr. Nels. Overbee, of Moorhead, Clay Co., Minn.....

What Others Say

WHAT IS A POLLED ABERDEEN?—We make the following extracts from an interesting article in the Ag. Gazette (England) discussing this question: Herodotus, in his Fourth Book dedicated to Melpomene, notes the existence of polled or hornless cattle among the herd of the ancient Scythians. Possibly this is the earliest notice of polled animals of the bovine species. . . . . One of the earliest notices of polled cattle in Scotland is made by Hector Boece—educated at Aberdeen University, in his work published early in the sixteenth century. Captain Birt, 1725, in one of his noted "Letters," describes the singular appearance, "like so many Lincolnshire calves," presented by 50 cows that "had no horns," in swimming across a ferry. Sir Walter Scott in his Old Mortality (the scene of which, however, is laid about 1670) mentions a "humble-cow—the best in the byre," of Niel Blaine. Dr. Norman Macleod in his Reminiscences of a Higland Parish, gives a beautiful legend, the "Spirit of Eild," in which "three dun, hornless cows" figure as the embodiment, apparently, of ideal bovine beauty and purity, and it is interesting to note these dual characteristics of the Highlander's "fairy cattle" The last three references must allude to Galoways, which however, it should be noted, were previous to 1750 universally horned.

There are six words we are acquainted with applied to hornless cattle—"hummlio," "doddie," "cowie," "maol," "nat," "poll." We have seen that there are at least three varieties of the first. Dr. Johnson thought it allied to humble (the same, he thought, as its use in that in the stingless "humble bee"). But Jamieson differs from the great lexicographer, and shows it has no affinity, but is derived through "homyl," from a root signifying mutilation, and allied to "hummelled," as applied to barley.

Any visitor to the Birmingham or Smithfield fat stock exhibitions at Christmas, or the great London Christmas market at Islington, will not long remain in doubt as to "What is a Polled Aberdeen?" In the many circles connected with the manufacture of meat—of all the now highly wrought beef-producing machines, the Polled Aberdeen is the acme—the very term is the world-wide current superlative of perfection. The Aberdeens, as seen densely lining the rails of Copenhagen Fields, display their characteristics grandly. They have a fine expression of countenance—mild, serene, and expressive. Fine in the bone, with clean muzzle; a tail like a rat, and not ewe necked; short on the legs; a small, well-put-on head, a prominent eye; a skin not too thick or too thin, covered with fine silky hair to the touch like a lady's glove; a straight-backed, well ribbed up, and well ribbed home: hook bones not too wide apart—level from the hook to the tail; well set in at the tail—free from patchiness there and all over; deep thighs, with a good purse below him; well fleshed in the fore breast, with equal covering of fine flesh all over his carcass. Such an animal he is, that when standing behind you can see all his points at once, and altogether with the appearance of his perfect "meatiness" bursting out of his seal-skin, smooth, and glistening covering.

As to early maturity we need not say much. The Editor of the North British Agriculturist, some years ago, declared he could produce evidence on this point so abundant that "he would not be able to find room for it in one whole issue of the Agriculturist." Partisans of other breeds have since the Paris exhibition had this very thoroughly, we think, impressed on them. . . . . A great deal is written and spoken about "Aberdeenshire crosses;" Short-horn men indeed seem to find in this a never-failing text to advance the praises of their own favorites. So they well may, for in how many reports of English Christmas exhibitions do we read "the Polled Scots and Aberdeenshire crosses continue to be the backbone of the exhibition." . . . . . For some time back the use of the Short-horn sire has rapidly given place in the north to the use of the Polled Aberdeen sire on Short-horn and cross cows. This method is giving the greatest satisfaction, and the best crosses we have ever seen have been so manufactured. The result of such is that such cross is at least three-fourths Aberdeen. These facts are highly important to owners of other breeds who are turning their thoughts to the "all round" Aberdeens.

As to the milking properties of the Polls, if they have been supposed to be naturally inferior milkers it is a misrepresentation of facts. The old Aberdeens early in the century were traditionally famed as dairy stock. Youatt records them to have been great milkers and butter cows, and states that among the best dairies they yielded up to seven gallons per day. Such were their capabilities that they compared fully with the Ayrshires, and were introduced into the northern counties on account of their dairy fame.

A WORD or two as to the relative positions of the Polled and Short-horn breeds in the North. During the last few years the Polled have turned the tables on the latter in every possible way. The Polled have increased in favor day by day, obtaining every day new and more favorable supporters, making better and better appearances at shows, and extending far beyond its boundaries in every direction, with a greater demand for animals for the south of Scotland, England, America, and the colonies. These results are easily traceable to the enormous advantage and prestige gained for the breed at the Paris Exhibition of 1878, the fame of which has penetrated the remotest corners of the earth.

WE have often had occasion to admire the shrubby Magnolia Halleana or stellata, a specimen of which thrives finely in the Rural Grounds. Mr. Samuel Parsons, Jr., in his prize essay read before the Mass. Hort. Society, says that it is the most compact and slow-growing of its race. It has been introduced from Japan for many years, but has not until recently been received with anything like the attention it deserves. The leaves are dark-green, somewhat small for a magnolia, and given to disposing themselves in very picturesque masses. If it is the most dwarf of Asiatic magnolias, it is also the hardiest and most readily transplanted. Its prime charm consists in its flowers. They are more than creamy-white, they are snow-white, with a peculiar brilliance of texture; but, more than all, they are delicately fragrant, more fragrant than any other hardy magnolia. When open, these flowers, which come earlier than the bloom of any other magnolia, and before the leaves, remind one of the star-shaped clematis, but in their loveliest form, half-opened, their graceful curves are like those of white water-lilies. The earliness and beauty of this flower, and the sudden manner in which it bursts into bloom, indicate a capacity for producing early forced flowers of the finest quality.

WHEN TO CASTRATE FOALS.—Farmer Miles, the American veterinary surgeon, advised a writer in the London Agricultural Gazette that foals should be castrated when about four months old, *i. e.*, as soon as the parts are sufficiently developed. The humanity of the practice is undoubted, for a foal is easily thrown; he seems scarcely to suffer from the operation, as immediately he is released he gets up and runs to his mother as if nothing had happened; there is little or no swelling, merely a slight stiffness for a few days, and there is no trouble in keeping him by himself for the first Spring.

BROAD TIRES.—A writer in the Times says that a year's experience with broad wagon-wheels is conclusive as to their value. A four-inch tire will carry two tons over soft ground with greater ease to the team than a two-and-a-half inch tire will carry one ton. The wheels are not so much strained by stones and rough tracks on the road and the road is not cut up, but, on the contrary, is packed down and keeps smooth. The prevalent idea that the draft is increased by widening the tire is altogether baseless; on the contrary, a wide tire reduces the draft. The extra cost of the tire is repaid many times over every year in the extra work that can be done by a team.

THE MUCK DELUSION, remarks the Editor of the excellent Journal of Chemistry, which prevailed twenty or more years ago, regarding the manural value of what is known as *muck*, has lost some of its force, but it still exists among farmers, especially those new in the industry. . . . . The fallacy of muck consists in the error of regarding it as manure, or a substance which turns spontaneously into manure without cost to the farmer. The term "muck" is usually applied to the dark, wet, unctuous product of low meadows, and the black mud from the bed of marshy lakes and frog ponds. . . . . If it had absolute or potential value as manure, the wet mud from meadows cannot be hauled long distances with profit, but it has not under any circumstances manurial value. The peat of bogs, as freshly taken out, averages of water fully 90 per cent., and a load of this of 2,000 pounds gives but a couple of hundred pounds of dry humus at the barn. If through inexperience or want of close observation a farmer backs up his cart to a mud hole, dry in Summer, he loads into it a substance which is usually valueless. . . . . The true value of muck is well understood among chemists, or at least it ought to be. It really holds no available plant food, although it contains some nitrogen and carbonaceous elements. These do not exist in it in available forms, and cannot be brought into that state at a cost which will under ordinary conditions warrant transportation and manipulation. Muck has a certain value as an absorbent of liquid manure, and it may pay to procure and dry it for such purposes; but to meet this want it must be convenient to the barn, and of good quality.

PETROLEUM ON TREES AND BUSHES.—Dr. H. Gibbons, at a recent meeting of the California Academy of Sciences, said that since he put petroleum on the trees in his garden they had grown better and faster than ever before, and given better roses than before. The petroleum seems to kill the scale insect. The handsomest rose he exhibited was from a bush which looked nearly dead a short time before. The petroleum was mixed with castor-oil. It is applied sparingly, and great care is taken that it does not run down the roots. Perhaps in a crude state the petroleum would be bad, even on the stalks; but mixed with the castor-oil it appears to be advantageous to the plant.

AS REGARDS the distinction, nutritively considered, between the whole grain of wheat and the white flour of the interior parts, there is no room for doubt or dispute, says the Journal of Chemistry. It is the whole grain which constitutes perfect food; the white flour is incapable of affording complete and healthful support under all conditions of human existence. The white loaf is very beautiful and fashionable, but it does not contain the phosphates of magnesia, lime and soda which are found in the brown loaf. These salts are stored for some wise reason, doubtless, in the bran or outer covering of the grain, and they are certainly lost to a large extent in the bolting process.

BERMUDA GRASS ON THE LEVEES.—General Bidwell, of Chico, says the Pacific Rural Press, who has tested Bermuda Grass on the levees and as stock feed, says that he regards it as a very successful protection to levees; that it quickly forms an almost indestructible turf against the action of water, and as far as spreading is concerned, the more it spreads and covers the ground in that dry country the better. All kinds of stock eat it with great eagerness, and it furnishes an excellent and abundant supply of green feed during the dry and wet seasons alike, except when killed down a short time by frost in Winter.

MILK DIET.—From a first-rate article in the Christian Union we take the following:—"Let me feed a sick patient, and who will may give the medicine. In an illness far more depends upon the proper feeding of the sick per-

son than is generally believed. If the strength is sustained from the beginning by nourishment, given judiciously, there is better prospect of its being equal to the demand that must be made upon it later. Begin, then, from the first to give liquid nourishment in small quantities frequently. It is more easily swallowed and digested than anything solid, however delicately prepared, and as there is generally thirst, it is, as a rule, readily taken. The chief reliance must be placed on milk. One pint is equal to a full-sized mutton chop, and it is incomparably more nourishing than any animal broth, not excepting beef-tea, which has too long held a rank to which its merits are far from entitling it. . . . . Boiling meat coagulates the albumen, the principal nutritive element, converting it into a solid which is carefully eliminated when the broth is strained, leaving behind a mass of shreds floating in water. Milk, on the contrary, contains 14 per cent. of solid matter, and is rich in the constituents necessary to supply the wants of the system. One-eighth part lime-water added to the milk will prevent it from disagreeing with the most fastidious stomach. . . . . When the yelk of an egg cannot be borne, the white may be given with perfect impunity. Albumenized milk is prepared by shaking in a wide-mouthed bottle or jar one pint of milk with the whites of two eggs. These are so thoroughly incorporated by this process that few would suspect their presence, and the mixture is much more nourishing than the milk alone. . . . . Albumenized water is a refreshing and at the same time a nourishing drink. It is prepared like the milk, by shaking together the whites of two eggs and a pint of cold water, and flavored with lemon juice, a slice of lemon being left floating in the glass. Cold toast water can be used to make it.

DR. NICHOLS says that there is not a function of the body that cannot be sustained upon the principles stored up in the wheat berry; and there is not a nerve or tissue that cannot be nourished and fed by it alone. . . . . Virginia proposes to have an industrial exposition of her own. Good luck to her! If the world knew her resources she would not be troubled about how to pay her debts.—Herald. . . . . For every tree cut down at least two should be planted. . . . . The Emperor of Germany has, by imperial decree dated June 1, 1881, awarded the gold medal of merit for agriculture to Mr. Lawes and Dr. Gilbert jointly, in recognition of their services for the development of scientific and practical agriculture. . . . . The over-feeding of exhibition cattle was the theme of the Earl of Lathom's remarks at a late show in England. The noble lord said it might be asked why he did not exhibit, and his answer was a very simple one—because he did not like spoiling his animals by getting them fat for show. . . . . An Iowa paper, the Cherokee Times, thinks that the large increase of wire fences in that State may be responsible for the unusual slaughter this year of live stock by lightning.—N. Y. Tribune. . . . . FIGARO:—"Un très vieux général vient d'épouser une jeune fille de dix-neuf ans. Tout heureux, il demande à son ami intime, un médecin. 'Crois-tu que je peux espérer d'avoir des enfants?' 'Espérer,' réspond le médecin, 'Oh! non! craindre, c'est une autre affaire.'"

Everywhere.

RURAL SPECIAL REPORTS.

Arkansas.

BEEBE, White Co.—Have had an extremely dry spell of hot, dry weather that has burnt up all vegetation. Corn has been cut short and no fodder has been saved. Cotton opened prematurely and the bolls are very small; the yield won't be half as large as that of last year; so say my neighbors who have been raising cotton, and little else all their lives. Everything is suffering for want of water, even the leaves of the trees are "browned" as if by frost. I live near the road and never saw so much travel in this section. Some say they are from Texas going North and West, because they cannot see how folks can live in their part of the Lone Star State, as there was nothing to live on when they left; others come from nearly all parts of this State, all seeming to be disgusted with their own sections and seeking some better place. My crops are poor enough; but every one of the wayfarers envies me, as mine, they say, are much better than those they have seen in their wanderings. A neighbor of mine has just returned from a visit to Monroe and Woodruff Counties and he says people there are miserably off; most of them having mortgaged their crops and those who had land having given trust-deeds on it to the merchants. Many renters have moved away leaving uncut small crops to pay big debts. Many hogs are dying hereabouts, more I think from want of food and drink than from any disease. Even the people here have only corn bread, pork and now and then a little wheaten flour. Folks complain of lack of vegetables, but I fear many will be sorely stinted in their present diet before next harvest. Merchants in the towns are refusing to give any more credit—and the Lord help those that need it. H. B.

DAYTON, Sebastian Co., Sept. 5.—A two months' drought still continues. Stock are suffering for water. The wheat crop almost a total failure. Oats fair. Corn hardly half a crop. All Winter wheat. Cotton runs from 250 to 450 pounds per acre—mostly the former. Fruit and vegetables a total failure. Very few peach trees stood the hard Winter. Most of the apple trees are dead. So are most of the small fruits. G. W. R.

California.

SANDERS, Fresno Co.—The RURAL's Florida correspondent's experience with his "flayed elephant" is so in contrast with mine that I cannot forbear sending a statement of the facts in my case. I cut mine into single eyes, and planted them in my best potato land, on a ridge between deep furrows: the furrows were filled to heaping with stable manure which was kept saturated with water admitted through a bamboo stalk from my irrigating ditch. On Aug. 10th. I dug them,—130 pounds from the single tuber. These are planted and being cared for in like manner, and from their appearance I have contracted to deliver two-and-a-half tons of their product in November at five cents per pound, and shall have quite a stock of Elephants still on hand. W. A. S.

Canada.

TORONTO, Ontario Co.—Winter wheat which was sown early averages 35 bushels to the acre, but that which was sown late is a failure. Barley averages 36 bushels to the acre. Oats are very heavy and average 55 bushels. Peas look well and promise to be an excellent crop, but we are obliged to sow them late in order to escape the pea weevil. No clover seed. The apple crop is very deficient. No cherries, and very little small fruit of any kind, with the exception of grapes. The Washington Oats far exceeded my expectations. From the small package received there is the enormous yield of 18 pounds. A. R.

Connecticut.

BLOOMFIELD, Hartford Co., Sept. 13.—The people of this section have cause for rejoicing in that abundant crops are the reward of their labors. The cold and plentiful rains in early Spring, that served to delay the season, making it at least two weeks later than usual, aided in producing a plentiful crop of grass, a product of the first importance in this vicinity. The late season, however, somewhat interfered with the usual routine of farmers' work, and at the time when haying is usually completed, tobacco demanded attention, and the result was that grass was in the meadows later than in any previous year since the advent of mowing machines. Tobacco started late, but has grown rapidly during the past four weeks, promising a fair crop, some of which is already housed. Corn is looking well, and potatoes promise a good yield; but I hear fears expressed that they may rot. Some "White Elephants" that found their way here in consequence of the notices in the RURAL, have given satisfaction; but it is believed they have not done themselves justice so far as size is concerned. The tops which were luxuriant, measuring between four and five feet, after a heavy rain suddenly stopped growing. The potatoes are large when compared with other varieties, but have not as a whole attained the size expected. I think I have never seen the fields greener or the forests more luxuriant at this season. The frequent rains have kept everything in growing order, and while we read of the terrible droughts in other sections, we feel thankful that this is not so afflicted, and it seems to me to be fortunately situated in this respect, for during the past 40 years I do not remember more than two or three instances where any crop has been materially injured by drought. Occasionally a well will be exhausted or a pasture stream become dry, giving a little inconvenience; but such droughts as frequently visit other sections are here unknown. Regarding fruit: This is an "off" year for apples, and the supply is scarce and quality poor. Pears are abundant, but not so fair, or good in quality as in some years. A few peach trees I have seen are giving evidence of the return of what may be called the peach cycle—of which I spoke last year, being laden with fruit. Who can give a reason for the fact that in this county peach trees will for a few years flourish and bear well, then all die out, and for another term of years it will be as impossible to raise peaches here as oranges. Since my remembrance there have been at least three of these cycles. An old farmer told me a few days since how he killed Canada thistles which I will add in closing. He said "I cut 'em close, put on a lot of brine, and sprinkle with salt beside. Then turn in sheep, and they, to get the salt, eat the thistles so close I never see more of 'em." L. A. R.

WATERBURY, New Haven Co., Sept. 8.—The W. E. Potato I received weighed about 2⅛ ounces. It had 14 eyes and I planted them 10 inches apart on May 1. When dug on Aug. 22, I had 64 tubers which weighed 16½ pounds. I never saw nicer-looking potatoes, and shall keep them for seed. I have already been offered for my potatoes more than the cost of the RURAL for two years. I picked off from that one potato 451 potato bugs—a good crop I think. M. D.

Florida.

STARKE, Bradford Co., Sept. 5.—The outlook for crops in this section of the "flowery land" is very poor. During the months of May and June we had scarcely any rain at all: through July, in this immediate locality, we had just about enough. The first half of August we had very little, and since then have had none, and the result is we are getting very dry. There are places within ten miles of us where the ground has not been thoroughly wet all Summer. Corn is mostly harvested, and is generally a very light crop. With a little more rain cotton would have been fine; now it is rusting badly and the crop will be materially shortened. Of course, rice and sugar-cane are each suffering a great deal, and so are sweet potatoes. Plenty of rain soon would help the two latter, but it is too late to do cotton or rice any good. We have had a visitation from a species of Army-worm; they ate the grass in some places all up and injured the early rice so that it had to be cut for fodder. The old farmers say it is the worst year for crops "since the Surrender." Young orange trees never made a finer growth, and are looking remarkably well; you would never suspect they were so severely nipped last Winter, but the old trees still show the effects of the cold and do not look half as well as last year at this time. I. S.

Illinois.

CHAMPAIGN, Champaign Co., Sept. 12.—Saturday we got a couple of showers and since it has been cool—though at this time of writing the wind is blowing strong from the Southeast and the mercury is rising fast. The sky is as blue and clear as a sapphire, but the barometer says a change is coming and we shall probably have more rain in the course of 36 hours. The rains of the tenth together with a previous one on the fourth, have partially broken the drought in this section; but over the South part of this State the drought reigns supreme. There is almost no pasture, except dried grass; and nothing good to feed except it be corn planted for the purpose. Prices have risen nearly 100 per cent. within a year, and corn now sells for 55@58c., Oats, 36@40c.; wheat, $1.25@1.35.; hay; $10@12 per ton; sweet potatoes five cents per pound; potatoes and apples a dollar a bushel each, while most other vegetables are brought from abroad. More than half the wells in Central Illinois are dry; half the labor of the country is employed in digging new ones; farmers, in some cases, daily drive their stock miles for water; in fact, we are suffering all the evils of a protracted drought. Little plowing and less seeding done for wheat on account of the refractory character of the soil and fear of the chinch bugs which swarm in the corn. Another good rain or two, would allow of land being broken with comparative ease, and then plows would be set to work in a very lively style. There is no doubt of a very much enlarged seeding to rye and of a great deal of land to be broken for Spring crops between this and December if the weather admits. Notwithstanding local pride reports great things of the county fairs this year, they are in most cases miserable failures and very fully represent the general failure of crops along the whole line. B. F. J.

PRAIRIE CENTER, La Salle Co.—The Argenteuil Asparagus came up well and is growing nicely; so are the pinks and oats. The Rural Branching Sorghum was a failure, and the White Elephant suffered too much from lack of water to do well—its progeny weighed only nine-and-a-half pounds. From one pound of Chicago Market I got 40 pounds, and from a pound of Mammoth Pearl, 42½. J. P. W.

RANKIN, Vermillion Co.—Owing to a very long dry spell, the late potato crop to all appearances is a complete failure. The same may be said of the corn that was planted very late. Early planted corn, especially that on fall-plowing, will, some of it, husk out 25 to 30 bushels per acre. There are but very few apples here; almost any kind of a cooking apple will sell for $1 per bushel. No peaches; a few grapes. The pastures are dried up, and almost every one is feeding his stock to keep them from starving. I have been in this State 15 years, and it is the severest drought I have seen to commence so early. Hay, oats and flax were pretty fair crops, and that helps the matter a little. Many of the renters will have rather hard times till another crop is raised; but they are much worse off in the Southern part of this State. Down in Clay Co. the report is that everything is burnt up, and some are selling their stock for anything they can get for them to keep them from starving and to get something to live on or to get away from there. H. MCC.

Indiana.

BISHOP CREEK, Mono Co.—Yield of Washington Oats, from six to seven quarts; badly smutted. White Elephant doing extremely well, from present appearances many of them will weigh one pound each; planted in dark loamy soil. R. B. Sorghum from six to seven feet high in full seed. Asparagus not doing well. We are having an abundant harvest in this county. J. B. S.

KINGSBURY, La Porte Co., Sept. 8.—The R. B. Sorghum seeds grew fairly, but owing to a poor season the plants have not done well. The flower seeds grew well, and for beauty are all that could be desired. The asparagus is doing well. The W. E. Potato weighing three ounces, yielded, when dug yesterday, 16½ pounds of good-sized tubers. The largest yield from one eye was two-and-one-half pounds. We have had no rain of any consequence since July. Corn not more than half a crop. Potatoes poor; late varieties a total failure. They are selling from store for 40 cents per peck. Farmers are ready for seeding Fall wheat, but are waiting anxiously for rain. W. E. H.

Iowa.

CRAWFORDSVILLE, Washington Co.—The White Elephant I received measured around it 4 by 4¼ inches. Having 17 eyes, it was cut into 17 pieces, some being very small. They were planted in a box in the house, and transplanted to the garden when the plants were from half an inch to four inches high. The smallest one died. The rest were dug August 31, and yielded 13¾ pounds. They had been somewhat wilted in the ground owing to the dry weather since June; about 80 were as large as, or larger than, the one received, and, counting all down to those one-third of an inch, there were 125, or about one-third of a bushel. The weight shows less, from their being so dry. The W. Oats fell down and so I nearly lost them. We planted the asparagus in a box also, as we did not wish to plant it till next Spring. It looks well. J. H. M.

TIPTON, Cedar Co.—Corn greatly damaged by drought. Potatoes also dried up—a short crop. From the single W. E. Potato I have obtained 69 pounds of nice, clean medium sized tubers. They stood the drought well without watering. The Washington Oats yielded 3¾ pounds. The R. B. S. has made a heavy crop, but I think it wont take in the Northwest. The pinks are beauties. Wheat hereabouts a failure; oats yield from 20 to 30 bushels per acre. E. A.

Kentucky.

ELKTON, Todd Co.—We are having the most severe drought known for a good many years: no rain of consequence since the last of June. Tobacco late and very small. Corn dried up; will not yield more than one-fourth of a crop. Wheat very light. Oats fair. Potatoes did not mature on account of the bugs, which came early and still hang on. No fruit worth naming. Pastures completely dried up. Stock water very scarce. Everything looks gloomy and indicates "hard times" in the truest sense of the word. E. D. M.

Maryland.

RAYVILLE, Baltimore Co., Sept. 8.—I planted the Rural Branching Sorghum May 14. About nine-tenths of seeds failed to germinate and what few did come up made but very little progress until July 1, when it began to grow rapidly and is now about six feet high, with from five to eleven stalks from each seed. On the 19th of July, when it was 2½ feet high, I cut two hills—one containing 11 and the other seven stalks—about 2½ inches above the ground. On the 4th of August, the same hills were cut again about five inches above the ground and the stalks measured 2½ feet after being cut. On the 31st of August the same hills were cut the third time about seven inches above the ground, the stalks being over 2½ feet high when cut. These same hills have since the last cutting grown eight inches. This I consider a remarkable growth for such a dry season as we have had in this section. There have been but three showers since the 21st of June, and neither of them wet the ground to the depth of three inches. The White Elephant Potato was cut into 10 pieces and one piece planted in each hill on April 26; but owing to the drought they were almost a failure. They were dug September 2, and yielded 4½ pounds of very small potatoes. The "Washington Oats" yielded well, but it seems to me that it is the same variety of oats that was distributed by the Department of Agriculture, as the "White Schoenen" Oats and which I have been raising for 15 years past. In this section the crops are about as follows: Wheat and oats about the regular average; rye better than for several years; corn, about half a crop; buckwheat, a total failure; pasture, burnt up.

Streams failing; prospects for rain—none. Vennor—a false prophet. The flower seed came up well, and among them are some beautiful varieties: the asparagus seed I gave to a friend, it being a plant that I take no stock in. P. S.

Missouri.

GLASCOW, Howard Co.—The R. B. Sorghum has made a splendid growth and withstood the drought better than anything in my garden. The asparagus came up very well, but the White Elephant Potato was a failure. I had it planted with great care, the vines grew very strong and large, but when I had them dug I found a mole had passed the entire length of the row, and I got less than half a gallon of tubers. These I will preserve with great care for next year. H. Q. B.

Nebraska.

DELOIT, Holt Co.—Crops generally are good, but wheat was very nearly a failure, the yield not averaging over five bushels per acre. Oats are much better than last year, and barley as well as rye is a fair crop. The Rural Branching Sorghum is just as it was recommended. The W. E. Potato is doing exceedingly well, and were it not for there being some smut, the Washington Oats would have been fine. The flower seeds did not all grow, and those that came up didn't do well, as they were planted too late. Small fruits good. D. E. H.

WAHOO, Saunders Co.,—I dug the White Elephant Potatoes Aug., 25th. I had 30½ pounds in actual weight—25 extra large, 50 medium, and 40 very small tubers. I think this a very good yield under the circumstances, as the bugs and drought killed the vines before they matured. I shall save every potato for seed. We had no Spring here this year, for severe cold immediately succeeded hot weather. Wheat a total failure; hundreds of acres were never cut; what was cut is making from three pecks to ten bushels per acre. Flax over an average crop. Oats light—about 27 bushels per acre. Late corn has been hurt by drought, but I think there will be over half a crop. Hay plenty. Wheat worth $1; oats, 25c.; potatoes, $1; corn, 35 to 40c.; hogs, $5 to 5.25 per 100 gross. I think the Rural the best agricultural paper I ever read. I I could not farm without some paper of the kind. "A SUBSCRIBER."

New Jersey.

TITUSVILLE, Mercer Co.—Corn will probably be one-half of an average crop—not half of last year's crop, as that was above an average one. In this township there are many acres that will not give one bushel each. Oats were 30 per cent. better than the average. Wheat the usual yield. Not ono field of green pasture to my knowledge in this section; most of the farmers are feeding and foddering the cattle. There are some who take no paper and do not know that cattle get hungry and neither grow nor give milk when starved. There are a great many unruly cattle, and an empty stomach makes fences poor. But little is being done toward seeding, the ground is so dry. The trees in the forests are, many of them, turning dry, and, what is worse, apple-tree leaves are turning as though the Autumn frosts had come and chill November were here. In many cases the fruit hangs on the bare limbs and will probably wilt up and die. We had a large crop of Bartlett Pears, or, rather, we would have had if they had grown to the usual size. Some of them wilted and hang on the tree, while the leaves are on the ground. The leaves of the Vicars are dropping; in fact, we can see the effect of two months' dry weather in the hottest part of the year. What effect rain would have on the trees is a question of conjecture; some are doubtless dead, and I think it now too late for most of them to leave out; even the evergreens are dying. I. J. B.

New York.

ANDOVER, Alleghany Co.—The Summer that ended with the last day of August was the hottest I can remember. On Sept. 1 a thunder storm did a great deal of damage, injuring buildings and burning eight barns and one house in this neighborhood. Potatoes the lightest crop we have ever had. I planted the White Elephant June 28 and dug up its offspring on Sept. 2, and got 20¼ pounds. I wouldn't take five dollars for what I have for seed. The Washington Oats were sown alongside of the Russian White, and the R. W. O. came out ahead. I think the W. O. are what we call the White English Oats. The R. B. S. was a failure. The asparagus looks well; so do the flowers from the RURAL seeds. Wheat, a good crop. Oats and hay, ditto. Oats, 40c.; wheat, $1.50; potatoes, 50c. C. Z. H.

EDDYTOWN, Yates Co.—I took a little run among the vineyards of Seneca and West Keuka Lakes. The vines are in good order, but the crop will be a little less than last year. On account of a rain at the time of blossoming the fruit did not set as full as usual. This was true to a small extent of Delaware, and of Rogers's Hybrids almost entirely. There is some rot in Catawbas, in a few places it is quite bad, but generally it is not of much account. W. H.

LOUDONVILLE, Albany Co.—Very little rain fell here during August, and but a fair amount during July. It is very hot, dry, dusty and smoky here now, and many crops and some trees and shrubbery, including large lilac bushes are literally drying up. Many families are out of water. I have some beautiful pinks raised from seed you sent out last Spring. A yucca plant on my brother's lawn raised from seed which the RURAL sent out several years ago, bloomed finely this Summer. Being the only plant of the kind in this vicinity, it attracted considerable attention. F. E. A.

Pennsylvania.

DAGGETT'S MILLS, Tioga Co. — I planted the White Elephant Potato on May 25 and dug them on August 20. In planting I divided some of the largest of the eyes, and planted one piece in a hill, making 17 hills. The largest of the tubers obtained weighed one pound each, and I had 65 lbs.—a very good lot. I shall save them all for seed. Last year I raised two bushels from one potato that I had raised from the seed of a potato ball, and I have named it Bly's Superior. I had one tuber that weighed 2¾ pounds. Last season was much better for potatoes than this. The White Elephant is a splendid potato. The Washington Oats have done well and are heavy. The R. B. Sorghum doesn't mature seed. The asparagus all came up well. I have about 100 hills of potatoes from the seed of the potato balls. They look well and are now getting ripe. J. B.

UNION CITY, Erie Co., Sept. 11.—My W. E. was cut into 12 pieces all of which sprouted well; but during the wet spell early in Summer six were drowned out. From the remainder I dug on Sept. 1, 24½ pounds of nice tubers. The pinks are in blossom and they are beauties. W. Oats and R. B. Sorghum I didn't sow. J. W. B.

Texas.

UVALDE, Uvalde Co., Texas.—Since May 10 there has not been rain enough in this county to wet the ground two inches; yet stock look well. Wheat averaged 13 bushels per acre—the best yield in the seven years I have lived here. To my knowledge there have been only two corn crops in this county. For myself I have been doing little or nothing except raising sheep since I came here, and in my opinion this is the only business that pays. H. N. D.

Virginia.

JUNCTION. P. O., Hanover Co.—Washington Oats planted April 1; harvested July 5; yield two pounds ten ounces—at the rate of about 38 bushels per acre. The White Elephant Potato had seven eye sets, and I was compelled to plant it as an early potato on March 25 as it was sprouting. Dug, August 15, a crop equal to that from Early Rose. The Elephant, however, is undoubtedly a late potato and the yield suffered from its having been planted too early. Shall try to keep the present crop for replanting next year, by packing the tubers in charcoal in a dark cellar. Germination of seed and growth of Rural Branching very satisfactory, considering the season. Treated as ordinary farm crop and dreadfully curtailed by the drought that dried up the region for many weeks. Asparagus came up badly, no doubt because not treated as Mr. Goodell suggested in the RURAL weeks ago. C. W. D.

Wisconsin.

COTTAGE GROVE, Dane Co., Wis., Sept. 10.—Some of the R. B. S. has been headed out about ten days. Think seed will mature enough to grow. May 6 I planted W. E. Potato weighing about four ounces, cut into ten pieces, with one eye in a piece and one piece in a hill. Dug 37 pounds yesterday—ripe more than a week ago. Heaviest hill, 5¼ pounds; heaviest tuber, just one pound. They were planted in good soil by the side of other potatoes, and received no better care than the rest of the field. S. O. Y. G.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

POULTRY QUERIES, ETC.

A. S. S., Waco, Texas, asks, 1, for a plan of a portable picket fence for a poultry yard; 2, are the Langshans hardy and profitable fowls; 3, are the American Sebrights pure-bred or only a cross; 4, the address of a trustworthy breeder of the above sorts of fowls; 5, is there an importer of poultry in the Southwest; 7, the name of a good market variety of watermelon.

ANS.—1. A convenient portable fence is made as shown at Fig. 470. Two or three strips of 2x1¼-inch timber form the rails, and the pickets are common sawed laths sharpened at the upper end. The laths are nailed to the rails or bars two inches apart. The bars project at the ends of the panel about three inches. Stakes are driven in the ground and the panels are fastened to them by pieces of fence wire, the end of one bar being placed over the end of the corresponding bar of the next panel and one wire fastening both to the stake. The

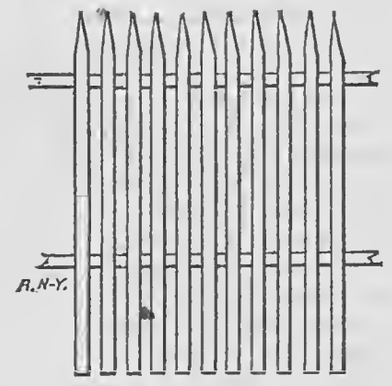

FIG. 470.

panels may be 12 feet long, and will then need a center stake, to which the bars are wired. The fence may be made six feet high by using three bars and two lengths of lath. 2. The Langshans are only Black Cochins under another name, and as yet have done nothing to merit popularity among those who keep fowls for profit, excluding those, of course, who breed them and sell them to fanciers for $20 to $50 a trio. 3. The Golden and the Silver Sebright Bantams are admitted to entry in the "American Standard of Excellence," and that secures them the distinction of thoroughbred. They have been bred long enough and closely enough to reproduce themselves accurately enough to be considered pure-breds. 4. G. S. Josslyn, Fredonia, N. Y. 5. We know of no importer of fowls in the South. There is not much importing done now, as American fowls are as good as any in the world. 6. The common Southern Rattlesnake Watermelon is a good market melon. Try the Cuban Queen.

WATER PIPES.

J. N. C., Emporium, Pa., asks where can he get pipe to convey water to his buildings.

ANS.—A few years ago there were two stores in Emporium that supplied wrought-iron and lead pipe as well as wooden pipe for this purpose—a stove and a hardware store. Doubtless either these or successors to them will supply what is wanted in this line. If not, there is a large number of dealers in these goods at Williamsport. Three-quarter-inch lead pipe weighs from one pound per foot upwards, but the lightest will be safe where there is not more than 30 feet head. Lead pipe is the best when the water is always flowing, but is not safe when the water stands in it. A very good pipe for leading water may be made of common one-inch drain tiles laid in cement to close the joints. This is clean, safe and durable. Another good kind is hemlock strips three inches square bored with an inch-and-a-quarter hole in the center with a long-handled auger. Lead pipe costs 12 cents a pound; iron pipe costs as much, and it rusts and gives a bad flavor to the water; drain tile costs about a cent-and-a-half per foot, and the cement will cost very little. Wrought-iron pipe, one inch inside diameter, costs, wholesale, 19 cents per foot; 1¼-inch, 27 cents; 1½-inch, 33 cents; and, as the retailer gets 50 per cent. discount, he can generally afford to sell it at these figures, unless he happens to be a plumber; for a plumber, like a druggist, wants heavy profits.

PINK WATER LILIES, ETC.

A. L. J., Quebec, Canada, asks, whether a pink water lily is sold by florists, and, if so, what is its name; 2, whether seeds of pyrethrum will grow in a green house, and whether it would be any protection against the aphis infesting rose bushes, if grown beside them in pots.

ANS.—There is a pink variety of our common water lily known as Nymphæa odorata var. rosea; it is fragrant, beautiful, scarce and dear; it costs about $10 a root. There is also a variety faintly tinged with pink, but the coloring is not deep enough to be satisfactory. It costs $1.50. Of the common European water lily a pretty pink form, discovered in a lake in Sweden, is also being disseminated by florists, under the name of N. sphærocarpa, but it is likewise exceedingly rare and expensive. The above are perfectly hardy. But the grandest of all red water lilies is N. Devoniensis, a hybrid raised in England several years ago. It requires very warm green-house care, and costs about $5 a root. 2. Pyrethrum will grow in pots in a cool, airy green-house, but its presence there would be no protection to the roses from aphis.

Miscellaneous.

S. T. T., Southold, N. Y., asks what kinds of white and red wheat are suitable for Long Island, N. Y.

ANS.—It is a hard question to answer, because one should sow a wheat several years in order to judge of its several qualities. We are inclined to think that Fultz (white) will yield heavily on Long Island as well as in many different parts of the country. Shumaker (amber—nearly red) has done well at the Rural Farm, yielding 32 bushels the past season without heavy manuring. Besides, it is one of the earliest. We doubt not also that our "Distribution" wheat, Fultzo-Clawson, will be found well adapted to Long Island soils in general. This has given us the heaviest yield of any wheat we have ever raised—nearly 37 bushels. Clawson, as our friend probably knows, is a favorite white wheat.

R. E., Ravenna, Ohio, says that his White Elephant Potatoes were green on August 30, while he saw by the reports in the RURAL that others had already dug theirs, and he asks whether it is not probable that he got the wrong sort, as his is certainly a late potato.

ANS.—They are late potatoes, but the season has to do with their maturity, of course. Last year, ours were not dug until late in September this year the vines were dead on Sep. 2, owing to heat and drought. You may rest assured that you have the genuine White Elephant. There can have been no mistake.

M. D., no address, asks, 1, how to increase his Snyder and Wilson Blackberry vines; 2, the price of air-slaked lime for the garden.

ANS.—1. By the suckers or by making cuttings of the roots. Cut them into small pieces and plant them in drills two feet apart the same as you would peas. Cover with light soil and press it firmly upon the cuttings. A dressing of fine manure as a mulch to preserve moisture is desirable. 2, Air-slaked lime is merely ordinary caustic lime slaked by exposure to the air, which anybody can do for himself.

D. D., Bucyrus, Ohio, asks a recipe for the cure of Chicken cholera.

ANS.—Prevention is the best "cure." All infected fowls should be killed at once, and the bodies buried, as the disease spreads rapidly. However, cures have been effected by feeding cooked meal, red pepper, gun-powder and turpentine mixed together; also dissolve one ounce bi-sulphate of soda in a gallon of water and place the solution where the fowls can drink it.

A. R. G., Akron, Neb., sends for name, 1, a kind of clover with the query whether it is a perennial or a biennial, and whether it is good for honey bees; 2, a prairie plant with a very pretty pink flower.

ANS.—1. It is the white-flowered melilotus or Tree or Bokhara Clover—Melilotus alba. The root is probably biennial. It is valuable as a forage plant, though we have no practical knowledge of it. It is a good honey plant. 2. This is Gerardia purpurea, var. fasciculata.

E. S. B., Factory Point, Vt., says some of the magnolias sent him last year by the RURAL have come up, and he asks how to treat them during the coming Winter.

ANS.—We do not think they will require any special care if growing in well-drained soil. A slight mulch of straw, salt hay or something of the kind may prove serviceable.

F. K. M., Pingree Grove, Ill., asks how to save the seeds of the Red Hawthorne, and when to plant them.

ANS.—It is best to gather the seed as soon as ripe; place them in sand in a box and bury the box, planting the seed as early as may be next Spring.

D. W. S., Bayard, Ohio, asks, 1, where can Fife wheat be had; 2, will a low, mucky piece of land suit wheat.

ANS.—1, We should think the Cincinnati seedsmen could furnish it. 2, No. Better not sow wheat there at all.

H. C. K., Blodgett, N. Y., says he wishes to sow sorghum next year, and wants to know where he can get the seed.

ANS.—We have little doubt that all progressive seedsmen will have it for sale.

J. H. M., Nebraska City, Neb., asks what will a dozen Bidwell Strawberries cost him by mail.

ANS.—Layer plants, 75 cents.

M. V. R., Charleston, Mo.—We cannot name this wheat. It has been sent to us under many different names. The Velvet Chaff, as generally known, is a heavily bearded variety.

H. M. Priest, Steuben, Ohio, asks for information about land in Jennings and Pulaski Counties, Indiana, with a view to settling in the more eligible of the two counties.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, SEPT. 24, 1881.

DURING several days past we have planted 11,200 grains of wheat. The land was marked both ways nine inches apart, and a single grain placed two inches deep in the intersections.

THE Inter-Ocean, Detroit Free Press, and New York World are the only papers with which we club for 1881-2. The prices of these clubbing combinations are as low as they can possibly be made, and the postage of the free-seed distribution is included. We promise to give our prompt attention to subscriptions for any one or more of the above journals in connection with the RURAL NEW-YORKER, and have made ample provisions for doing so.

THE RAILROAD WAR.—The strife of the great lines to the West is getting warmer and warmer. Mr. Vanderbilt is found to be a "hard man to beat," his latest statement being that he is prepared to sacrifice $10,000,000 in support of his position. The reason for this is said to be his desire to "choke off" financial aid for the New York, Chicago and St. Louis road which is being built in close proximity to the New York Central and Lake Shore, whose securities are now on the market. It is a "scare-'em-out" policy, in other words. It is thought the war will last until after the close of navigation on the lakes: at any rate, there are no signs of peace as yet. In the meanwhile business men and tourists will continue to enjoy this era of low rates without a murmur.

AN OLD STORY.—Yes, its an old story; but some good farmers seem to have never heard it! If your machinery looks old, rusty and out of order when harvest comes, it is a pretty sure sign that it has been exposed to the elements too much, and that, instead of caring for it, the "hired man" left it where last used, and there the sunshine, rain and, possibly, snow have worked a "marvelous change" in its appearance. A thrifty farmer gives his farm implements good care, and is well paid therefor. We have now in mind a man who bought a mowing machine in 1862, and has used it until this season to do the mowing on a farm of about 100 acres, which has been largely devoted to grass, but that machine was stowed in the implement shed as soon as haying was done each year; Farmers, it pays!

TO BUTTER from cream, "butter" from caul fat, and "butter" from lard, must now be added "butter" from cotton-seed oil. Very appropriately the manufacture of this new product has hitherto been confined to New Orleans, where the small amount of home-made butter is so wretched in color, consistency and flavor, that bogus "butter" that cannot excel it must be abominable stuff indeed. Like all other well-wishers of the South, we are strong advocates of home manufactures there, but this advocacy certainly does not extend to the production of bogus "butter." Cow butter, bullock butter, hog butter and vegetable butter—surely every palate and pocket should now be suited in the way of butter. The new product boasts of being higher in quality than genuine butter, and lower in price than any of the other spurious concoctions.

THE eighteenth session of the American Pomological Society was held at Boston, Mass., on September 14th, 15th and 16th, under the presidency of Marshall P. Wilder, the venerable President of the Society. For more than thirty years he has been elected to this position, and there is not to-day on this continent or elsewhere a name more honored among pomologists, or a man who by earnest effort for a life-time has done so much to advance the art to its present high position in this country and to open the way for its further development. At the age of four-score and three his address was full of congratulation for past achievements, and of hope and encouragement for still brighter successes in the future. Long may he live to see his prediction fulfilled, and to spare to his thousands of friends, all the world over, the sorrow that must await upon the departure of so great a benefactor to his race, however full of years and honors his life may have been. We shall present a full report of the proceedings of the meeting at an early date.

THE MICHIGAN DISTRESS.—Later accounts from the burnt districts of Michigan only increase the extent and appalling nature of the calamity. Fresh discoveries of the corpses of victims are daily occuring; hundreds of the survivors wander miserably about, or writhe groaning in temporary hospitals scorched, wounded, blinded or crazed. The suffering and devastation are widespread and terrible. At a low estimate 12,000 people have been rendered homeless, foodless, penniless by the disaster—and Winter, a long, bleak Michigan Winter, will soon add to their sufferings. Among the black, smouldering desolation of a lately cheerful country, the voice of mourning everywhere arises for fathers, mothers, children, husbands, wives and relatives lost in the whirlwind of smoke and flame. Governor Jerome of Michigan has appealed to the generosity of the other States to co-operate in relieving the dire distress which is too great for his own State to meet alone. As usual, this city heads the long list of towns that have grandly responded to his appeal, having already contributed nearly $45,000 for the relief of the afflicted. Other places, notably Boston, Philadelphia, Chicago, and St. Louis, are nobly emulating the liberality of New York. Shall the country, the rural districts, alone remain hard-hearted in the presence of such suffering and tight-fisted before such generosity? Out upon so base a supposition!

THE SOUTH AND THE ATLANTA SHOW.

APART from Texas, the Southern States have hitherto benefited very little from the mighty stream of immigration pouring into the country, scarcely a tiny rill having meandered from it in that direction. Many of the new-comers have doubtless been deterred from going to that section through dislike to come into competition with negro labor; but the great majority of those who might otherwise settle there are kept away through ignorance of its many great advantages in the way of climate, soil, mineral riches, and varied natural and artificial products. Many, also, having heard of the unwholesome climate of the region exposed to the visits of yellow fever, confound this limited, low-lying area with the vast upland South, in which the climate is as wholesome as that in any other part of the country. The attention drawn to that section by the International Atlanta Exposition, affords a fine opportunity for laying before the world the great resources of the country, the genial character of its climate, and the wide field there offered for the profitable investment of labor and capital. In most of the Southern States vast tracts of fertile land suitable for every form of agricultural industry, can be purchased at low prices. The Southern railroad system has, of late years, been greatly improved and extended, thus affording ready communication with the world, and prompt transportation to profitable domestic and foreign markets. The prejudices born of the war and of slavery, the incitement to it, are fast dying out, and a judicious show of its resources and advantages at this season would be very likely to attract to it a fair share of the labor and capital now seeking an opening in other parts of the country.

FRENCH IMPORT DUTIES.

GREATLY to the dislike of French manufacturers, and, indeed, of a majority of the French people, Napoleon the III. at the hight of his fame formed a free-trade treaty with Great Britain, in 1860; but as Gladstone said in 1866, there was not a man that breathed on the earth who could have effected such a measure except Richard Cobden, the apostle of Free Trade, and the negotiator of the treaty. Cobden in the flush of his popularity "joined the majority" in 1865, and Napolean, shorn of fame and empire, followed him, in 1873, having lived to see his free-trade policy abandoned by Republican France, in 1872, when a mild protective policy was adopted in its place. Since then public opinion in France has become still more outspoken in favor of heavier duties on importations of most foreign products, and in obedience to its dominant demands, a stronger protective tariff has just been adopted. In American weights and money, the following are the duties imposed by the new tariff on the principal live stock and agricultural products imported into France from this country, and the same duties are applicable to other countries also:—

OXEN, $2.90 per head, instead of 72c. under the tariff of 1872; cows, $1,55 each, instead of 24c.; fresh butchers' meat pays a new duty of 25c. per cwt., and the duties on preserved meats and "extracts" are also raised. The duties on the various sorts of cheese are doubled, and a new duty of $1.25 per cwt. is imposed on fresh butter, and that on salt butter, too, has been increased. The duty on hops has been raised from $1.21 to $1.50 per cwt. The small duties of six cents per cwt. on wheat, and twelve cents per cwt. on flour, remain unaltered, while other cereals are free. Wool, skins and horse-hair are also free, and a small reduction has been made in the duty on horses, and a large one on mules. There also are a number of other agricultural products the duties on which have been altered; but as we export little or none at all of any of them, the tariff on them can be of no importance to American farmers.

A PROPOSED WESTERN EMBARGO ON EASTERN CATTLE.

THE Treasury Cattle Commission, in an official communication to Gov. Cullum of Ill., calls attention to the great danger, directly to the cattle interests of that State and the West generally and indirectly to those of the whole country, by the westward transportation of calves from the Eastern States some parts of which are now infected with contagious pleuro-pneumonia. It seems that Eastern calves to the value of $1,500,000 have been sold in the Chicago stock-yard, in the last fifteen months, and that although the trade is almost entirely confined to the Fall months, 7,000 head have been there disposed of the present season. Large numbers are also sold in East St. Louis, and considerable numbers elsewhere in the West. A very large proportion of these consist of pure-bred stock which are scattered among breeders and farmers throughout Ohio, Indiana, Illinois, Minnesota, Iowa, Missouri, Kansas, and Nebraska, thus endangering the herds of all these States. They are largely purchased by thrifty, poor persons who have often to mortgage them to secure the purchase money, and therefore shrink from promptly reporting the disease should it be developed, thus concealing its existence until it has obtained a dangerous foothold. Accordingly the Commissioners strongly urge the Governor to prohibit at once the importation of all cattle from New York, New Jersey, Pennsylvania, Maryland, Delaware, and Virginia, or "if it can be legally done," from "so much of these States as lies east of the Alleghany Mountains." In order to prevent the hardship that would be caused by interference with the sale of calves of Eastern pure-bred herds, it is proposed that cattle from infected States may be admitted on the certificate of the State Veterinarian that the herd and district from which they came, have been free from contagious pleuro-pneumonia for at least the last six months. Governor Cullum has the subject under consideration, and it is to be hoped he will investigate the matter thoroughly before adopting a measure of so much importance. The great risk to the public interests from a Special Commission lies in the fact that it feels bound to justify its existence by exaggerating the danger it was appointed to investigate. All reports of past investigations of pleuro-pneumonia in the above infected States go to prove that when most prevalent it was confined to very limited districts; that its area has been greatly restricted, and that it has not been nearly so contagious as the European type. While very anxious—as our record amply demonstrates—that all needed measures should be taken to prevent danger from this fatal disease to the vast herds of the West; it seems to us that the proposed measure is a trifle two sweeping in its nature. Before the appointment of the Commission we would have made no objection to its adoption; but we had hopes that the investigations of this body would have discovered some less sweeping means of effecting the object.

BREVITIES.

DR. LAWES'S article on the first page will bear reading at least twice over.

THE Cuban Queen watermelon succeeds well with us and is, the present season, of excellent quality.

AN interesting article on "Tree Trunks as Water-conductors," by Professor Storer, will be found on page 662.

PROFESSOR I. P. ROBERTS'S article discusses a device that saves a great deal of labor and half the expense of hauling fodder corn from the field to the silo.

IT has been nearly 10 weeks since rain has fallen at the Rural Grounds, though showers have occurred here and there within a few miles.

THE grape crop this year promises to be an unusually good one. Along the Hudson thousands of tons will be marketed, a very large proportion of which will be taken from Concord vines. The reports from other grape-growing sections are also very favorable.

ELPHICK sold Barnes, in England, a horse on trial of eight days; the animal died within that time through no fault of either party and the seller sued for the price agreed on; but the Court of Queen's Bench decided that the plaintiff could not recover, since the sale was conditional not absolute. English legal precedents are good here.

THE Cincinnati Chamber of Commerce has agreed that henceforth a car-load of grain shall be 28,000 pounds in all sales made for future delivery, unless otherwise stated. Thus if a sale is made of a "car-load" to arrive, it shall mean 28,000 pounds; any excess or deficiency must be settled at the market price ruling on the day, not of sale, but of delivery.

IN the case of the Georgia Railroad Company *vs* Beatie, the Supreme Court of Georgia has decided that for a consideration a railroad company can make a contract with a shipper of live stock whereby it shall be released from all liability for damages to stock, not resulting from mismanagement in the running of the trains, such as for over-loading, suffocation, heat, etc.

MONS. LEON CHOTTEAU, the French free trade missionary, has just returned to his native land from his abortive proselyting tour through this country. How little do we hear now, or have we since heard, of those enormously wealthy French commercial and transportation companies that were to do such heavy business in our agricultural products, and about which M. Chotteau bragged so loudly on his arrival among us on his recent visit! According to cablegrams of the 15th, he is now "demanding" from the French Government the abrogation of its February decree against the importation of American hog products, and proposes to organize public meetings in favor of the repeal of the decree. We heartily wish him better luck in his present wise efforts than he met in his late "otherwise" one.

THREE HUNDRED TONS of human bones, many of them complete limbs, and the hair still attached to some of the skulls, were landed during the past week at Bristol, England, to the order of a local firm for the manufacture of ground bone and superphosphate for agricultural use. They were shipped from Constantinople, and are supposed to belong principally to the heroes who fell at Plevna during the Turko-Russian war. The venerable Peter Cooper, who is as famous among farmers for his fertilizers as he is among cabinet-makers for his glue, and among the general public for his philanthropy and India-rubber cushion, says that human bones are often made into manure when they can be obtained quietly and abundantly, and that they make a strictly first-class fertilizer. After all, since the bodies have furnished food for worms, why shouldn't the bones furnish food for —— Man? No—plants.

THE time appointed for receiving applications for space in the Atlanta Cotton Exhibition expired on Saturday, the 10th inst. The Director-General announces that since then he has been overwhelmed by letters and telegrams asking for room, but he has been compelled to refuse all such requests. To afford space enough for all the applications already accepted will require several acres more of floor room than the capacity of the buildings already erected, and accordingly to supply ample space, several annexes are being built. As the Exhibition will open on October 5, and all exhibits should then be arranged in order, expedition seems necessary to secure a creditable display on the opening day. During October, November and December excursion railroad tickets to the Exhibition will be sold from this city for $36, good to return within 30 days from the date of purchase.

THE California Wheat Growers' Association met at San Francisco on the 14th and resolved to hold wheat for two cents a pound, or $2 per cental. On the Pacific Coast grain is sold by the cental of 100 pounds as it is here by the bushel. The Association estimates the exportable surplus of the State at 950,000 tons or nearly 30,000,000 bushels, exclusive of the quantity on shipboard in the harbor. Grain dealers think this estimate too low. They say the season's wheat surplus approximates 640,000 tons. Just 622,124 tons of old wheat were on hand July 1; since then there have been exported 183,911 tons, leaving a balance for shipment of 1,078,302 tons or 34,783,935 bushels. Thus it will be seen there is a difference of about four-and-three-quarter million bushels between the dealers' and the farmers' estimates—a mere bagatelle when it is considered that it is to the interest of the former to exaggerate the stock in order to cheapen the product, and that of the latter to belittle the amount in order to raise the price.

DRESSED beef lately transported in a Tiffany refrigerator car from Chicago to Boston in six days, arrived in as fresh and bright a condition as if bought at the neighboring slaughter houses at Brighton. The meat was shipped when the outside temperature was 80°, while that inside the car ranged during the journey from 42° to 44°. A large proportion of the meat used in the East is obtained from Western stock, and if the meat killed at Chicago or St. Louis can be brought to the seaboard in prime condition, just as good as that killed here, the price of meat here must be lowered, as the freight on it must be considerably less than on live cattle. As meat is taken from here to Great Britain in excellent order after 10 to 12 days, why cannot it be brought hither from the West in a condition equally good in half that time? The low prices would be a boon to consumers; but stock owners could hardly consider them an unmixed blessing.

Societies, &c.

THE PENNSYLVANIA STATE FAIR.

[Rural Special Report.]

PITTSBURGH, Sept. 12.

THE 28th annual fair of the Pennsylvania State Agricultural Society opened here on September 5, to continue two weeks. It is held in connection with the Pittsburgh Exhibition, a circumstance that detracts very much from its value; for the agricultural part of the show is very much too widely scattered for the convenience of visitors, the proper display of the exhibits, and reasonable welfare of the exhibitors. Here as in other cases in which agricultural fairs are held in large cities in conjunction with other exhibitions, the interests of the country are sacrificed to those of the city and all the best efforts of the managers are concentrated upon attracting large crowds of city folks.

The live stock show is outside the exhibition building. In the cattle department are 142 entries of the various pure breeds, including 48 of Short-horns; 27 of Jerseys; 26 of Ayrshires; 22 of Devons, and 19 of Holsteins. While the number of animals on exhibition is not very large, they make up in quality what is lacking in quantity. Herd premiums have been carried off as follows: Short-horns.—1st, Jas. R. Anderson, Ohio; 2nd, David Selser, Ohio. Devons—1st, J. M. Miller, Washington Co., Pa.; 2nd, J. B. Longnecker, Dauphin Co., Pa. Holsteins—1st, D. D. Tracy, Erie Co., Pa.; 2nd, J. L. Henderson, Washington Co., Pa. Ayrshires—1st, Wm. Fairweather. Jerseys—1st, C. P. Marcle & Son, Pa.

Of sheep, 224 are exhibited, principally Cotswolds, Black Top and Spanish Merinos, South Downs and Oxford Downs. The largest exhibitors are the following—all Pennsylvanians: Edward Hicks, Goshenville; J. R. Anderson and Berry & Son, Houstonville; John M. Miller, Hickory; G. J. Haggerty & Son and T. P. Dickson, Mercer Co. J. M. Miller has carried off the sweepstake premium on Merinos; G. J. Haggerty & Son that on South Downs. The Cotswolds had not been judged when I left.

The swine show is small, the white breeds making the largest display. E. B. Ashbridge carried off the herd prize on Chester Whites, and A. E. Slaughter on Poland-Chinas. W. H. Cole, of Clinton, N. J., exhibited a fine herd of Small Yorkshires. There are only a few Berkshires and Jersey Reds and no Essex.

The horse show is about an average, 153 being on exhibition. Of these 38 are Clydesdales. Messrs. Powell Bros. were expected to send down some fine specimens of this breed, but up to the time of my leaving they had not arrived. Presumably they were not ent on account of the heat, for stock here, as Cleveland, have suffered severely from the tense warmth.

The Dairy show, like that of fruits and vegetables, I found, after many inquiries, stowed away in a corner of the second story of the building, where not more than one in ten who wanted to see it could find it. There is, however, a very creditable display—a fine lot of home and factory made cheese and dairy and creamery butter.

The agricultural implements, if they were grouped together, would have made a very handsome display, but some of them are with the live stock outside the building, and the others are scattered all through the show. This makes exhibitors complain, as they much prefer to have their exhibits grouped together, especially at a fair where they give premiums on so many different varieties of agricultural implements.

The attendance of farmers and their families up to the present time, Sept. 12, has been very meager, plainly showing that the holding of an agricultural fair during two weeks does not meet with favor either from the exhibitors or visitors. Farmers do not know when to attend, and their visit is put off from day to day, so that they generally fail to come at all. Then again, exhibitors have to stay with their goods for two weeks at a heavy expense for help and hotel bills, and when for a whole week the entire attendance of farmers would not fill one car, they begin to get disgusted with the management. It is all well enough for the societies to get into the large cities and make money out of the city patronage, but this does not pay the stock, implement and other exhibitors who go to a great expense to attend these fairs and make fine shows especially for the examination of the agricultural community, who fail to come. Farmers, too, do not like to find the agricultural part of the fair, which they have come a great distance to see, so scattered that they do not have the time to hunt up the points of interest. The weather has been intensely warm, which may have had something to do with the attendance, the thermometer having gone over 95° every day since the fair was opened.

The machines that could get into Power Hall are shown in full operation, self-binders as usual attracting the most attention. There is a full exhibition of grain drills and mowers and reapers; but very few plows. Thrashers and portable engines are shown outside on the grounds, as are portable saw-mills, sulky cultivators, two-horse corn-planters, etc. A large number of Western manufacturers had their machines on exhibition, but up to Saturday, the 10th, exhibitors had either got disgusted with the weather or the lack of attendance, and this part of the exhibition presented a very dead appearance.

A new sulky harrow, exhibited by the Reiner Harrow Co., Line Lexington, Montgomery Co., Pa., attracted a great deal of attention. It is a combination machine, and in addition to a sulky harrow, it can, with its attachments, be used as a cultivator, corn marker and broadcast seeder. The harrow is adjustable, and has a reversible tooth that makes it either a scratching or a smoothing harrow at will; or, by attaching a cultivator tooth, it makes a complete cultivator. It folds up for transportation and has an automatic lift to chain it without the driver leaving his seat. I cannot here give as full a description of this new implement as it deserves, but it will be illustrated in the RURAL during the coming Winter, when its points will be enumerated. Farmers should look into its merits, as it will prove a great labor-saving implement. It is compact, simple, and its construction insures durability and freedom from outlay for repairs.

Messrs. Nash Bros., Harrisburg, Pa., and 22 College Place, New York, exhibit a full line of their Acme Harrows, including pony, two, three and four-horse harrows. The four-horse harrow cuts 12 feet and is two complete 6-foot harrows, that can be taken apart and used separately. Implements of this sort are made to meet the demand for these harrows on the large Western farms. It is well known that thorough pulverization pays, and without doubt the Acme will pay for itself on any ten-acre field. There is one in use on the RURAL farm and the RURAL can highly recommend it.

W. H. K.

THE NEW YORK STATE FAIR.

ELMIRA, N. Y., SEPT. 16-17-1881.

[Rural Special Report.]

THE 42nd annual meeting of the New York State Agricultural Society was held upon the grounds of the Society at Elmira, N. Y., commencing Sept. 13.

The attendance throughout was unusually large, and the receipts far in excess of those of former years. Wednesday and Thursday were the days of largest attendance; the receipts for admission on the former were upwards of $5,000, and on the latter day the gate receipts ran up to over $7,000. It was estimated that at least 20,000 people were on the grounds on Thursday. The efficient officers of the Society, however, with their many years of experience, were fully equal to the work imposed upon them, and everything moved off as smoothly as it would if the crowd had not been over half as large.

The grounds of the Society are situated about 2½ miles from Elmira, and are accessible by steam and street cars. They are well laid out with ample and commodious buildings, well adapted to the wants of the Society.

Entering them by the south entrance, the tent of the RURAL NEW-YORKER is situated immediately in front of the officers' headquarters, in "Newspaper Row," and beyond this is the beginning of one of the largest and most varied displays of agricultural implements ever seen at a N. Y. State Fair, occupying, as they do, fully six acres.

Dairy Hall, situated to the right of the south entrance, is well filled with dairy implements, cereals and vegetables. We noticed a barrel of Mold's Ennobled Oats and also the Washington Oats, both of which were first popularized by the RURAL NEW-YORKER, and each weighed 40 pounds to the bushel; both received first premiums. Here, too, was a new variety of wheat originated by Mr. Heiges of York, Pa., and mentioned more than once in the RURAL Wheat Special. Fifty-eight quarts of this wheat drilled Sept. 3, 1880, upon 1.9 acre of ground, yielded 79 bushels of grain, or at the rate of 41.58 bushels per acre.

Machinery Hall, just north of Dairy Hall, is not perhaps so full as in former years; but altogether it presents a fine display of implements. The Husbandman of Elmira has its headquarters in this hall, and the managers of this right-worthy journal, with their accustomed enterprise, are issuing a daily during the fair, and making a free distribution of it upon the grounds.

Passing on to the Stove Department, a building set apart for this purpose solely, one is almost bewildered by the variety and magnificence of the display. It would seem that the stove manufacturers had sent their entire stock for exhibition.

A large tent is set apart for the Floral display and here the lovers of floriculture are treated to a fine and varied exhibition of cut flowers. Noticeable among the exhibitors was James Vick, of Rochester, N. Y., to whom was awarded first premium on all his exhibits. His collection of gladioli, dahlias, verbenas, asters, phloxes, etc., was fine and was attractively displayed. The exhibits of Mr. Rawson and Mrs. Wells, of Elmira, were also excellent, and each has shown much interest in making the Floral Hall a success.

The display of fruit was not equal to that of former years, either in quality or quantity, owing, of course, to the scarcity of fruit throughout the State. The most prominent display was made by Ellwanger & Barry, of Rochester, N. Y. Their collections of 100 varieties of pears, 30 of plums, 30 of peaches and 36 of grapes was extra-fine for this season's growth. John Van Doran of Ithica, N. Y., was given first premium for the best collection of apples. Some very fine specimens of foreign grapes grown under glass, were shown by Gen. Diven of Elmira, N. Y.

The Poultry Department, as usual, was well filled, with birds of pure and well-bred varieties. Light and Dark Brahmas; Buff, Lemon, or Cinnamon Cochins; Partridge or Grouse Cochins; Dorkings, Dominiques, Plymouth Rocks, Hamburghs, Leghorns, Houdans, Bantams, Toulouse Geese, Rouen, Cayuga, Muscovy and Pekin Ducks, were among the most noticeable breeds. This department also had in full operation an incubator made by the Perfect Hatcher Co., of Elmira. We shall in a few weeks speak more definitely of this and illustrate the hatcher in full.

The cattle show was particularly fine and large, containing 342 entries. For the Short-horns Benjamin Fellows carried off the herd prize with his bull Benjamin F. and cows Lily of the Valley, Niobe 1st, Niobe 2d, Niobe 3d, and heifer Una. The show of this breed was not as large as usual, Wm. S. Moore, G. H. Bell and B. Fellows being the principal exhibitors. The show of Devons was very fine. Wm. H. Jones carried off the herd prize with his bull Prince of Wales, and cows Pet, Pride 3d, Rose of May, Pauline, and heifer Leva. Several very fine Devon herds were shown, and the exhibit in this class was specially noticeable. For Herefords, Erastus Corning carried off the herd premium with his bull Comus and cows Marchioness 2d, Victoria 6th, and heifers Edna and Echo. John Merryman, of Maryland, made a very fine exhibit in this class. For Ayrshires, Armiston Bros., of Cuba, N. Y., carried off the first premium with bull Joe Mars, and cows Bowment Maid, Duchess of Vineland, and heifers Clara B. Mars, Lady Bruce, and Princess 6th. There was a very fine exhibit in this class. In Holsteins Messrs. Smiths and Powell got the herd premium with their fine herd, consisting of the bull Uncle Tom and the cows Neilson, Ægis, Netherland Queen, Dutchess of Friesland and Topaz. We have illustrated several of this herd. Of Jerseys the show was particularly fine and large, and after quite a fight the herd prize was awarded to William Simpson. The question of "finishing up" cattle for the fairs was pretty thoroughly handled in this class and a number of protests filed against this award. In Guernseys, L. W. Ledyard, Cazenovia, N. Y., was awarded the herd premium for his fine herd consisting of the bull Fernwood and the cows Old Comfortable, Clementina, Elegante, Fernwood Fancy and Maiden Hair. We will illustrate some of this herd later in the season. G. F. Faber, Patterson, N. Y., exhibited part of his fine Polled Norfolk herd, and carried off all the premiums in that class.

The horse show was immense, and the draft and agricultural horses made a fine display. The Clydesdale, Brown Glancer, whose portrait appeared in our Fair Number, was exhibited by Messrs. Smiths and Powell, Syracuse, N. Y., and took the first stallion premium and also the grand stallion sweepstakes prize. This firm got over 20 first premiums.

Of all the attractions at the fair none was more eagerly and inquisitively examined into than were the ensilage cutters. The agitation that has been created and the articles that have appeared in this and other agricultural journals have aroused such an interest among farmers that any information or knowledge to be gained in the best and most useful appliances for filling silos, cutting ensilage etc., is largely sought for, and while a good ensilage cutter must, of necessity, be also a good fodder cutter, of course nearly every one is more or less interested in this class of machinery The crowd that was constantly gathered in front of the Belle City feed-cutter, manufactured by David Lawton, of Racine, Wis., and exhibited by A. M. Forrester, convinced the most skeptical that this machine possessed merits. This cutter is made with a carrier which elevates the ensilage or fodder to any desired hight and the workings of the cutter were both perfect and practical.

MESSRS DANIELS & Co., Odessa, N. Y. exhibited for the first time at this fair Daniels's plow sulky, and met with great success, taking the first premium in the plow trial that took place on the grounds Thursday. For 19 years Mr. Daniels has made a specialty of plow sulkies, and this, his latest invention, promises to give entire satisfaction.

JOHNSON, GERE & TRUMAN, Oswego, N. Y., exhibited their Champion Grain Drill with fertilizer, grass-seeder, hoe shifter, land measure and corn-planting attachments. The exhibit attracted a great deal of attention and many sales were made on the grounds. This drill has a special corn-planting wheel by which corn can be drilled, single kernels being dropped at equal distances, and fertilizers applied in the row.

THE KEMP & BURPEE Manufacturing Co., Syracuse, N. Y., made a large exhibit of their Kemp Manure Spreaders, as improved for this season. We saw a large exhibit of this company at Cleveland, and there, as here, they showed their machine in full operation spreading manure on the grounds. The effect of making a practical exhibit in this way was shown in the sales made at the fairs, they having sold 22 on the grounds at Columbus, and 12 at Cleveland, and the prospects are that their sales will amount to more than that on these grounds. When a farmer can be shown just what a machine will do, and is allowed to work it himself in his own way, it does not take much talk to convince him, if the implement really has the merits the manufacturers claim for it, and the Kemp & Burpee Co., have taken advantage of this plan. One of the principal improvements made in the spreader this year is a changeable gear, changing the amount to be spread by simply unscrewing one nut, which can be done in a minute.

MESSRS. REYNOLDS & LANG, of Ithaca, N. Y., exhibited in working order one of their steam engines, which received the highest award of merit. The engine was of the most approved pattern, the wearing surfaces of which are made extra large; the main box is lined with the best Babbitt-metal; the cross-head boxes, crank pin boxes, and cross-head gibs are made of the best gun-metal and furnished with ready means of adjustment in case of wear. There is little waste of power by friction, etc., in running, and therefore it furnishes a large per cent. of available power. These engines have been upon the market for many years, and have invariably given very excellent satisfaction both to the purchasers and their customers. The reliability of the firm and their reputation for turning out first-class work, backed by thousands of testimonials of merit, are evidences that the award was not undeserved, for that the committee had not faithfully performed their duties.

A CHEAP, practical and durable potato-digger is something nearly every farmer in the country has been looking for for many years. Judging from the work done at the field trial on Thursday, it seems almost certain that the problem has been successfully solved by W. D. Robinson of Kanona, N. Y. His digger is the result of nine years of experiment and study by one of the most practical farmers in Steuben Co., and one of the largest growers of potatoes in the State. It has dug 150 bushels per hour. It was patented in August last, and the inventor expects to be able to supply the trade with diggers in any quantity desired, next year.

THE hay press exhibited by D. W. Seeley of Albany, N. Y., was shown in operation, and met with universal approval. For durability, efficient working qualities and construction, this press bids fair to take a first rank. It is made in sizes for one horse or more according to size and solidity of bale required, and it will bale everything "balable." The horse traversing a half circle in either direction, once, forces the piston to its extent of pressure and also withdraws it again, leaving the press open, so that the feeding is done while the horse is being turned, and thus no time is lost. The bales are tied while being forced through the press and this can be done without stopping, and either with or without slats. The machine throughout is a model of workmanship, and received in 1880 a certificate of highest merit. At the fair it received a like certificate of merit, and, in addition, a silver medal.

MESSRS. FOWLER & WOODWORTH, of Tanghannock Falls, N. Y., exhibited Fowler's Pitching Apparatus. This apparatus consists of a carrier, fork and pulleys so admirably arranged that it can be changed from one direction to another without climbing or removing bolts or keys. The working parts are positive in their operation; the stops are adjustable, and it is secured to rails without the use of bolt or screws. It has been in use for a number of years and thoroughly tested, and has never failed to give satisfaction. In fact, the proprietors, sufficiently confident of its merits, guarantee satisfaction to every purchaser.

J. WESTINGHOUSE & Co., Schenectady, N. Y., displayed a fine selection of thrashers

(Continued on page 660.)

Miscellaneous.

"HAWK-EYE HIVE."

Lucas County Agriculture; Thoroughbreds; Creameries; Coal Mines; County Fairs, etc.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

THE Hawk-Eye State, as a whole, has acquired the reputation of being a hive of workers, with a minimum of drones in all departments of its industry; and the traveler East or abroad, who hails from Iowa, feels a conscious pride in the recognition he receives as such. In many respects the State acknowledges no peer; in some it has equals; in few a superior; but none has made more rapid strides along the path of healthy, substantial prosperity, in which it is rapidly verifying the prediction of T. J. Potter, General Manager of the Chicago, Burlington and Quincy R. R., in saying; "The time is not far off when Iowa, with its rich soil, immense coal fields and the thrifty character of its people, will be capable of sustaining parallel lines of railway, twelve or fifteen miles apart, across the State. People do not yet comprehend the immense possibilities of this wonderful State."

Lucas County, situated in the second tier north of the Missouri State line, midway between the Mississippi and Missouri Rivers, with a population at the time of the last census, of 14,530 (now certainly over 16,000) possesses superior inducements to the home-seeker. It is a miniature hive in itself, where the diversity in the pursuits of life is so great as to furnish profitable employment to the farmer in all departments of agriculture, while the artisan, the professional man and the laboring man are all assured of satisfactory remuneration for their labor.

The soil is alluvial, deep, dark and fertile containing that modicum of sand which promotes rapid vegetation, resists drought, and yet provides good drainage without surface washing to any extent worthy of mention. There is some difference in the soil in the several townships in the county, which we have not space to mention in detail; but a letter addressed to any of the gentlemen we may happen to name will receive courteous attention, or we would venture to suggest specially, as well informed, the names of Dr. James D. Wright, agent at Chariton for the lands of the Chicago, Burlington and Quincy Railroad, or Colonel W. S. Dungan, attorney and member of the State Legislature, both old residents and reliable authorities.

All crops indigenous to this latitude do well here, and fruit-growing, both in orchards and vineyards, is successful, as it will be remembered that at the Centennial, Iowa presented 350 varieties, and received the first premium; yet the topography of this county—beautifully undulating; soil, as stated; amply supplied with timber not only for fuel, but for shade and shelter; with a healthful climate; pure water, and nutritious grazing—is peculiarly adapted to stock raising and dairy product, in which the profit, carefully estimated by competent, practical authority, is placed at an average of 25 per cent. per annum. To get this, let every farmer raise sufficient wheat, oats, etc., for the necessities of his family, just as he raises potatoes enough, making corn his principal grain crop, and devoting most of his land to pasture and meadow, condensing these into beef, pork, mutton, wool, butter and cheese for market. Thus will be insured to the producer the maximum of profit upon his investment and labor. To prove the truth of this, and the further fact that there is more money to be made from the best than from the poorer varieties and grades of either horses, cattle, sheep or hogs, we note our observations among several of the stock growers of the county, that the readers of the RURAL may the better appreciate what is being done here.

S. H. Mallory, President of the First National Bank at Chariton, has two large farms near the town, devoted almost exclusively to stock raising, having about 50 head of pure-bred Short-horns, with "Jacques 25,387"—a six-year-old-bull, large-boned and well developed, at the head of his herd; he by "Ben," and tracing back to "Louan Duchess" and "Duke of Moscow," a fine strain. Among his stock are also the Short-horn Lovely's Wiley, 27,136, a four-year-old, having four Duke crosses, a clear red; and Moses, a full-blood Jersey, three years old, a fine animal; and cows of the Wiley, Medora and Louan families. His grades are all high, and nice, large, thrifty animals. At one of these farms—the "Maple-wild Stock Farm"—he has also two full-blooded Clydesdale stallions, weighing respectively 1,600 and 1,750 pounds, both well-formed and active; also two very fine, highly-bred trotting stallions, Ben-Wade, a descendant of Rysdyk's Hambletonian, the sire of Dexter and St. Julien; and Lucknow Jr., grandson of Lakeland Abdallah, a full brother to Harold, the sire of Maud S. sold to W. H. Vanderbilt for $21,000.

D. Wormley, proprietor of the Chicago Burlington and Quincy Eating-house, mentioned elsewhere, has a farm of 200 acres near town, and is devoting his attention to thoroughbred Holsteins and grades from select crosses, believing them better, both for quantity and quality of milk, than other breeds, and equal for beef.

Robert Barnett, with a farm of 1,200 acres, has a herd of 125 Short-horn grades, which he is building up and strengthening for ultimate profits; he also turns off about 100 Berkshire and Poland-China hogs every year.

S. L. Bestow, on a farm of 160 acres, has about 60 head of three-quarter grades, with a fine pure-bred Short-horn bull at the head of his herd. His yearlings average 1,200 pounds and his two-year-olds, sold last season, averaged about 1,600 pounds.

Lewis Bonnett has a farm of 3,000 acres, with about 300 head of cattle grading in to improved stock of the Short-horn families; but his principal interest is his flock of 3,500 sheep. At the heads of his several fields he has American Merino, Cotswold and South Down bucks of the best blood in the respective breeds. He pronounces in favor of the finer wool sheep as the most profitable. He sheared this year some 500 quarter-blood Merino grades, which yielded an average of seven pounds to the fleece; 300 fourth-blood Cotswald grades, averaging six pounds; while his South Downs of the same grades averaged five pounds; but the latter were acknowledged to be the best mutton. He turns off 600 to 700 head yearly—this year probably 1,000. His average net per head is about $6. No foot-rot or scab has developed in his flocks.

Closely allied to the stock interest is that of The Creameries.

Of these we found: The Chariton Creamery owned by Marshall & Son, was established last June, with a capacity for making 1,500 pounds of butter daily, their present average being about 250 pounds; they work on the Fairlamb system, or cream-gathering plan, collecting the cream with six teams from some 500 cows, within a radius of 22 miles. They use the Davis & Fairlamb patent cans, and three other styles, and churn by steam power with a six-horse-power engine. They buy the cream of the farmers on the basis of the price of creamery butter in the market, from week to week; manufacture their own tubs of uniform size, each holding 45 pounds, and ship to Boston and Denver.

The Benton Creamery, Braden & Walton, proprietors, commenced business July 5, '81; capacity 2,000 pounds daily; present average, about 250 pounds; they too work on the same plan or system, but use Clark's Revolution Milk Pan for setting; gather cream from a radius of 26 miles, by six teams, from about 500 cows. They are now using horse-power for churning, but expect to put in a steam engine this Fall; they pack in the "Welsh" tub 56 pounds, uniform size, and ship to New York. This creamery is on the co-operative plan; they do not buy the cream of the farmers; but gather the cream, manufacture, pack and sell the butter, and turn over the proceeds to the farmers, retaining an agreed percentage per pound for these services.

Both creameries require the milk to be set 24 hours and skimmed sweet, and each has ample refrigerator and ice facilities. Mr. Marshall and Mr. Walton both told us that their best patrons and the most prosperous farmers were the readers of agricultural journals.

From Mr. W. B. Penick of the Chariton Bank, an extensive stock dealer, we learned that the average weight of beeves shipped from the county is 1,300 pounds for 2½-year-old steers, and 1,400 pounds for 3½-year-olds, and the prices for seven years past average, on foot, from 4c. to 4½c. per pound—this year 5½c. Hogs range at about the same figures, and from inquiry we learned that the First National and Chariton Banks paid out for stock dealers, last year, close to $1,000,000; and there are several other towns in the county. Will this suffice to verify the claim of Lucas County to be a profitable one in stock-raising.

The Lucas County Agricultural Society have their present grounds of 10 acres three-quarters of a mile west of Chariton. Their buildings are inadequate, as well as the grounds, and after this year they will hold their annual fairs on the new grounds belonging to the Lucas County Driving Park Association, half a mile Northwest from the depot, containing 59 acres, and possessing a decidedly better class of buildings; G. C. Boggs is president, and Captain A. U. McCormick, secretary, both of whom are laboring assiduously to insure a good exhibition this Fall; but the farmers of Lucas County should remember that it requires their individual and hearty co-operation to assure success.

Coal.

An important interest in this county and one upon which columns could be profitably used, had we the space, is the abundance of bituminous coal-beds which underlie its fertile soil. The White Breast Coal and Mining Company, with a capital stock of $150,000, own about 1,500 acres of land, have two shafts with ample ventilation, and extensive drives, amounting in the aggregate to several miles. They employ some 450 men, and after September 1 can produce about 1,400 tons daily. Their coal is shipped nearly 450 miles from the mines and retailed at $6.50 per ton as a maximum price. The Lucas Mine owned and operated by the Chariton Coal and Mining Company, Thomas A. Francis, Superintendent, has sunk a shaft 340 feet deep, and is driving entries preparatory to opening a main shaft—using the former as an air shaft. They will be ready for competing trade in 1882.

There is no county indebtedness, but a surplus of funds. The assessable real and personal property is nearly $4,000,000, upon about one-third valuation. The market facilities may be estimated from the statement that nine of the twelve townships in the county are traversed by the C. B. and Q. R. R.

Nearly 40,000 bushels is the estimated quantity of flax-seed for the crop of 1881 in this county, which item we mention in connection with the flax statistics we have previously contributed as showing the adaptability of the soil to flax culture.

CHARITON—the county seat, with a population at last census, of 2,020, amounting now probably to 2,300, has a pretty site being upon rolling ground, skirted with groves, dotted with farms, and beautified with lawns, trees, shrubbery and flowers. There are several brick buildings neat in architectural design, and others in progress of completion which are taking the places of "old-timers," as some of the antiquated frame structures are called.

There are two fine, substantial brick school buildings, an excellent system of graded schools with twelve to fifteen departments and teachers, and eight religious organizations and church edifices. There are also three newspapers: the Patriot, published both daily and weekly, nearly a quarter of a century in the service of City and County, is newsy, ably-edited, neat in its mechanical department, with liberal advertising patronage and large circulation. G. H. Ragsdale is the editor and proprietor; though the editorial mantle now rests upon the shoulders of J. H. Campbell, in the temporary absence of Mr. R. We are under many obligations to both these gentlemen for numerous courtesies. The Leader, by Best and Braumer, is democratic in politics, and though younger, is entitled to many of the encomiums bestowed on the former. The Times, by R. B. Cooley, "greenback" in its proclivities, is young but promising. In addition to these newspapers there is a well regulated public library stocked with choice books, magazines, and agricultural and political papers. The various civic societies. A. F. and A. M.; I. O. O. F.; K. P.; and V. A. S. have lodges well attended. A new building has been nearly completed for the two first-mentioned societies.

For public entertainments Mallory's Opera Hall is centrally located and convenient in its appointments. The city is creditably supplied with hotels. The Bates House is "up-town," a good brick structure, well managed by B. Anderson; and at the depot is the C., B. & Q. Depot Hotel, the largest, best and most convenient building of the kind between Chicago and Council Bluffs, 40x200 feet; two stories high, with a dining-room capacity for 200 guests, furnishing meals for four regular trains; D. Wormley, lessee.

The manufacturing interests, yet in their infancy, have the promise of prosperity with the future growth of the city. There are large elevators and lumber yards, well-stocked as well as assorted stores in different departments of trade. Tributary to the towns is a rich country, while the citizens are enterprising and energetic. A fire department and three good brass bands added to the interests above mentioned, contribute largely to the general attractions of this pretty place and its excellent reputation abroad. The Bankers' Life Association, which is acquiring extensive and popular recognition, had its inception in Chariton by E. A. Temple, cashier of the First National Bank.

LUCAS, with a population of about 1,200 and CLEVELAND one mile East, with 450, are about eight miles west of Chariton. RUSSEL'S seven miles east of Chariton, numbers some 450. All three are on the main line of the C. B. and Q. R. R. and have creditable religious, educational, social, and commercial advantages. All are growing rapidly from the same inherent sources already enumerated.

DURBY, with over 200 inhabitants, is some eleven miles southeast of Chariton, on a branch of the C. B. and Q. and possesses the same elements of thrift; moreover, they were boring and prospecting for coal at the time of our visit. The main business interests of the towns of Lucas and Cleveland, are, of course, largely connected with the immense coal traffic which gives employment to hundreds and thereby renders the business interests of the places unusually brisk. The gentlemen in trade are of the thorough-going class of Western merchants, and to a person seeking a home and employment this locality offers a desirable choice. R. Daily at Lucas, has kindly consented to reply to correspondence of the RURAL readers regarding local or general interests.

REMARKS ON THE WHEAT NUMBER

HENRY STEWART.

HUGH L. WYSOR, in his article on page 619, makes a mistake in his reference to smut in wheat. There is smut, Uredo segetum, and bunt, stinking smut, or Uredo fœtida. The former is the black or blasted ear in which no grain has been formed, but a black powder fills the place of the ear; while the latter consists of a black mess of spores which fills the chaff and replaces the grains (or some of them) while the ear retains its usual outward form. When these grains are burst, the black bunt has a stinking odor, whence its specific name. Whether it is a varying form or not of Uredo segetum, is not certain; the spores of both are similar in appearance, although differing in the fetid odor of the latter. Both of these uredos affect the plant before the ear emerges from the sheath, and have been found in the ovary before full inflorescence. There are other peculiarities common to each of these species, which would strengthen the suspicion that they are merely different developments of the same diseased condition. As regards the opinions of the intelligent farmer mentioned by Mr. Wysor, I have found these unsound grains pierced by the midge, and its larva present in them in the same ear in which sound grains have been pierced and infested with larvæ. The small insect (or worm or grub) lives equally well on sound and unsound grains and will eat out the heart of one as readily as that of the other and leave the husk empty, excepting as the pupa of the midge may occupy it. I have seen a dozen of these midge pupæ in one husk thus dried and otherwise empty.

This midge (Cecidomyia tritici) is the insect which Col. Curtis calls (by a lapsus linguæ, if I may be permitted to make such a bull) the weevil, in his communication page 621. The wheat weevil (Calandria granaria), and the wheat moth (Tinea granella) attack wheat only in the granary or barn and after harvest. Here the former, which is a beetle, punctures the grain and deposits an egg in it; the grub burrows into the kernel and eats out all but the husk, leaving this light and chaffy so that at thrashing it is blown out from the fanning mill, along with the shriveled grain blasted by the midge. The latter (Tinea granella) lays its eggs on the grain, and the larvæ eat out the heart, and when hungry for more, attack an adjoining grain and cover it, with the first, by a fine web, thus connecting several grains or husks together. These are also blown out of the fanning mill as are the others. When in Central New York about 30 years ago, at the time when wheat growing was abandoned on account of the Hessian fly and the midge, I saw myriads of the midge pupæ gathered from the screenings of wheat and burned, and the farmers called them weevils. From the similarity of the habits of these grain-eating insects and their presence in the grain, this confusion of name was by no means surprising, and at that time, too, very little was popularly known about them anyhow. Col. Curtis refers to the coarse-chaff wheat being free from attack from weevils (midges). The midge cannot penetrate a thick, hard chaff with her ovipositor, and therefore the soft, white wheats cannot be grown where these midges abound, but the harder amber and red wheats are saved by their thick chaff, and have been commonly known as "midge-proof." I have visited my wheat field at night years ago, with a lantern and have seen myriads of midges, very small orange-yellow flies, busy trying to lay eggs in the wheat, which, however, being a very midge-proof kind (Treadwell), was not injured in the least, although every chaff was marked with several small spots where the burglar had made attempt to penetrate.

Spanish Chestnuts.

In regard to the hardiness of the Spanish chestnut I have a bit of experience for the readers of the RURAL.

Nine years ago, Josiah Macy, Jr., Rye, Westchester Co., N. Y., presented me with some Spanish chestnuts grown on his farm, the seeds of which he had planted eight years before. These nuts were planted on various parts of Kirby Homestead, so as, if possible, to secure a favorable location in order that some of the trees might come to maturity. The nuts all grew, and none of the trees has ever been injured by the cold, although some of them stand in exposed places. When five years old, some of these, growing in a slaty, rough hillside without any cultivation, blossomed and bore burrs but no fruit. This year a number of them growing on different soils and places on the farm have fruited quite extensively, with large, plump burrs. This is in latitude 43° north, and I have full confidence that they will do well. The branches are allowed to grow out near the ground. The largest tree is 13½ inches in circumference and 14 feet high. F. D. CURTIS.

Literary.

THORNS AND ROSES.

(Continued from page 642.)

In the afternoon aunt and I went outside; Edith remained indoors, lest the sun should spoil her complexion. When I returned to her, books lay on the table, music on the floor; and as I entered, she threw aside some embroidery, declaring that she was bored to death—that she could discover nothing very original about me—and that she wished Brandon or Nevil would come.

"I shall go and see Brandon to-morrow. Really—I feel inclined for a battle with Nevil now; I wish he would come and give you a few of his airs and graces, or even Brandon would enliven us, for there's a decided want of something new here."

"There is a want of something new in your conversation," I returned; "couldn't you praise someone, or speak contentedly, just for a change?"

She stared at me as if astonished, though I did not know why, as I certainly thought she might act on my suggestion.

Neither Mr. Verner nor Brandon came; and aunt said that Brandon might not wish to disturb us, and might think himself rather in the way, so I determined to go and see him myself, exercising Diamond for the first time. Brandon was as a brother to me; at least he had been so in the past, and I did not think that his affection would have changed.

Edith came into my room that night to show me how long her hair was out of its plaits, and asked why on earth I sat staring out at the sky instead of going to bed. I could not have told why; I was musing on the past and present, and on the occurrences of the day: towards the future my waking thoughts had not traveled, yet my dreams were all of it, and it seemed full of pain, whilst I groped vainly in its shadows for my lost peace.

CHAPTER III.

Aunt Dorothy's china dusted, and the fresh flowers duly gathered, I gave directions for Diamond to be saddled and prepared for me, aunt giving me directions as to how I must go to Kingston, mingled with messages for Brandon, and cautions against losing myself. Having seen my gallant steed in readiness, I went in search of Edith, half hoping that she would accompany me; and found her in the summer-house, its seat converted into a sofa, her hat on the floor, her eyes closed as though in slumber.

"Art thou sleeping, maiden?" I asked.

"Whither away, cousin?" she said, merrily.

"I am going to see Brandon."

She opened her gray eyes to their utmost width, giving a faint, languid smile, as she said:

"Don't you think you might as well run on to Newville and see Mr. Verner?"

"Unfortunately, I do not know him."

"You are really going to Brandon?"

"Is it so very wonderful for me to visit my oldest friend—my almost brother—my kinsman?"

"If it were kinswoman, I would say nothing. No matter; you don't care for Madame Grundy."

"Certainly not. I was only trying to tease you, Kate. Remember me to Brandon, and tell him to come and see me."

"Will you not go with me?"

"No thanks! I went once, and by way of entertainment, Brandon brought me a lot of old relics to examine, until I felt bored to death."

"I suppose he did his best," I returned. "I am going now, unless you will change your mind."

"No: but I'll see you mount."

She drew her arm through mine, singing as we walked to my patient horse. She waved farewell laughing, whilst Black Diamond cantered away.

Drooping boughs of oak and chestnut touched me as I rode along the lane, to the intense admiration of the curly-headed urchins returning from school. Rising beside a stream was a black windmill, its huge arms motionless; the miller's cottage, with tall hollyhocks and lupins beside; and this being one of my landmarks, Diamond swept past, cleared the hedge in splendid style, and bounded over a breezy common as though he enjoyed the freshness of the air as much as I did. We cantered through a village street, and then, as we reached a white dusty high road, Diamond relapsed into his steady canter, and I caught a glimpse of the turrets of my brother's home. Very soon I had passed through the park, and drew rein as I reached the lodge and iron gates of the more private grounds.

A man came out to my assistance, and after glancing at the horse, remarked that I was Miss Lovel, for he knew Diamond, Mr. Brandon having broken him. Leaving Diamond, I went slowly towards the house, until among the trees I heard the sound of a voice. A clear tenor broke the silence, and I listened, motionless, whilst the unseen sang on:

"There was something the season wanted,
Though the ways and the woods were sweet—
The breath at your lips that panted,
The pulse of the grass at your feet."

Was it Brandon? My heart beat as I waited for the "singing pilgrim" to draw nearer.

"I waited to watch you linger
With foot drawn back from the dew——'"

There was the rustle of branches pushed aside by a strong arm, and the next moment I had clasped my old playmate's hands.

"Welcome home, dear sister!" he cried—"Welcome home at last! How glad I am to see my little companion of bygone days—my first friend!"

I turned aside, half crying, because I felt so happy that he was glad, and suspected there were tears in his eyes too.

Ah, me! no vision of how I should stand before him, a humbled, sorrowful woman, in these very woods, threw its shadow on me then! I was happy.

"You came to see me, Kate? That was kind; it was like you. Not the first time you have come to Kingston, and many a castle have we built together; but you are changed since then."

"Changed?" I repeated,

"Changed from the little one of my childhood. We all change with time, we parted children, and we meet—one a man, the other almost a woman."

There was a ring of sadness in his voice that in a moment recalled to me his neglected youth, his many trials, and his lonely life.

"Dear Brandon," I said, "whatever outward change has come, I am to you the old Kate. Could I forget you, brother? Does a sister's love fail?"

If there had been restraint on either side it has passed away now, and bygone days might have returned. We were yet lingering in the forest-shelter, and I looked at his face. What had I expected to see?—the child with whom I had played—or a bent, worn man? Edith's phrases had misled me, and I saw a Brandon I had not pictured. Grave and quiet he was indeed, and there was a strange shade of melancholy in his face; but there was power in the compressed lip, intellect in the lofty brow, truth and honor in the dark eyes; he was like a bygone Lovel, pictured at home, with his fine face, his clear-cut features and tall form. Of his character as a man I scarcely thought; for to me he was the Brandon of early days; he had, I knew, the pride that keeps us from speaking falsely or unkindly, from being mean or untrue—a different pride from that which we usually accept as such, and which is mere arrogance. Perhaps, looking on him by the warm light of old affection, I made him all too faultless; but I know as we stood together in the quiet forest, I believed that there were none on earth more noble than my brother Brandon.

"Shall we go to the house?" he said presently, and we left the woods, he holding aside stray branches for me to pass.

"How did you know where I was?" I asked, watching a broken blossom float down the tide as we paused on the bridge.

"I saw my friend Diamond, and knew you must have come. Something guided me to the forest; perhaps a bird to the right sang *Here*."

"And you had not forgotten me?"

"You left Aunt Dorothy well?" he asked, and then I was sorry I had asked him had he forgotten me.

"Yes, she is well. Edith arrived yesterday, and wants you to see her. Oh Brandon, how good you have been to Aunt Dorothy! She has told me of your kindness, and I know what you have been, and are, to her."

He looked at me wonderingly.

"Is it so much to visit one so kind and gentle? And you don't see the selfishness of it either!"

We had reached the house, and he opened one of the long windows, leading the way into a strange, quaint apartment, with oak ceiling and tapestried walls skins of animals, bronze statues, an inlaid table supporting a rapier and an ivory casket with jewelled clasps.

"This is my reception-room," said Brandon.

"Are you not very lonely?"

"Sometimes; but it can't be helped. I have no relations; and Aunt Dorothy has settled my future for me."

Thus lightly could he dismiss his own who pitied so deeply the loneliness of others.

"My other room is all books," he said, "and very few care to enter it; my old housekeeper shuns it, because of a skull I once showed her."

"And you like to live quite among books?"

"It runs in the family, Kate. There was a Brandon Lovel in the good old times, and I follow in his footsteps. But tell me about yourself." I spoke of my school-life, and he listened with a faint smile; of himself he said but little, and I could not speak of his father: it was a subject too painful, though I caught myself contrasting the revels of the past with the perfect repose of the present.

"You will come and see us, Brandon, and find out the pictures on the tiles for me!"

His whole face brightened, and he laughed.

"You remember even that? Oh! yes, I will come."

We walked out together, and Brandon assisted me to mount. I looked back just before the trees hid him from sight; he was standing where I had left him, a lonely figure, looking after me as I rode away.

On arriving home, I found Edith in very low spirits, and aunt was endeavoring to cheer her.

[To be continued]

A great many persons become insane from sleepless nights that Hop Bitters would have prevented.—*Adv.*

Domestic Economy

CONDUCTED BY EMILY MAPLE.

LITTLE HELPS.

MAY MAPLE.

Not long ago Mrs. M. Wager-Fisher recommended the assistance of men as hired help in the house—when it was inconvenient to find girls, or women to aid in the work of the household. This was a good suggestion, and works well in some localities. But I believe in most country places it would be quite as difficult to find men or boys to go into the house to earn a living as it would be to find capable girls. In fact, I think it would be easier to hire girls to go out upon the farm to plant corn, dig potatoes, etc.

Occasionly one will "come down" to the work if his wages are likely to be a little more than he can get at anything else, or a little more than double what girls would receive. But there is a certain class among farmers, at least, who have not yet reached the middle round of the ladder that leads to "comfortable circumstances," and these are scarcely able to hire a domestic, and yet they need some assistance.

"Oh!" says the young housekeeper, with little three-year-old hanging to her skirts and a baby of three or six months in her arms, "if I could only have some one to take some care of baby and amuse Madie, bring in wood, and an occasional pail of water, and feed the chickens"—for who ever saw a farm-house without its groups of chickens—"and do a hundred other little odds and ends of chores that do not amount to much taken singly, but when added to numerous other cares, become really burdensome." And the young farmer frequently feels that the barn chores are a heavy tax upon his strength when he has followed the plow or harrow from early morning till set of sun, but as yet he feels unable to pay a man $15 or $20 dollars a month and board; so he plods on as best he may.

Now in almost every State there is an orphans' asylum, and these houses or State public schools, as they are often called, are frequently filled with friendless children of both sexes whose ages range from infancy to fifteen or sixteen years. They are not children who have been sent to the institution for bad behavior, though we do not doubt there may be now and then one who has somewhat the disposition of a street Arab, but they are homeless and friendless, and need parental training, that they may make noble specimens of manhood and womanhood. Now, if these farmers, who are overtaxing their strength, both indoors and out, knowing their inability to hire, and having no children large enough to assist about the "chores," would each take one of the friendless ones into their family and patiently teach him or her what would be required from day to day, the burden would, much of it, slip from the shoulders of those so much overtaxed. And any healthy child of 12 or 13 years can earn its board and clothes and not be overworked either. And if the child is treated as a son or daughter, he or she will very soon take an interest in the work, that no hireling would ever think of doing. And very soon you will find your little assistant will grow into just the truly efficient help that you so much need. Let us help the helpless, and in so doing help ourselves.

ECHOES FROM EVERY-DAY HOUSE.

ANNIE L. JACK.

It is pleasant to read in the pages of the Rural such kind little words of encouragement as those given by "Olive." "Every-Day House" is a *real home*, where live a large and happy family, each busy with whatever his or her hands find to do. The boys help the girls in many a task that would be otherwise disagreeable, and the girls, in turn, help their brothers over many a rough place. It is a busy home, yet, withal, there is rest there, and among the trees and fruits and flowers of that quiet hillside, strangers, after a few days' visit, generally say: "How restful this home is!" To be busy and helpful is one of the greatest charms life can have, and yet how few understand it. I do not mean a life of drudgery, but of earnest work, varied by recreation that will keep the mind as well as the body employed.

Just now to the ruralist it is a time of comparative leisure, and let us hope that every reader will take advantage of the many excursions to visit, if but for a short time, other and new scenes. The contact with kindred spirits, the rubbing against each other, and the interchange of ideas are calculated to do good to all of us, and let the weary wife and mother leave her charge if but for a week—the work would go on, dear friend, if you were dead. Let the loved ones miss you for a few days while you see the beauties of Nature and of Art. We cannot all visit the Yosemite Valley, but we may see Niagara at little cost, and hear the wind and see the prospect from some mountain top. Or, if not, go to the nearest town, *not* on a shopping errand, but to see anything that has been collected for your instruction. Visit museum or art gallery, or attend some good concert or lecture. It will brighten your life, and be long remembered in your future.

DOMESTIC RECIPES.

PICKLED ONIONS.

Select the small white onions, remove with a knife all the outer skin so that each onion will be perfectly white and clean. Make a strong brine (one that will float an egg), put the onions in and let remain three days. Take out and cover with hot spiced vinegar.

WHIPPED-CREAM PIE.

Sweeten a teacupful of very thick, sweet cream and make as cold as possible without freezing. Line two small pie-tins with moderately rich crusts prick in several places to prevent blistering and bake in a quick oven. Flavor the cold cream and whip as you would eggs for frosting. When the crusts are cold, spread on the cream and if you like to add a finish, put bits of jelly on top.

FRICASSEED CHICKEN.

Cut up and put on to boil in a small quantity of water. Season with salt, pepper and an onion if liked. Stew very slowly until tender, then add a half pint of rich milk or cream and thicken with butter and flour rubbed together, add a little chopped parsley just before serving. Have toasted some thin slices of bread, arrange on a platter and pour over the chicken. LONG ISLAND.

WILD GRAPE JELLY.

In the matter of jelly the wild grape is to the housewife of the Western plains what the currant is to her sisters of the East. The jelly is nicest when about one-third of the grapes are still green. Put them, stems and all, into a preserving kettle and add sufficient water to cook soft, stirring occasionally. When done, strain and boil a few minutes or till the water is boiled out; then add sugar, a pound to a pint of the juice. If rightly done a few minutes will make it. MRS. A. E. S.

Preserving Blue Fish, etc., for Winter Use.

A friend calling upon us was asked his method of salting down fish, which he gave as follows: Know that your fish are just out of the water. Split open, remove entrails, and cut out the back-bone so that every particle of blood is soaked out in the brine. *Do not scale.* Put the fish into a weak brine and let stand over-night. In the morning pour off the water and cover with another brine. After a few hours take out the fish very carefully and lay on a board to drain—tipping up the board so that all of the brine runs off. Now put a layer of clean coarse salt in the bottom of the cask you are to pack the fish in, then a layer of fish, then one of salt, and so on, until all are in. The last layer should be salt. In a few days you will find the fish covered with a *clear* brine. Keep in a cool place. The fish must of course be kept under the brine. One essential thing is to handle the fish as little as possible from first to last.

QUESTIONS ANSWERED.

CHIPPED BEEF.

Please give directions for cooking chipped beef. S. G.

Ans.—The beef should be first covered with boiling water to freshen, then pour it off, frizzle in a spoonful or more of butter, dredge with a little flour, add new milk, from a half pint to a pint according to the quantity of beef, and simmer 10 minutes. Just before taking from the fire stir in the beaten yelk of an egg.

Paralytic, nervous, tremulous old ladies are made perfectly quiet and sprightly by using Hop Bitters, daily.—*Adv.*

(Continued from page 657.)

and engines that attracted a great deal of attention. Their new traction engine which they had in operation, with its guiding attachment, drew a large crowd of visitors, and met with universal commendation. This device is put on all their traction engines. In operation it is very simple and can be operated with ease. A reversible gear, worked by a reversing lever, enables the operator to turn the engine in either direction, or change its direction, making it run either forward or backward, as desired, and all is accomplished with ease and rapidity. The company has thoroughly tested the engine under all conditions, and is fully satisfied that it will meet the wants of all. The best workmanship is employed in its manufacture and it is put upon the market solely upon its merits.

ONE of the largest displays on the grounds was that made by Messrs. Gregg & Co., of Trumansburg, N. Y.: they exhibited their full line, including the Meadow King Mower, Osborne Plow Sulky, Gregg & Meadow King Sulky Rakes, and their new Gregg Self-delivery Reaper. At the great plow trial at the New England Fair at Worcester, Mass., last week, the Osborne Plow Sulky with the Gregg Chilled Plow attached, carried off the first premium after a stubborn contest with most of the principal sulky plows. The test was made thorough, and the committee put the plows to the hardest kind of work. The new Gregg Reaper promises to be a good addition to the line of goods sold by this company; it is an entirely new machine, and has already made a successful record. As soon as we can get cuts ready we will illustrate and describe it.

THE new model direct-draft Eureka Mower, manufactured by the Eureka Mower Company, of Towanda, Pa., attracted the attention of the farmers during the entire fair. The company showed a six-foot and an eight-foot cut mower, both of which were model machines. The demand for these mowers during the past season has been very great, and the company have been unable to supply their constantly increasing orders. With increased facilities for turning out their work they will be able to build at least 2,000 machines for next year's trade. Testimonials from leading farmers in all sections speak in the highest terms of the merits of this mower, in every instance entire satisfaction being expressed. The workmanship is of the best, the material used is first-class, and all machines are fully warranted.

THE St. Johnsville Agricultural Works, Mr. Williams proprietor, at Johnsville, N. Y., showed a full line of their tread powers and separators in operation. They have had a very successful year, and the machines on exhibition had to be made at the last moment for this purpose. They now have a full line of powers to suit all their different sizes of thrashers, from a one-horse tread to a ten or twelve-horse portable engine. To meet the growing demand in some sections for steam thrashers, Mr. Williams now supplies one of the best thrashing engines in the country with his largest-sized separator, and he will be fully prepared to supply all orders on short notice.

GEO. WHITBECK—headquarters Rochester, N. Y.—general agent for the Gale & Albion M'f'g Co., of Albion, Mich., made a fine display of Gale Chilled Plows and Albion Sulky Spring-tooth Harrows, with broadcast seeder attachment. The new series and styles of Gale Plows made a very handsome exhibit, and their fine polish and elegant finish showed that the best of metal and workmanship must have been used in their manufacture. The Albion Sulky Spring-tooth Harrow is comparatively a new machine; it created quite a sensation on the grounds. It has been thoroughly tested the past season and meets with general favor. It is a practical implement and sells at sight. We have one at the Rural Farm and will illustrate and describe it as soon as we have tested it.

THE WALTER A. WOOD Self-binding Harvester, the Dederick Hay Press, the Ross Giant Feed Cutter, the Bradley Mowers and Reapers, the Acme Harrow, Payne & Son's portable engine, Chandler & Taylor Mnlay Saw Mill and Farquhar Birdsell's engines and others were among the exhibits in the classes to which they belonged. The Reiner's combined harrow, cultivator and broadcast seeder is a new and meritorious implement. Plows were exhibited by the Clipper, Daniels, Ames Plow Co., N. Y. Plow Co., Wiard, Oliver, Gregg & Remington. Thrashers made by Williams & Co., the Victor, and Roberts, Throp & Co., of Three Rivers, Mich., made an excellent show. Grain drills were on exhibition made by the Empire Grain Drill Co., Farmers' Friend M'f'g Co., the Missouri, and Union, Hagerstown, Champion, etc. Short & Smith, Cortland Wagon Co., and Moyer, Fish Bros., Milburn Wagon Co., exhibited their wagons. Those of Davis and Auburn occupied a large space, and were of the most modern and stylish patterns.

The creameries made by M. D. Chapin, the Vermont Farm Machine Co., Moseley & Stoddard, Lincoln, Brown & Rosa, were very fine and attracted special attention.

Altogether this is one of the most successful fairs ever held in Elmira, and the Society feels under many obligations to the many exhibitors and visitors for the interest manifested in the success of the Fair G. B. B.

News of the Week.

HOME NEWS.

MONDAY, Sept. 19, 1881.

On Saturday the President had another relapse from which but a partial recovery has been made up to this writing. He was attacked with chills, his pulse rose to 137, there was much nausea and, a part of the time, the patient was delirious. There has been no real improvement in his condition since yesterday morning. Attorney Gen. MacVeagh, who has been with the President almost continually, summoned the cabinet last night for consultation with the doctors. The cabinet were informed that at no period has the President's case been so serious as now, and that if the surgeons cannot control the rigors (chills) his death will be a question of a very short time. Secretary Blaine has telegraphed that he will come at once. At midnight the febrile rise was reported to have subsided.

LATER.—9.15 A. M. The condition of the President remains unfavorable. At 8.30 this morning he had another rigor on account of which the usual dressing of the wound was postponed.

LATEST. 5:00 P. M.:—The President is growing weaker continually, and the most hopeful concede that his condition is critical in the extreme.

New York has contributed about $45,000 to the Michigan sufferers; Boston, with one-fourth the population has given $25,000 to the same fund; or more than half as much as New York. About the same proportionate amount was contributed to the sufferers from the Chicago fire in 1872. Comments are unnecessary!

A fire broke out in the Kansas City (Mo.) fair grounds, on the 14th, which did much damage. The main hall was the first to succumb, and a panic seized upon the people who were in it. Though the confusion was great, no loss of life was reported. The damage to buildings, etc., is laid at $50,000.

Ex-Governor Dingley, of Maine, has been elected to fill the vacancy in the House caused by Mr. Frye's elevation to the Senate. His majority was 5,173.

The balloon voyage which Prof. King and others were to make to the seaboard from St. Paul, Minnesota, has, like the balloon itself, collapsed. The several reporters for the press will now have to take their vacation on *terra firma*.

About 100 Chinamen of this city rejoiced in a clam-bake on Staten Island, Thursday. The "Heathen Chinee" is fast becoming civilized.

Mrs. Susan May Bonaparte, widow of the late Jerome Napoleon, died on the 15th inst., at Baltimore, Md.

The Rev. Dr. Darling began his work as president of Hamilton College, Clinton, N. Y., on the 15th inst.

Battery P, Third Artillery, by command of Major Gen. Hancock, marched from Fort Hamilton, New York Harbor, to Yorktown. The route of the "army" is via Trenton, Philadelphia, Baltimore, Washington, and as far as practicable it will follow the route taken by Washington in 1781.

Major Gen. McDowell reports that 11 officers and men were killed or died from their wounds at the recent fight with the Apaches in Arizona. Gen. Carr was not killed as first reported.

Secretaries Hunt and Windom, Postmaster-General James, and others of the Cabinet party who have been taking a trip to the White Mountains, returned to Long Branch Saturday, owing to the unfavorable condition of the President.

From the first to the middle of the present month 15,273 immigrants have been landed in this City, an increase of 2,122 over the number of arrivals during the same period in 1880.

Owing to the drought, in Ottawa, Canada, where the water works do not reach, water has been sold for a dollar a barrel. Twenty-five cents have been given for a pailful.

Forest and brush fires are raging in Marin County Cal., near the foot of Mount Samalpais. It is reported that houses, out-buildings, fences, etc., are being swept away. Dense clouds of smoke are hanging over San Francisco, driven across the bay by the north wind.

Gen. A. E. Burnside died suddenly on the 13th at his residence in Bristol, R. I. The immediate cause of his death was spasms of the heart. His funeral took place on the 16th at Providence.

Two agents, one from the Texas and the other from the New Mexico Railroad companies, have been in China contracting for labor on those roads, and the steamer Oceanic, which is due in ten days, will have a thousand coolies for them. These will receive $1.25 per day and transportation to the scene of their work.

Catering succeeded very well under the late Lorenzo Delmonico. His will disposes of property exceeding $2,000,000 in value. It divides the estate among relatives, with the exception of $5,000, which are given to the St. Vincent de Paul orphan asylum of New York.

The Selectmen of the town of Franconia, N. H., have officially rechristened the mountain which has heretofore been known as "Haystack Mountain" situated in that town, and it will hereafter be known as "Mount Garfield."

Commander K. Randolph Breese, of the United States navy, died at his residence in Newport, R. I., Tuesday, after a long illness. He commanded the marines in the attack on Fort Fisher.

It is alleged that Mr. Vanderbilt is willing to spend $10,000,000 to carry his point in the railroad fight in which he is now engaged. He is determined to choke off financial aid to parties desiring to build new trunk lines from the Atlantic coast westward.

Mrs. Hayes's portrait, presented by the women of the United States, cost $3,000. It was painted by Daniel Huntington, of New York.

Arresting the Progress of Consumption.

The action of "COMPOUND OXYGEN" in arresting the progress of pulmonary consumption has been so marked and constant in our administration of this new Treatment that we are warranted in saying that, if taken in the early stages, eight out of every ten persons affected with this disease might be cured. In this disease, as every one is aware, the only hope of the patient lies in the establishment of a higher vital condition. Now Compound Oxygen is an agent that gives directly this new and higher vitality. But we cannot too earnestly urge the necessity of using this Treatment in the very commencement of pulmonary trouble, and before the disease has made any serious inroads upon the system and reduced its power to contend with so dangerous an enemy. Too many of the cases which come to us are of long standing, and the chances for a radical and permanent cure just so far remote. That Compound Oxygen benefits, or cures, so large a proportion of these, is often as much a surprise to ourselves as to our patients. Our Treatise on Compound Oxygen, containing large reports of cases and full information sent free. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

Monday, Sept. 19.

The following agricultural items are condensed from telegrams received in this city from the various points from Friday afternoon, Sept. 16, to date:—Portland, Me.: crops of fruit and other produce find ready markets elsewhere: prices firm.....Boston, Mass.: Another very active week in wool; sales foot up 5,072,000 pounds, making nearly 11,000,000 pounds in two weeks. An advance of 1@1½c. per pound in fleeces. Hides dull. General tendency of prices in food products and raw materials is upward.....Providence, R. I. Cotton, middling uplands held at 12⅝c.: middling Gulfs, 12⅞c.: prices firmer.....Buffalo, N. Y.: Flour and wheat active and higher. Little doing in other grains. Lake and canal freights higher. Wheat to N. Y. 5c.; corn, 4½c.....Philadelphia, Pa.: Wool fairly active and very firm: a good many lots are held off the markets for an expected advance. Week's sales, 75,000 pounds. Cotton dull and weak. Dairy produce scarce and firm. Receipts of flour 1,000 to 1,500 barrels per day less than consumption. Grain opened strong and higher, but advance has been nearly within the last two days Storage question settled by resort to barges at old rates for first ten days, then at an advance of ¼c. per bushel for each succeeding ten..... Detroit, Mich. Dairy products firm and going up: choice packages scarce. Fruits not overabundant. Wheat accumulating, speculation obstructing logitimate business. Light stocks of flour.....Chicago, Ill: Inter-State Exposition and Chicago Fair attracting large crowds of farmers. Grain trade active; heaviest "deals" for October and November deliveries. Hot wheat being removed from warehouses and taken to millers. Heaviest "provision" trade is for January and February deliveries.....Peoria, Ill; Receipts of grain light; market strong.....

Cleveland, O. Great scarcity of potatoes at $1@1.10 per bushel by car-load on track. Wheat No. 2 red winter, $1.44.....Toledo O. Recent heavy rains have improved crop prospects. Prices of grain firm with an upward tendency.....Evansville, Ind. Heavy rains all over the country from Indianapolis, brightening crop prospects somewhat. Corn too much damaged to be much helped. Other uncut cereals and tobacco will be benefited .....Milwaukee Wis. Heavy rainfalls here and there have put a stop to thrashing and delivery of grain, and considerably damaged that not stacked. City mills running to their full capacity. Nothing special about grain.....St. Paul Minn. Rain still stops thrashing and keeps wheat back.....Minneapolis, Minn. Four clear days in two weeks: much rainfall. Considerable wheat not in stack, mainly of large farmers, all more or less damaged. Little thrashing done. Millers running short of dry milling grain. Grade will be reduced by rain with some loss in quantity. Crop of Minn., from 38,000,000 to 40,000,000 bushels. High river endangers 40,000,000 feet of logs.....Louisville, Ky. Good rains, apparently general ended two months' drought on Wednesday, and if too late to improve crops will put ground in good condition for planting.....St. Louis, Mo. Grain, provision and flour markets very excited; prices constantly changing. Sheep have been in fair supply; but are now held back to grow wool. Good steers held back for an advance, Canned fruits and vegetables very much higher..... Denver, Col. Fair week; town thronged. Fruit and vegetable market fair. Meats firm: supply of grain and flour small, trade brisk. .....San Francisco, Barley advanced the past week 5c@10 per cental. Wheat fell 2½c, but recovered. Buyers holding back..... Baltimore, Md. Prices for wheat and corn, spot and options, have advanced so surprisingly that export business is practically killed, as the figures here are higher than those in Europe. Ocean freights therefore demoralized and low. Feeling very bitter against Elevator Company. Oats quiet, rye dull but firm. Provisions unsettled but firm. Cotton heavy with a downward tendency.....Washington D. C. General E. A. Carman, Acting Com. of Agriculture, has directed 100 bushels of wheat and 50 of rye to be distributed for seeding purposes among the farmers of the Michigan fire-devastated districts—a drop in a bucket. In a bucket?—in a barrel.....Norfolk Va., cotton coming in at the rate of 2,000 bales a day.....Richmond, Va. Good rains. Tobacco men say the rains are so late they will do tobacco more harm than good, causing the leaf to "green" when nearly ready to cut. Tobacco market decidedly firm; prices still up; wrappers advancing.....Wilmington, N. C. Late storms did much damage. Corn very scarce: all provisions advancing. Labor Unions demanding higher pay..... Charleston, S, C. First arrival of new crop of rice. Receipts of cotton since Sept., 1, 18,088 bales, against 30,015 for some period last year: falling-off owing to direct shipments from interior to northern ports. Crop opening well.....Savannah, Ga. Owing to expected shortness of cotton crop, season will be shorter and prices more firm and uniform than last year.....Atlanta, Ga. Cotton coming in rapidly. Fine rain on Thursday.....New Orleans. Labor strike over after embarrassing business for two weeks. In sympathy with decline in Liverpool, cotton has weakened—spots ⅛c. and futures for the near months 24 to 30 points. Showers for last two days may benefit cane and late vegetables, but not cotton. Rice coming in freely and sells as fast as milled. Pork and corn scarce and higher..... ....Little Rock, Ark. Slight rainfall on Saturday. Farmers are putting in a good amount of wheat.....Nashville, Tenn. Wheat steady; millers taking all offered. Corn quiet but firm. Provisions active and higher. All produce light and prices full..... ....Montreal, Canada. Crops are turning out well and the farmers' outlook is generally satisfactory.....St. Johns, N. B. Cereal crops are scarcely an average. Vegetables and small fruits good.....

THE Galveston News estimates that three-fourths of the good black walnut of this country has been used up within the last ten years. Recalling the fact that good black walnut is worth $150 per 1,000 feet, and that it requires 100 years to grow a good black walnut tree, the question is asked whether it is not about time to give some attention to forestry as a popular science.....The mails bring favorable reports about the prospects of the supply of Australian wool.....Within a few weeks 32,000 acres of United States lands at $1.25 per acre, and 20,000 acres of swamp and overflowed lands at 25 cents per acre, have been purchased at Jackson, Miss. These lands, which are all uncultivated, lay in Southeast Mississippi, and have been purchased by railroad companies for the purpose of locating immigrants.....The rice crop in Beaufort Co., N. C., has been reduced to one-third of a crop by the dry weather. It is added that some farmers there, who went largely into rice, will do well if they make expenses. Fortunately, however, very few trusted to rice alone. The expectations as to cotton and corn will not be fulfilled; but, notwithstanding, the cotton crop thereabout, it is said, will be a fair one, owing to the swampy character of the land in that section.....In England and Wales it has generally been supposed that large farms were the rule, but recent statistics show upwards of 346,000 out of the total of 473,638 holdings are of 50 acres each or under. The farms above 1,000 acres number 506. In Scotland out of 80,101 holdings 55,280 are of 50 acres or under, and 79 only exceed 1000....

....The wines in the Champagne country are reported to be exceptionally abundant, but inferior in quality. This year the Burgundy district will yield a small but rich vintage. The same may be said of the Bordeaux valley .....About 1,500 bushels of potatoes are shipped by boat from Albany, N. Y., daily. The prices received vary from $1.75 to $2.12. The supply comes from the counties immediately surrounding Albany County.....The amount to be given in premiums at the Western New York fair, to be held in Rochester, beginning on the 27th of this month, is $13,000.....The following report of the condition of the crops was issued by the Department of Agriculture on Sept. 15:

COTTON.

The reports of September 1 to this department show a very heavy decline in the condition of cotton since the last report, owing to a protracted drought which has prevailed in all sections of the cotton belt. The condition as reported is 72, a decrease of 16 per cent. during the month of August, and as compared with the returns at the same date last year, is 19 per cent. less. The reports are from 330 counties of the cotton section and are somewhat less in number than usually received. The number of counties and States averages are as follows: North Carolina, forty-two counties, reporting average 72. South Carolina, twenty-two counties; average, 68. Georgia, fifty-five counties; average, 71. Florida, fourteen counties; average, 87. Alabama, thirty-three counties; average 80. Mississippi, thirty-seven counties; average, 74. Louisiana, fifteen counties; average, 76. Texas, sixty counties; average, 65. Arkansas, thirty-one counties; averag, 55. Tennessee, twenty-one counties; average 62.

CORN.

The general average condition of the corn crop on September 1 was 60, being 17 per cent. lower than the month previous and 31 per cent. lower than a year ago at the same date. The cause of the low condition existing in almost every section of the country is drought. New England is less affected by it than any other section east of the Mississippi, and reports an average of 90. In Wisconsin, Minnesota and most of the Territories there has been more seasonable weather, and the condition of the crop is correspondingly better, but in all other sections the reports show the effects of an unusually dry season. From Illinois, Missouri and Kansas come serious complaints of ravages by the chinch bug, added to the prevailing drought, and the injury to the crop prospect is shown by the State averages, which are 58, 42 and 65 respectively.

TOBACCO.

The returns from correspondents give a very serious decline in the prospect for the tobacco crop, being some 20 per cent. less than a month since. With the exceptions of the States north of the Delaware River and Wisconsin in the West the universal complaint is drought. Kentucky and Illinois each report but little over half a crop, while Tennessee and Missouri report less than two-thirds. The average for the whole country is only 65, against 85 last month and 84 at this same date last year:

E. A. CARMAN, Acting Commissioner.

There is a talk of holding a national convention of sorghum cane-growers in Chicago at the end of the season, and of their organizing a National Association of Cane-growers, with the object of still more vigorously pushing the industry.....Australia and New Zealand take nearly all the surplus hops of the Pacific Coast.....Potatoes are rotting very badly in New Jersey.....John B. Raymond, of Fargo, Dakota, says that he has harvested this season $50,000 worth of wheat from a farm that cost him only $59,000 two years ago. There shouldn't be a rush of farmers to buy such little farms there, though.....Early last week a dispatch from St. Louis announced that the two chief barge lines between that city and New Orleans had been definitely sold to the river transportation company organized by Jim Keene; that its present capital was $2,000,000, and that it intended to control the carrying of all the grain on the Mississippi to the Gulf.....The Earl of Dunraven owns 30,000 acres in Colorado, and visits his place frequently for "sport."....The owner of a large cranberry farm at Berlin, Wis., who employs hundreds of girls, promises to marry the one that picks the most berries this season—providing she'll have him. She won't be the prettiest or sweetest-tempered, sure; that sort are seldom the best workers.....Delaware turns out 300,000 baskets of peaches this year, against 4,000,000 last year.....B. B. Allen, of Reading, Pa., last Winter agreed to give a horse and sleigh, valued at $150, for half of the crop which George Thompson's peach orchard was expected to produce this Summer. The crop amounted to just two peaches, one of which was handed to Mr. Allen—a dear peach for $150.....The Southern States possess a chicken syndicate. Six firms virtually control the poultry market. The combined capital is $50,000. Their agents receive five per cent. for purchases not only of poultry, but eggs, butter and sausages. The headquarters are at New Orleans, Savannah, Charleston, and three places in Tennessee.

The area under wheat in India, according to the report of John B. Conner, Chief of the Bureau of statistics for India, issued Sept. 2, 1881, is this year 3,191,323 acres, against 2,517,719 last year, showing an increase of 673,605 acres, or nearly 27 per cent. The area under corn, as per same report, is this year, 3,145,411 acres, against 3,421,509 acres last year, being a decrease of 276,098 acres, or a trifle over 8 per cent.....The reports from Kustendeji, under date of 27th ultimo, state that the Danubian maize crop will be only half an average; and Galatz advices of 22d August state that the weather had been hot, causing serious damage from drought to the maize crop of Roumania.

You Must Try It.

Do not despair even if you have suffered for years from weak kidneys and torpid bowels. Kidney-Wort has cured hundreds of cases of from five to thirty years' standing. This remedy is prepared both dry and liquid.

Lydia E. Pinkham's Vegetable Compound revives the drooping spirits; invigorates and harmonizes the organic functions; gives elasticity and firmness to the step, restores the natural lustre to the eye, and plants on the pale cheek of beauty the fresh roses of life's Spring and early Summer time.

To produce real genuine sleep and childlike repose all night, take a little Hop Bitters on retiring.

A Fine Hair Dressing.

COCOAINE dresses the hair perfectly, and is also a preparation unequalled for the eradication of dandruff.

The superiority of BURNETT'S FLAVORING EXTRACTS consists in their purity and great strength.

The Markets.

CROPS AND MARKETS.

COPIOUS rains all over the country during the past week. Unstacked grain has been more or less injured in may places. Telegrams from Minn., this morning, say the reports of injury from this cause in that State were exaggerated. The wheat coming in grades well. Up to Friday evening the rain-fall at 24 Signal Service stations in the Cotton Belt averaged 2.09 inches, against 1.26 inches for the corresponding month last year, 0.01 inch last week. Last week's Washington telegram gave the rainfall at 0.09 instead of 0.01; but it was only a a mere trifle whichever is correct. There have been wide fluctuations in breadstuffs during the week, but the markets have, on the whole, been favorable to holders and to an advance in price. Advices from Europe tend to strengthen prices for grain, for while they confirm previous advices of the surplusages of grain in some countries, they intimate that the needs of others will be larger than hitherto counted upon. As yet no really trustworthy estimate can be formed of the deficiency or surplusage of grain in various countries, but the following table shows the matter approximately.

IMPORTING COUNTRIES.

	Bushels.
United Kingdom	128,000,000
France	48,000,000
Belgium, Holland and Germany	16,000,000
All other importing countries	20,000,000
Total	212,000,000

EXPORTING COUNTRIES.

United States	75,000,000
Russia	50,000,000
Austria-Hungary	8,000,000
Egypt	400,000
Chili and Australia	16,000,000
British India	4,800,000
All other countries	6,000,000
Total	160,200,000
Apparent deficiency	51,800,000

Probably this will have to be considerably modified on receipt of later detailed information, but it is the best we can offer just now.

Up to Friday evening, wheat flour had gained, for the week, in New York market, 10@20c. per barrel: wheat, for prompt delivery, 2¼@4c.; the several grades and qualities of corn other than No. 2 (which left off steady), 1@2c.; rye, 2@3c., and oats, 2½@3½c. per bushel. On the option list, the alterations up to Friday evening had placed No. 1 white wheat at an advance of 1½@2.; No. 2 red do., 1¾@2¾c.; No. 2 oats, 1@1½c. per bushel. In other large receiving centers the advance in prices varied slightly from this in accordance with local receipts of grain, storage room, nature of speculation, etc., etc.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 17, 1881.

BEANS AND PEAS.—New beans have arrived freely and have sold quite up to the receipts, making a strong market. There is very little of any old brands on the market. Red kidneys are expected to open well. Wisconsin green peas are in better demand and higher; $1.60@1.65. There is no stock rate for So. II. E. peas.

Marrow beans, new, $3.05@3.10; mediums, $3@3.05; pea, $3.05@3.10; white kidney, old, $2.80@2.70; red kidneys, $1.75@2.10; black or turtle soup, 1.70@1.75.

Receipts of beans for the week, 9,076 bush.

Exports do. 625 bbls.

BUTTER.—There has been considerable lull in the demand and the tone of the market is easier except for faultless styles of table. Creamery now has a strong competitor in the way of the State lines and dairies and a good deal of the best trade is running upon them. The under class of trade is turned to Western, for which there is no change in prices. Elgin creamery has made State figures in some cases, but that grade of butter requires cold weather in order to hold its full prominence. Many of our correspondents intimate that the show for fall butter is not as unfavorable as it was at one time thought to be, and some assert that they have nothing to fear except early frost.

Creamery, finest tubs, 34c.; good to prime, 28@30c.; poor quality, 24@25c.; sweet cream, 27@29c.; creamery firkins, 28@31c.; State dairy do. 26@28c.; do. half tubs, choice, 30c.; do. fair to prime, 26@29c.; Welsh tubs, 25@29c.; poor State, 23@26c.; Western imitation creamery, 25@26c.; dairy, choice, 26c.; other, 17@24c.; factory or ladle-packed June, 18@19c.; other, 16@17c.; common Western, 15@16c.

Receipts for the week, 37,609 pkgs.

Exports do. 8,779 do.

Cold storage on steamer to G. B., 90s.

CHEESE.—The market has ruled quiet all the week and some of the receipts have held over. Dealers have named prices rather stiffly in sympathy with interior rates, but shippers have not been urged to purchase and it will require assured light receipts next week to support present views of holders. The home trade is fair. Average quality has rolled off, but the fact is cheese has turned out so finely this season that a very little difference is soon noted.

State factory, fine colored, 12½@12¾c.; fine white, 12½@12¾c.; good to prime, 11¾@12¼c.; fair to good, 10¾@11¾c.; poor to fair, 9½@10½c.; Ohio factory, cheddar, fine 11@11½c.; fair to prime, 10@10¾c.; factory, flat, fine ½bbl, 12@12½c.; good to prime, 10½@11c.; fair to good, 9½@10½c.; poor, 8½@9¼c.; Creamery, partly skimmed, 4@9c.; fully skimmed, 3@4c.; full-skimmed factory, 3@4c.

Receipts for the week, 85,225 bxs.

Exports do. 53,522 do.

Liverpool cable, 62s.

Steam to Liverpool, 29s. 6d.@30s.

COTTON.—The market has had a quiet rule. Out-of-town representative orders are few, but the new and lower rates have revived considerable spot buying. Crop reports more encouraging for consumers,

Futures fairly active at irregular prices, closing steady at a decline of 21 to 30 points.

September, 11.65@11.87c.; October, 11.70@11.82c.; November, 11.63@11.82c.; December, 11.70@11.93c.; January, 11.85@12.12c.; February, 11.98@12.22c.; March, 12.14@12.36c.; April, 12.21@12.45c.; May, 12.34@12.57c.; June, 12.47@12.69c.; July, 12.57@12.66.

Receipts for week, 15,312 bales.

Exports do. 21,500 do.

EGGS.—Receipts for the week, 9,010 bbls.; do. last week, 6,786 do. An increased grocery demand has made a place for the addition to receipts. Prices are running quite close together, which is an advantage for Western lots.

Near points, ₰ doz. 23½c.; State and Penn. 22@22½c.; Canadian, 21½@22c.; Western, fresh, 21½@22c.; other useful grades, 19½@20½c.

FLOUR.—The market holds the advanced prices and circumstances are in favor of the seller. The stock of sorts suitable for the high wants of home use is very scarce and all old stock is firmly held. Exporters' orders will be limited until lines are of more commercial bulk. Rye flour and corn meal firm.

No. 2, $4.90@5.10; State and Western, superfine, $5.40@6.10; city mills, extra, $7.25@7.50; Spring wheat, extra, $6.15@6.40; Spring XX and XXX, $6.50@7.50; patents, $7.25@9.25; Ohio round hoop shipping, $6.30@6.65; trade brands, $6.75@7.25; St. Louis extra, $6.50@6.75; do. double extra, $6.80@7.15; do. family, $7.25@7.75; Southern extra shipping, $6.60@7; do. XX and family, $7.25@8. Rye flour, superfine, $5.90@6.30. Corn-meal, Brandywine, $3.90@4; do. Western, $3.80@3.90.

Receipts of flour for the week, 115,910 bbls.; corn-meal 4,353 do.

Exports of flour for the week, 62,430 bbls.; corn-meal 3,113 do.

FRESH FRUITS.—A strong upward feeling prevails in all fruits, pears showing the most important advance. Cranberries are uselessly seeking a market.

Apples, Golden Sweet, Western New York, ₰ bbl., 75c.@$1; Western New York, prime Fall, $2@2.25; do. Fall, fair, $1.50@1.75; Gravenstein, near-by, $2.25@2.50; 20-oz. near-by, $2@2.25; Malden Blush, near-by, $2.25@2.50; Fall Pippin, near-by, $1.75@2.25; Baldwin, Jersey, ₰ d.-h. bbl. $2@2.25; Greening, do. $1.75@2; poor to fair, ₰ bbl. $1@1.25. Pears, Bartlett, up river, ₰ bbl. $5@6.50; Western New York, ₰ keg, $2@3; Louise Bonne, Western New York, $3@4; Sheldon, do. $3@4; Sour Bell, $1.50@2; Seckle, choice, $1@3; fair to good, $2@3.50; Swan's Orange, $3@4; Cooking, $1.50@2. Peaches, Jersey and up river select, fancy, ₰ basket, $2.50@3; choice lines, $1.50, good, $1@1.25; common, 60@70c.; culls, 40@50c. Plums, Quackenbush, State, ₰ qt. 10@15c.; Reine Claude, ₰ bbl., $3@10; Copper, $7.50@8; Damson, ₰ bbl. $6@7; do. ₰ ½ bush. crate, $1.25@1.50; common, ₰ crate, 75c.@$1. Grapes, Del., State, case of 18 3lb bxs, $4; bskts, ₰ lb, 6@7c.; Concord, State, case 18 3lb bxs, $2.50@2.75; do. in bskt, ₰ lb, 3½@4½c.; Jersey case of 24 2lb bxs. $1.75@2; up river, loose, ₰ lb, 3@4c. Watermelons, Maryland selected, ₰ 100, $30@3*; seconds, $15@20; Jersey, Black Spanish, $10@20; Culls, $5@8. Nutmeg Melons, Hackensack choice, ₰ bbl., $3.50@4; Keyport, choice, $2; culls, $1@1.25. Nuts—Peanuts held with confidence; demand fair. Pecans quiet but firm. Peanuts, Va., hand-picked, ₰ lb, 7½c.; fancy, 7c.; extra prime, 6½c.; good to prime, 6¼c.@6½c.; shelled, screened, 6@6½c.; shelled, unscreened, 5½@6c; pecan nuts, ₰ lb 8@10c.

GRAIN.—The market has had no noted periods of excitement. The enlarged visible supply of grain, with prices where they are, tends to cool the ardor of wild speculation. This more particularly applies to wheat; corn still supports the outlook given it a few weeks ago.

Wheat, Spring, $1.35@1.39; Spring No. 2, $1.37@1.38; red Winter No. 2, $1.16¾@1.17; red Winter, $1.25@1.19; white Western and State, $1.35@1.45. Rye, $1@1.09. Oats, white No. 1, 53c.; No. 2, 52c.; No. 3, 50@50½c.; mixed, No. 1, 44c.; No. 2, 43@43½c.; No. 3, 41@42c. Corn, Western mixed, 68@72c.; No. 2, 70@71½c.; yellow, 70@74c.; white, 79@81c.

Receipts for the week, wheat, 18,578,900 bush.; corn, 1,554,300 do.; oats, 285,200 do.; rye, 23,191 do.; malt, 34,300 do.

Exports for the week, wheat, 1,360,850 bush.; corn, 251,833 do.; oats, 2,877 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes and on Mississippi River:

	1881. Sept. 10. bush.	1880. Sept. 11. bush.	1879. Sept. 13. bush.
Wheat	19,848,526	14,117,013	17,927,079
Corn	24,083,101	18,500,809	12,040,962
Oats	6,789,859	1,513,361	2,461,082
Barley	358,752	331,215	825,156
Rye	645,389	1,31,672	950,771
Total	51,725,427	35,347,570	31,205,080

HAY AND STRAW.—Receipts of hay have become light. Prime and medium grades are in best demand and favor sellers; a few lots of strictly fancy Timothy reach $1.05. Straw quiet and unchanged.

Prime Timothy hay, ₰ 100 lbs., $1; medium Timothy, 80@90c.; shipping grades, 55@60c.; clover mixed, 55@60c.; clover, 50@55c.; long rye straw, 65@70c.; short, 50@55c.; oat and wheat, 35@40c.

Exports for week, 1,362 bales.

HOPS.—Receipts of new are moderate, but the demand is not calling for large lots in any way. Most of this year's picking shows very irregular quality, and buyers will not operate until grades are more decided.

Crop of 1881, Early Seedlings, 18@23c.; 1880, choice, 19@20c.; 1880, good to prime, 15@17c.; 1880, fair to good, 13@15c.; 1880, poor to fair, 10@12c.; 1880, eastern, 10@18c.; 1879, fair to prime, 12@14c.; 1878, 5@8c.

Receipts for week, 367 bales.

Exports for the week, 9 do.

MILK.—Lack of cooling facilities are still complained of. Springs are low and well-water is scarce in most of the dairy districts that ship milk to New York and many cans sour on the way. Prices for perfect have averaged $2.51 for commission cans of 40 quarts, and have been up to $3.

POULTRY AND GAME.—Dressed poultry begins to feel the pressure; receipts and supplies are likely to keep prices easy from this time onward. Dealers do not, however, look for the swamping supplies that have attended the markets for several years past, and in truth we can get along with less. Prime turkeys have a good demand; a feature of the poultry trade is the fairly steady sale that has attended them during the Summer.

Turkeys, Phila. prime, 18@19c.; State and Western dry-picked, 16@17c.; scalded, 17@18c. Chickens, Phila. 16@18c., Bucks Co. 20@21c.; Jersey, 19@20c.; State, 16@17c.; Western, 15@16c. Fowls, Phila. dry-picked, 16c.; Bucks Co. 15½@16c.; Jersey, dry-picked, prime, 15@16c.; do. scalded, 15@16c.; State and Western, dry picked, prime, 15c.; scalded, prime, 14@15c.; inferior, 12@13c. Ducks, Spring, Phila. ₰ lb, 16@18c.; Jersey and Bucks Co. 16@17c.; State, 14@16c.; mixed State, 12@14c.; old, fair to good, 10@12c. Squabs, white, ₰ doz. $2.25; dark, $1.50.

The broods of prime heavy chickens seem to have been very much depleted; very few crops that can be rated fine now arrive, particularly of Western stock. Fowls easier. Turkeys steady. Ducks and geese quiet.

Chickens, New York, ₰ lb. 16@17c.; State and Penn. 15@16c.; Western, 14c.; Southern, 13@14c.; Fowls, Jersey, State and Penn. 14c.; Western, 14c.; Southern, 13@14c. Roosters, old, 6@7c. Turkeys, Jersey and Penn. 14@15c.; Western, 13@14c. Ducks, Jersey, extra-large, ₰ pair, 90c.@$1; Jersey, New York and Penn. 55@70c.; Western, 40@50c.; Southern, 40@45c. Geese, Jersey, N. Y. and Penn. $1.62@1.87; Western mixed and Southern, $1@1.25. Pigeons, full-grown, 25c.; young, 20c.

Grouse arrive in better order and have a readier sale. Other game birds are firm. Venison is quotable in a small way at 15@20c. for Minn. Wild ducks will not be wanted until next month.

Grouse, prime, 75@80c.; partridges, $1.25@1.50; woodcock, Stnte, 75c.@$1.12; English snipe, ₰ doz. $1.50@1.75; plover, $1.12@1.75; reed-birds, $1; blackbirds, 20c.

PROVISIONS.—There is an easier feeling anticipated as a controlling speculative interest is working for a cheaper phase. For spot goods, however, prices are fairly strong.

Pork, extra prime, ₰ bbl. $15.50@16; Western mess, new, $20. Lard, steam Western, ₰ 100 lbs., $13.35@13.40; prime city, $12.25@12.30. Hams, smoked city, ₰ lb. 13½@14c.; pickled Western and city, 12@13c.; Shoulders, smoked city, 8¾@9c.; pickled, 8@8½c. Rib bellies, pickled, 10½@11¾c. Bacon, long clear and Western, 11@11½c. Beef, Western mess, ₰ bbl. $12@13; packet, $13@14; India mess, ₰ tce. $22@24. Beef hams, ₰ bbl. $22@22.50.

Receipts for the week—Beef, bbls. and tcs. 550; pork, bbls 4,600; cut-meats, pkgs 24,200; lard, do. 19 250.

Exports for the week—Beef, bbls. and tcs, 2,650; pork bbls. 3,325; cut-meats, lbs. 1,531,780; lard do. 1,517,400.

SEEDS.—Clover seed quiet and unchanged. Timothy in continued active demand and firm. Rough flaxseed quiet.

Clover, Western, 1880, job lots from store, 10½@11c.; do. in car lots on track, 9½@10c.; 1879, do. 9@9½c. Timothy, job lots in store, $2.90@3.25. Flax-seed, American rough, $1.42½@1.45.

Receipts for the week, 3,670 bush.

Exports do. 1,489 bush.

TOBACCO.—Buyers of leaf are not operating so promptly as an impression has gained that the next turn in price will be in their favor. Some late prices are as follows: Kentucky quiet but very firm; hhds., $6¾@15. Seed leaf fairly active; cases 1880 Pennsylvania, 11¾@20c.; 1880 New England, 12½@35c.; Wisconsin, 5@15c.; 1880 State, private terms, Ohio Wrappers, 10@15c.

VEGETABLES.—Prices hold up well even under larger supplies. Some lots of fine State are held with a view to better prices when Long Islands fall off in receipts. Exports fair for prices: for the week, 2,775 bbls. Sweet potatoes higher.

Potatoes—Early Rose, L. I., ₰ bbl., $2.62@2.75; State and up-river, $2.37@2.50; Snowflake, $2.50; Burbank, $2.50; Peerless, Jersey, $3.50; sweet potatoes, Va. yellow, $3.50@3.75; Del. river, $4.

There is a general feeling of firmness in garden truck; cabbages show a large advance; onions firmer than for several weeks past.

Sweet corn, Jersey, prime ₰ 100, 75c.@$1; poor, 50@60c.; wax beans, L. I., ₰ bag, $1.50; string beans, $1.50; Lima beans, potato, $2.50@3; flat, $2.25@2.50; cucumbers, L. I., ₰ 100, $1.25; pickles, ₰ 1,000, $2.25@2.50; egg plant, ₰ bbl., $1.25@1.50; tomatoes, ₰ bush., 30@40c.; squash, Marrow, ₰ bbl., $1.50@2; cabbage ₰ 100, $1@10; beets, L. I., ₰ bbl., $1.50@2; white onions, $2@2.50; yellow, $2@2.25; red, $1.75@2; Chester, $1.75@2; carrots, $1.50@2; turnips, Russia, $1.25@1.75; okra, ₰ 100, 15c.

WOOL.—Market active at the three leading distributing points. Fine wools show an advance of 2@3c.; outlook for business. California and Texas Spring grades are moving rather better than heretofore and rule in sellers' favor. Pulled wool in good demand and firm.

Ohio, Penn. and West Va. XXX and picklock, 43@45c.; X to XX, 41@42c.; No. 2 to No. 1, 38@45c.; coarse, 38@39c.; combing, 42@48c. State and Western X to XX, 38@40c.; No. 2 to No. 1, 36@41c.; coarse, 32@34c.; combing, 38@45c.; combing unwashed, 28@31c. Virginia, West Va. and Md. unwashed, medium, 27@29c. Ga. and Lake unwashed, medium, 24@30c.; coarse, 22@24c.; burry and slightly burry, 16@21c. California, Spring, Northern, free, 35@36c.; middle counties, free, 26@30c.; Southern, 20@26c.; low grade and burry, 19@22c.; Fall, low grade and burry, 16@20c. Texas, choice, free, 25@31c.; fair to good, 21@26c.; low grade and burry, 16@20c. Pulled, super, 38@41c.; extra, 35@38c.; No. 1, 30@32c.; combing, 35@40c.; lambs', 40@42c. Tub-washed, fair to choice, 35@41c.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Sept. 17, 1881.

BEEVES.—Receipts for the week, 14,130 head; do. last week, 13,722 do. Early receipts sold pretty well, but the late arrivals lost the cream of the market. Generally, prices were rated a shade lower for common to medium natives and about steady for the better grades. Texans and Coloradas were not quite so good as on Wednesday and brought about the same prices, selling within the range of 7¾@8¾c. to dress 55 lbs. Poor natives sold down to 5c. to dress 55 lbs, and choice do. up to 12c. to dress 57 lbs and 59c. ₰ head, but 9@11¾c. to dress 55@57 lbs covers most of the sales.

MILCH COWS.—There is a demand for fine cows and $60 has been readily quoted for fine animals. For extras $65 and perhaps $70 might be named. Decent to common cows rate from $30 to $50; but low styles are neglected.

SHEEP AND LAMBS.—Receipts for the week, 37,194 head; do last week, 36,615 do. Butchers wanted all the offerings and paid full yesterday's prices for all grades. Common to good sheep were sold at 4@5½c., and poor to choice lambs at 5@7c.

SWINE.—Receipts for the week, 22,561 head; do. last week, 23,069 do. There was a sharp demand for live hogs to-day, and several car-loads could have been sold at high prices. Slaughterers wanted more than they could get. Some rather common Kentucky hogs sold at 6¼c., and some light pigs at 5½c. Prime corn-fed hogs would have brought 7c. New Jersey pork, 9@9¾c.; city killed, 8½@9c.

VEAL CALVES.—Live fed calves have sold well all the week, and good stock brings the extreme readily at the close. Buttermilks and grassers are doing very well.

Live calves, prime N. J., 8¾@8¾c.; do. State, 8½c.; poor to good, 6½@8c.; Mount Hollys, 7½@8¾c.; buttermilks, 4@5c.; grassers, 3@4c.

FARMING FOR BOYS AND GIRLS. NO. 35.

HENRY STEWART.

The Cultivation of Corn.

THERE is no other plant that can be cultivated with so much interest or with such useful results as corn. The mere fact that one can nurse his crop, so to speak, day by day, hoeing it and weeding it and watching its rapid growth which is sometimes so fast that it can be seen in progress hour by hour, gives to this plant more than common interest. The past few years much attention has been given to this plant as a farm crop, and hundreds of farmers' boys have engaged in growing it for a premium. I hope next year the editor of the RURAL will send a few seeds of the Rural Corn to the boys and girls of the Rural family and permit them to compete for a prize as well as their fathers and big brothers. To help them in their efforts to succeed in growing some good corn, the following directions for cultivating this crop are given:—

First, the soil should be well plowed. It is very necessary that the soil should be very mellow and fine and deep.

Second, the soil should be enriched with manure or good fertilizers, or both, and these should be well mingled with the soil by thorough harrowing.

Third, the seed should be planted early and not less than four inches deep, and when the seed is valuable, or the produce from a certain quantity of seed is to be measured, it should be protected from crows, blackbirds and cutworms by broad rims of stiff paper set up in the soil around the hill.

Fourth, the soil should be kept entirely free from weeds, and loose and mellow by frequent stirring and loosening, up to the time when the ears are fully formed and the grain is set.

Fifth, the tassel of every stalk of corn that has no ear or silk should be cut off as soon as it appears. Such stalks may be called male stalks, and are as useless in the corn-field as a lot of roosters would be in the poultry-yard when eggs are wanted, or as wethers would be in a flock of sheep when we expect lambs. For such stalks produce no ears, and encourage those that do to yield seed that will produce only barren stalks like themselves. And this should be done, because in growing a crop of corn it should be made one step at least towards procuring seed that would produce a better crop next year; for there is no grain that we grow that has been more improved, or can be more improved by careful cultivation, than corn.

As the object of every intelligent farmer, be he young or old, should be to learn something more than he now knows, from his observation and experience, it is advisable that in each field of corn there should be a few rows kept for experimenting in regard to the manner of cultivation and fertilizing, so that the best method for each soil or locality can be found. It must not be forgotten that what is good practice upon a light, dry soil may be very bad upon a wet clay soil, and we must learn to distinguish the needs of a soil before we can decide what particular method of cultivation should be used upon it.

Corn is usually grown upon sod ground, but equally good crops may be produced upon stubble. The soil should be freshly plowed, moist and mellow, and when the weather is warm the seed germinates and the plants grow with great rapidity. The manure given to this crop need not be so old and well rotted as is necessary for wheat, for corn is what is known as a rank feeder, that is, it will do well with fresh manure, or newly-plowed sod, which answers the same purpose as manure.

Of artificial manures or fertilizers corn needs mostly phosphoric acid and potash. An excellent home-made fertilizer is composed of hen manure, wood ashes and plaster in equal parts, mixed only when it is to be used, or kept dry until it is used, to prevent loss from the mixture of the ashes with the hen manure. It is not well to use too much manure for corn, or there will be too much stalk and too little grain. Twenty loads per acre of manure and a good handful of mixed fertilizer in the hill will be sufficient, with good cultivation, for a large yield.

YOUNG QUERIST.

Minnie F., Durand, Ill., wishes to know if Japan Red Bud, raised from the Rural seed, must be kept in the house this Winter.

ANS.—If well mulched with a little fine straw or leaves it will stand the Winter out of doors.

Harry F., Elmira, N. Y., sends a flower for name, and also asks if the Pyrethrum roseum blossoms and bears seed the first year.

ANS.—The flower was so wilted as to be unrecognizable. The Pyrethrum did not produce seed the first year with us.

"Will," Shelburne, Vt., asks 1, if we have cultivated the Perfection tomato; and, if so, how we like it; 2, is the Crystal City strawberry as early as it is represented to be in the various catalogues.

ANS.—1. Yes; its quality is very good. 2. It is an early berry, and said, by some of our best small-fruit growers, to be the earliest of all.

Susan M., Argyle, N. Y., asks if we think a woman can make money keeping bees.

ANS.—Yes, we think so. But to any new beginner a word of caution is necessary. Do not be misled by fanciful reports from apiaries long established. Begin with a few hives first and gradually work up to a larger number, and thoroughly prepare yourself by study and conversation with experienced bee-keepers, for your work. We think it can be made a profitable employment for women.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK:—As I had a few leisure moments, I thought I would write to let you know how I am getting along with my garden. The young "Elephants" are growing finely, and we expect a large yield. I am testing several kinds of melons this year, among them are the Bay View, Surprise, and Jenny Lind muskmelons, and the Golden Flushed, Excelsior and Japanese watermelons. When they ripen I will let you know as to their quality, etc. I have six varieties of strawberries: Wilson, Chas. Downing, Black Defiance, Glendale, Duchess, and Crescent Seedling. The Black Defiance is the best of them all with us. I am testing the Perfection tomato this year, but as the plants were not set till late, they have not ripened yet. Why don't the cousins write and tell about their gardens, etc. Yours, WILL.

UNCLE MARK:—I received the seeds of the pinks and Judas tree. The pinks are nearly all in bloom and are growing finely. They are very pretty, one of them was over two inches in diameter. Only one plant of the Japan Red Bud came up. I do not see any letters from this part of the country. I guess the people around hear don't know anything about the RURAL. If they took it one year they would be sure to take it again. I wonder if any of the cousins are going to raise silk worms, I think I shall! MINNIE FRITZ.

Durand, Ills.

DEAR UNCLE MARK:—I would like to join your club. My father began taking the RURAL NEW-YORKER last year. I am 13 years old. My sister has over fifty different kinds of pinks, which were raised from the seed you sent. The Sorghum is doing as well as can be expected for the drought. The Washington oats did well and so did the Elephant. Your niece, N. L. ARTERS.

Freehold, Pa.

New Members of the Club for Week Ending Sept. 17.

Scientific.

TREE TRUNKS AS WATER-CONDUCTORS.

PROFESSOR F. H. STORER.

IT is manifest that with trees, in respect to rain—much the same way as with the different agricultural crops as regards dew—there must necessarily be considerable difference in the amounts of water which can reach the ground by way of their trunks. I was myself a good deal impressed a few days since on noticing how large a quantity of water must evidently have come down the stem of a Virgilia tree (Cladrastis tinctoria) near my study window, during a heavy thunder shower, inasmuch as a deep rill or water-course had been worn in the soft soil from the trunk to the adjacent road-way. In this particular tree the conditions were all specially favorable for the descent of water by the trunk; for the tree, having recently been transplanted, was not in full leaf, while the position of the branches as regards the trunk, and the smoothness of both the stem and the branches are well-fitted to insure a rapid and constant flow of the liquid. It was noticeable, moreover, that in this individual tree nearly all the boughs point rather sharply upward—and the more so since the weight of leaves they bear is small—much more indeed than is the case with other Virgilias not far from this one, which are in full leaf. (Professor Storer may have noticed that this tree is somewhat drooping early in the season, becoming more upright later as the wood hardens. Of course, this may be said somewhat of all trees—but notably of the Yellow-wood—EDS.) It is plain, in short, that the relations of this tree to rain-water must be very different from that of trees whose boughs are horizontal or drooping. While such trees must necessarily shed most of the rain which falls upon them directly from their leaves and twigs to the ground, a good part of the water that falls upon trees whose branches turn upward will be carried down their trunks to the earth.

It seems that the matter was studied a year or two ago, in Europe, by Dr. Riegler. He fitted to a number of trees appropriate vessels for catching the water that came down their trunks, as well as that which fell from their leaves, and he set up a rain-guage in an open field in the vicinity. He then noted continually, from the middle of April to the middle of July, the quantities of water that were collected in the several receptacles. His trials were upon a beech tree, an oak, a maple, and a spruce; and the tops of these trees screened spaces of 64⅘, 60¼, 91½, and 30 square metres* respectively. Of all the water that fell during the stated period upon the beech 13 per cent. reached the ground by way of the stem; 65 per cent. dropped from or through the top, and 22 per cent. evaporated. In the case of the oak less than six per cent. of the rain-fall came down the trunk, 74 per cent. fell through the top, and rather more than 20 per cent. evaporated. With the maple 6¼ per cent. of the rain-fall ran down the stem, 71 per cent. fell through the top, and 22½ per cent. evaporated. In the case of the spruce only 1/16 per cent. of the rain-fall came down the stem and 40 per cent. fell through the top. As regards the spruce, however, it was found to be impracticable to distinguish between "evaporation" and the water which was lost by dropping from the ends of the drooping branches.

Out of 32 separate rains observed, it was noticed that water flowed down the stem of the beech 25 times, down the stem of the oak 16 times, down the stem of the maple 15 times, and down the stem of the spruce (with its hanging branches) only nine times. The influence of few or abundant leaves was indicated by contrasting the results obtained on special days in Spring and Summer. On the 12th of May, for example, at a time of copious and continuous rain, when the buds of the oak and beech were wholly or nearly closed while those of the maple were half opened, 24 per cent., 12 per cent., 3 per cent., and 3½ per cent. of the total rain-fall flowed down the trunks of the beech, oak, maple, and spruce respectively. On the 16th of June there was a short rain and the percentage amounts of it which flowed down the trunks of the several trees were 7½, 6⅜, 4¼, and one. On the 15th of July there was a heavy thunder shower of several hours' duration and the quantities of water that flowed down the trunks were, respectively, 13 per cent., eight per cent., six-and-a-half and three per cent. On the 9th of June, on the occasion of a short thunder shower, described as a "cloud-burst," nearly five per cent. of the total rain-fall ran down the beech stem while about three per cent. of it ran down the stems of each of the other trees.

Not to occupy space with the other figures, which are given by Dr. Riegler in detail, it will be enough to say that the amounts of water lost by evaporation from the tree tops were small in May, when the trees were not yet in leaf, and large in Summer. At the time of the short but emphatic rain of June 16th, the evaporation amounted to more than a third of the total rain-fall. On the other hand, at the time of the particularly heavy rain of June 9th, more than 80 per cent. (86 per cent. in the case of the oak) of the water that fell upon the tops came through to the earth and only some 10 or 12 per cent. was lost by evaporation.

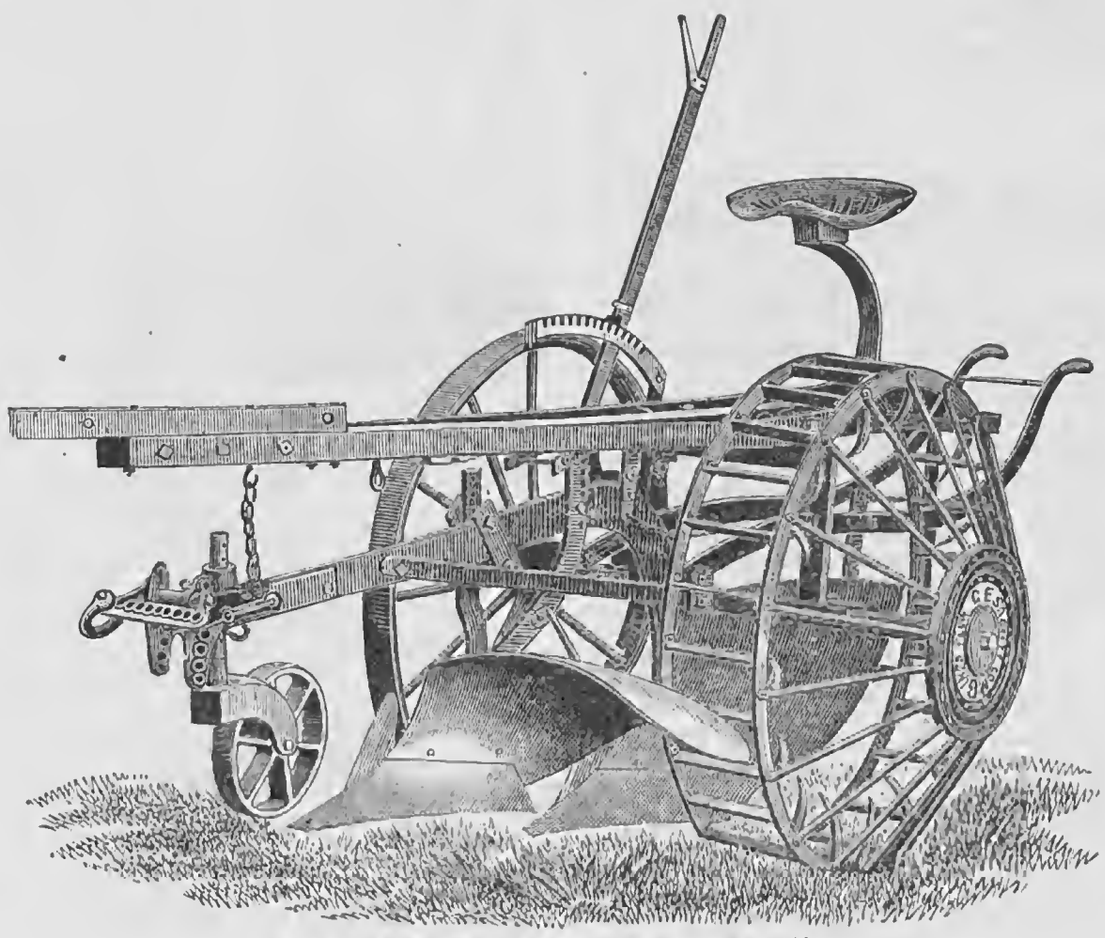
*One metre equals 39.37 English inches.

Implements, &c.

ANOTHER ADVANCE IN MECHANICAL INVENTION.

FROM earliest history there has been some method of scratching, turning, mixing or loosening the soil by animal power in olden times and by steam or animal power in recent days. True, the crooked stick of the Egyptians and the Greeks did very satisfactory work for the agriculturists of ancient days, though it resembled a plow about as much as a flail does a steam thrashing machine; but advanced civilization and a general desire to do the best kind of work in the easiest and quickest manner demanded improved machinery, and this demand has always been well met by our inventors.

Hitherto plowing and harrowing have been two distinct operations, requiring two passages, at least, over the field; but at a recent trial held on the Experiment Farm of Rutgers College, at New Brunswick, N. J., an implement invented by Mr. Charles Sackett, of this city, was exhibited, which performs the operation of plowing and pulverizing the soil at a single passage over the field, thus saving time and labor.



COMBINED PLOW AND PULVERIZER.—FIG. 471.

The implement, Fig. 471, consists of an ordinary iron-beam plow, which is attached to the axle at right angles, in front of which is a smaller plow for inverting sods, weeds, etc. The plows may be set at any desired depth, and are adjusted with ease. The pulverizing wheel runs in the furrow, and is formed by a series of cross-bars connecting two parallel rims or tires, supported by iron spokes. These cross-bars may be set at any desired distance apart, according to the condition of the soil, The rear plow, being set directly opposite the pulverizing wheel, throws the earth into the wheel, which, in revolving, breaks up the lumps, and the soil, thus aerated, falls through the wheel in the rear upon the sod or weeds which the forward plow has inverted, and is then ready for the seeding.

Mr. Sackett has also invented and patented a seed-drill, which is to be attached, so that the operations of plowing, pulverizing and sowing may be performed at one and the same time. The plows are handled either from the ground or from the seat, with equal ease. The wheels constitute the running-gear of the implement on the road or in the field, hence its transportation is convenient. No skill, beyond common-sense, is required, to manage the implement; time and labor are saved, and the soil is left in a loose, friable condition. We were agreeably surprised at the very creditable performance of this implement in a field where the soil was hard, lumpy and quite stony, yet its pulverization was complete.

This combined plow and pulverizer is now on the market, and the company will take pleasure in answering any inquiries about it which may be sent to 198 Broadway, N. Y.

PERSONALS.

Ex-President Hayes says that Guiteau "is just crazy enough to hang."

Hon. Lionel Sackville West, the new British Minister to Washington, will start for his post at the end of October.

Senator Williams, of Kentucky, has sold his tobacco crop of this year for $21,419.06. It was the product of 75 acres.

Intimations come from Georgia that General Gordon, having made considerable money since his resignation from the United States Senate, is disposed to enter politics again, and may make the race for Governor.

The Duke of Sutherland and a company of Englishmen have purchased 60 square miles of land 60 miles east of Sioux City, on the St. Paul and Omaha Railroad for the purpose of founding a colony. They have a capital of $12,500,000.

Garabaldi's face is described by a recent visitor as absolutely livid, the yellow-white of a corpse, and his hair and beard perfectly white. His eyes, however, retain fire and move about from side to side, following people around the room, without, however, his changing his attitude in the least degree.

Mr. Alexander Stavely Hill, Q. C., member of the British Parliament for West Staffordshire, is at Winnipeg. He is making a trip to Manitoba and the Northwest with the object of placing before his constituents a report of what advantages the country possesses as a place of immigration for the laboring and agricultural population in his crowded district.

W. W. Dickey, one of the wealthiest cattle dealers of the West, met Mollie Carter in Kansas City. He fell suddenly in love with her, for she is a beauty, and she said "Yes" to his offer of marriage, for she knew of his wealth. She broke a previous engagement in so doing, and when Dickey found that out he refused to make her his wife. She sued for $25,000, damages, and has just compromised for $10,000.

KIDNEY-WORT

TRADE MARK.

DOES WONDERFUL CURES! WHY?

Because it acts on the LIVER, BOWELS and KIDNEYS at the same time.

Because it cleanses the system of the poisonous humors that develope in Kidney and Urinary Diseases, Biliousness, Jaundice, Constipation, Piles, or in Rheumatism, Neuralgia, Nervous Disorders and Female Complaints.

SEE WHAT PEOPLE SAY:

Eugene B. Stork, of Junction City, Kansas, says, Kidney-Wort cured him after regular Physicians had been trying for four years.

Mrs. John Arnall, of Washington, Ohio, says her boy was given up to die by four prominent physicians and that he was afterwards cured by Kidney-Wort.

M. M. B. Goodwin, an editor in Chardon, Ohio, says he was not expected to live, being bloated beyond belief, but Kidney-Wort cured him.

Anna L. Jarrett of South Salem, N. Y., says that seven years suffering from kidney troubles and other complications was ended by the use of Kidney-Wort.

John H. Lawrence of Jackson, Tenn., suffered for years from liver and kidney troubles and after taking "barrels of other medicines," Kidney-Wort made him well.

Michael Coto of Montgomery Center, Vt., suffered eight years with kidney difficulty and was unable to work. Kidney Wort made him "well as ever."

KIDNEY-WORT

TRADE MARK.

PERMANENTLY CURES KIDNEY DISEASES, LIVER COMPLAINTS, Constipation and Piles.

☞ It is put up in **Dry Vegetable Form** in tin cans, one package of which makes six quarts of medicine. Also in **Liquid Form, very Concentrated,** for those that cannot readily prepare it.

☞ *It acts with equal efficiency in either form.*

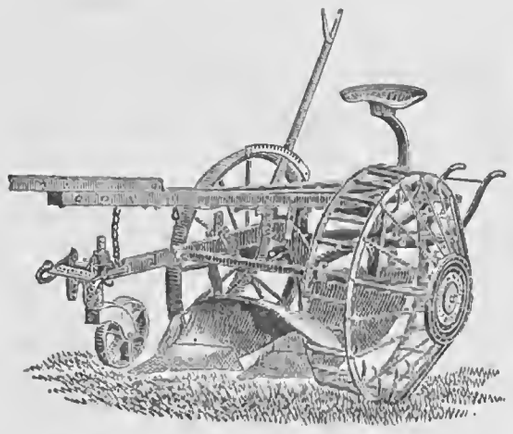
ENSILAGE POWER! Our 2-Horse Eureka Engine and Boiler is just the thing—Safe, Convenient, Durable. B. W. PAYNE & SONS, CORNING, N. Y.

Humorous.

"I HOPE this is not counterfeit?" said a lover, as he toyed with his sweetheart's hand. "The best way to find out is to ring it?" was the quick reply.

OLD GENTLEMAN (musical.)—"Have you any plane tree wood?" Timber Merchant, (whose hopes are raised in anticipation of a good order these hard times) "Yes, sir—pray walk in, sir—as fine a stock as any in town sir. Would you prefer it in the plank or in the—ah—log?" Old Gentleman—"Oh, thanky, I'm not particular. I want a bit for a fiddle bridge."



A REVOLUTION IN PLOWING!

The Greatest Advance in 50 Years.

The Ground plowed; all sods, stubble, and weeds buried; the soil **thoroughly pulverized,** aerated, and left a *fine seed-bed*, without harrowing, rolling, or tramping;

ALL AT

One Operation,

with less team power and at great saving of time. Only *one* man (or boy) required to drive the team and tend the implement. It is thus a great *team-saver*, *labor-saver*, and more important still, a *time-Saver*, in getting in a larger acreage quickly. Mainly Wrought Iron and Steel.

No Cogs or other weak parts to get out of order.

It is adapted also to drilling in seed, and applying fertilizers at the same time that it is breaking and pulverizing the land.

The plows are quickly elevated by a simple lever, and the whole easily runs to and from the field on its own wheels. The driver can walk or ride.

A much larger yield of crop can invariably be expected from ground thoroughly pulverized by this implement than from the old method of plowing.

Thoroughly tested and approved by the best Scientific, Mechanical and Practical men. For circulars giving full particulars, with illustrations, testimony of practical men, etc., address

SACKETT COMBINED PLOW & PULVERIZER CO.,
198 Broadway, New York.

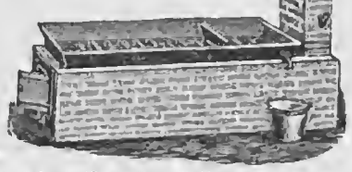
THE IMPROVED EVAPORATORS

Make better
SYRUP, SUGAR, AND JELLY,



with less fuel and labor than any other apparatus Will condense Sorghum Juice faster than any evaporator in use, and consequently make lighter syrup and whiter sugar. The best apparatus known for making jelly from sweet cider. Send for descriptive circulars of Evaporators, Cane Mills, &c. Agents wanted.
VERMONT FARM MACH. CO., Bellows Falls, Vt.

A GOOD SAW MILL For $200.

Our No. 1 Plantation Saw Mill is designed to be run by 8, 10 or 12 horse-power Agricultural Engines. With this power from

1,500 to 4,000 Feet

of lumber can be cut in a day—a product 25 to 50 per cent. greater than can be cut with any reciprocating saw mill with the same power. The mills are complete except saw, and will be put on the cars in Cincinnati for the low price of $200, and warranted in every particular. Saw Mills of all sizes. Engines and Boilers, Shafting, Gearing, etc. Illustrated circulars sent free.

JOHN AND WATER STS.,
Cincinnati, O.

D. LANGELL'S ASTHMA & CATARRH REMEDY.

Having struggled 20 years between life and death with **ASTHMA** or **PHTHISIC,** treated by eminent Physicians and receiving no benefit, I was compelled during the last five years of my illness to sit on my chair day and night gasping for breath; my sufferings were beyond description. In despair I experimented on myself by compounding roots and herbs and inhaling the medicine thus obtained. I fortunately discovered this **WONDERFUL CURE** for **ASTHMA** or **CATARRH,** warranted to relieve the most stubborn case of Asthma in **FIVE MINUTES,** so the patient can lie down to rest and sleep comfortably. Any person not fully satisfied after using one-third of a box can return the remainder to the proprietor and the money will be refunded, or send me your address for a trial package **FREE OF CHARGE.** Should your druggist not keep the remedy, I can send it by mail on receipt of the price **$1.00.** For sale by all Druggists. Address D. LANGELL, Proprietor, Wooster, Ohio, or **ALBERT IMGARD,** Manager, 46 Astor House Offices, New York City.

Founded 1784

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.
The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*
They are the STANDARD for Quality.
Over 1500 acres in Garden Seed Crops under our own cultivation.
Ask your Storekeeper for them *in original sealed packages,* or drop us a postal card for prices and Catalogue.
Wholesale trade prices to dealers on application.
DAVID LANDRETH & SONS, 21 and 23 S. Sixth St. Philadelphia.

LADIES *AGENTS WANTED for "The Ladies of the White House or in the Homes of the Presidents," the most interesting book of Washington Life ever published. A History of every administration from WASHINGTON to the present time. Includes much Personal and Private History never before published. Illustrated with more than 20 Steel Portraits of the Ladies of the White House; also, views of many of the Homes of the Presidents, including Washington, Jefferson, Madison, Jackson, Garfield, &c. Address BRADLEY & CO., No. 66 North Fourth Street, Philadelphia, Pa.*

OF THE **WHITE HOUSE**

NEW EDITION JUST PUBLISHED, INCLUDING A SKETCH AND PORTRAIT OF MRS. GARFIELD.

PRESCRIBED BY PHYSICIANS.

TROPIC FRUIT LAXATIVE

Prepared from tropical fruits and plants.

A Delicious and Refreshing Fruit Lozenge, Which Serves the Purpose of Pills and Disagreeable Purgative Medicines.

TROPIC-FRUIT LAXATIVE is the best preparation in the world for Constipation, Biliousness, Headache, Piles, and all kindred Complaints. It acts gently, effectively, and is delicious to take. Cleansing the system thoroughly, it imparts vigor to mind and body, and dispels Melancholy, Hypochondria, &c. *One trial convinces.* **Packed in bronzed tin boxes only.**
PRICE 25 and 60 CTS. SOLD BY ALL DRUGGISTS.

CARPETS.

AT RETAIL
By the Manufacturers.

We have now open an immense stock of Carpetings, including full lines of all the New Fall Patterns and Styles.

Being the product of our own factories, we warrant every Carpet as represented, and full satisfaction is guaranteed or the money refunded.

Axminster Carpets—We offer 300 pieces of these desirable goods at **$1.75** per yard, the same quality as sold last season at **$2.75.**

French Axminsters—A full line of our own importation at **$1.65** per yard.

American Moquette Carpets—400 pieces at **$1.40** per yard—the cheapest carpets ever offered. These goods cannot be found elsewhere in the city at anywhere near the price.

Velvet Carpets—The largest and best stock of Velvet Carpets in the United States at **$1.50** and **$1,60.** Extra good value.

Body Brussels—Best quality, full five frame, at **$1.25** per yard, special patterns at **$1.40** and **$1.50.**

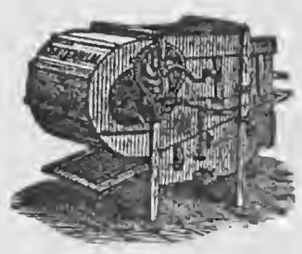
Tapestry Brussels—A very large assortment of popular patterns at **75 cts.** per yard—same goods as sold elsewhere at **90 cts.** Finer grades at **90 cts.** and **$1.05.** A splendid assortment.

Ingrains—Extra superior quality—a very full line from **75 cts.** to **90 cts.** Also a good line of all wool ingrains from **65 cts.** to **75 cts.** yer yard.

Persia and **India Rugs** and **Mats** of our own importation, a large assortment at low prices.

J. & J. DOBSON,
40 and 42 WEST 14th ST., NEW YORK.
John Van Gaasbeek, Manager.

The "Centennial" Fanning Mill.



The best mill in the world. It separates Oats, Cockle, and all foul stuff from wheat. Is also a perfect cleaner of Flax, Timothy, Clover and all kinds of seeds. The great improvement over other mills is that it has two shoes. It is especially adapted for warehouse use. Send for Descriptive Circular and Price List.
Liberal discount to dealers. Address
FREEMAN & SON, Racine, Wis

MOUND CITY FEED MILL.

Our Latest Invention.
The most Rapid Grinder ever made. We make the only Corn and Cob Mill with *cast cast-steel Grinders.* If we fail to furnish proof, will give you a Mill. Ten different styles and sizes. The only mill that sifts the meal. We also make the Celebrated BIG GIANT.
☞ Send for Circular and Prices. J. A. FIELD & CO., St. Louis, Mo.

HOPE FOR THE DEAF
Dr. Peck's Artificial Ear Drums
PERFECTLY RESTORE THE HEARING and perform the work of the **Natural Drum.** Always in position, **but invisible to others.** All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular with testimonials. Address,

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1653.} NEW YORK, OCT. 1, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Horticultural.

MARLBORO SEEDLING.

ON July 29 we received from A. J. Caywood a second specimen branch of the Marlboro Seedling. We know nothing of this from tests at the Rural Grounds, but the branch sent to us was laden with berries as large and bright as any we have ever seen. Many of these measured seven-eighths of an inch in diameter and were of a roundish-conical shape with rather small grains, quite hairy and of a beautifully bright red color. The berries did not seem to be very firm, though of this it is not fair to judge from specimens sent a considerable distance by express. They were very juicy, and of a quality that to our taste is not surpassed by any hardy raspberry in cultivation.

The following is Mr. Caywood's history and description of the Marlboro Seedling: "Fifteen years ago I crossed a variety known as the Globe with the Hudson River Antwerp, and produced a seedling of many good qualities: it was large, fine-flavored, prolific and hardy; but it would each year produce a few imperfect berries. I crossed this with the Highland Hardy or Native and produced the variety which I have named "Marlboro Seedling." The bush is an unparalleled grower and perfectly hardy, not having been buried for the last three Winters, but remaining tied to the stake, yet it is now producing fruit from the terminal buds, while Cuthbert and Highland Hardy suffered considerably from Winter. The arms are very large. Even when the hill is unusually large the fruit is all on the outside. The berry is of the largest size: specimens measured to-day one inch in length and over three-quarters of an inch across the shoulder. Color, light red, approaching scarlet, leaves the peduncle easily, is firm and carries well. The leaf is unusually large and the wood thornless."

MARLBORO SEEDLING.--Fig. 472.

RAYS.

PASSING along that handsome avenue, Prospect Street in Cleveland, I observed a lot of hanging baskets suspended in the veranda of a pretentious mansion. Some were mixed with various plants, but those that pleased me most were filled with but one kind of plant; thus one basket was hidden in English ivy; another in fuchsias; another in the fuchia-like begonia, and a fourth in nephrolepis ferns. The plants—several in each basket—were so arranged that not a particle of the body of the baskets could be seen for leaves or leaves and flowers.

* *

SOME 10 to 20 years ago the prairie farmers of Illinois must have had a mania for planting Lombardy Poplars. Here they stand in belts or hollow squares around their homes, some dead, some dying, some living, some growing, but living trees over twenty years planted are a rarity; indeed, whole belts stand here grim in death. As shade trees they are useless; for fencing, firewood or timber, worthless; they are too weak for shelter belts. You may have planted them provisionally for effect's sake, but now those that are dead, for decency's sake cut them down and burn them.

* *

MIMULUS cardinalis, a native of California and Oregon, where its grows alongside of the water-courses, is one of our very best garden plants. It is a hardy (or nearly so) herbaceous perennial, of bushy growth, some 2 to 2½ feet high, and from mid-summer till destroyed by frost, it is gayly and copiously furnished with cardinal blossoms. It propagates very readily from cuttings or ground-sprouts, and seeds germinate easily; the seedlings raised in spring blossom the same season. One peculiarity about it is, that although its natural habitat is along water-courses, with me it grows and flowers quite as satisfactorily in a dry, sunny border as in the moist ground by the spring. I have had it growing in both places for the past three years. With a handful of litter or leaves thrown over the crowns as a winter-mulch, they survive quite well, but the searing winds of Spring hurt them so badly that I approve of raising a fresh stock from seeds or cuttings every Spring. One stock plant will yield hundreds of cuttings.

* *

FRIEND Boardman lives in one of the prettiest streets of a suburban city, and many folks who do not know him personally are familiar enough with him as the petunia man. The street is an open one with handsome houses, well-cared for lawns, gay beds, and young but comely trees. There are no fences to separate the lots from one another or the street, and a pleasant rivalry exists about who shall keep his place the neatest. Besides some choicer flowers nearer his house, Mr. B. has oblong beds between the side-walk and the street opposite his lot, and the little circles that surround the young maple trees along and half way down the street, he also cares for in a garden way and plants petunias in them every year. These little flower circles set near the outside of the brick side-walk, so novel in themselves, inspire a happy homely feeling; all who pass by appreciate them, no one despoils them.

* *

ONE of my neighbors has a fine stand of sweet peas, which are now, September 2, and have been for several weeks past, loaded with blossoms. She is a careful gardener, gives them rich soil, shelter and lots of water, but she attributes her success more to keeping the seed-pods picked off as they appear. She sowed the seeds some eight inches deep, but whether or not that has anything to do with the luxuriant and lasting condition of the plants in flower I am not prepared to say.

* *

THE same lady has a bed of geraniums (speaking properly I should say pelargoniums) that has disappointed her; the plants have grown well enough, but they have not blossomed sufficiently. They were raised from seed last Spring. Raising seedling pelargoniums may be interesting work, but it doesn't pay. Perhaps not out of a thousand plants can we get one that will equal, let alone supersede, the better kinds already in circulation. But the raiser's seedlings may be like the mother's children—prettier in her estimation than anybody else's. Unless our seedlings are decidedly superior to the standard kinds, we should not disseminate them, no matter how pretty they may be. But how are we to compare them with older sorts? Visit the trial grounds of some of our great florists and seedsmen, Vick's at Rochester, N. Y., for instance, and behold them there in all their glory, a few plants of a kind, all together, and all named or numbered; if your seedlings are better than any in these trial grounds, then go ahead and send them out; but if not, then don't. [As our older readers are aware, several years ago we raised 1,500 pelargoniums from seed, the result of the carefulest crossing of the best known kinds. There were not one dozen plants that were equal to the best kinds in cultivation. One of these we gave to Mr. Peter Henderson, who, under the name of "Rural" offers it in his catalogue.—EDS.]

* *

TALKING of Vick reminds me of his lilies. On both sides of that handsome street, East Avenue, are fields of Japanese lilies, gladioli, zinnias, verbenas, double portulacas and many other pretty things. They are not excluded from the public, but growing right up to the street side—in an open field without a fence, a hedge or a gate. All may see them, walk beside them and enjoy them. Nor are they planted there in patterns or geometrical

style; they are a crop as corn is, set out in rows and cultivated with a horse-cultivator as if they were corn or cotton, pear or apple trees. The smaller plants, as verbenas, carnations and bouvardias, are hoed, not "cultivated."

* *

I HOPE RURAL readers have not fallen in love with the French style of fruit tree training illustrated on pages 515, 516 and 517! Such styles may be good enough and useful in France, but they are nonsense in America. Here our Summers are long and warm enough to ripen our apples, pears and peaches on standard trees; therefore, unless for fancy's sake we have no excuse for such contortions. But many a hundred trees have I knifed and coaxed and tied into those and other kindred styles; but never, no, not even there, could I believe it good—that work my hands had done. Why, the time in labor, painstaking and precision requisite to get those trees into that shape, and the years that must elapse before they yield a crop of fruit, would drive a Yankee crazy! We want remuneration for our pains, and that right quickly; hence our prosperity.

* *

BUT as some readers of the RURAL may be curious to know the why and the how of this training, I will say a few a words more regarding it. Some deem it ornamental, but if such an unnatural contortion is to them ornamental, I pity their taste. It is considered useful in bringing the limbs and fruit more directly under the influence of the sun, and thus hastening maturity and bettering flavor in the fruit, and extra ripening the wood. By this means, too, tender trees may be more easily protected from inclement weather than were they in the form of standards; and peach and other very early-blooming trees may, with little trouble, be protected from frosts, cold winds and rains, when they are in blossom, and thus their fruit crop be rendered doubly certain. Stone-fruit trees are usually grown against walls: pears and apples as espaliers and cordons in the open garden. The accuracy with which the branches are disposed on either side is quite as perfect as the illustrations show, but to have them so demands great care. By foresight and pruning the balance of the tree is maintained, and where a bud fails to grow or a defect exists it is rectified by introducing a bud or graft. And it is a common sight to see a row of espaliers whose branches when they meet are "worked" together. Cordons are trees having but one shoot, and which are bent over a foot above the ground, so that that shoot runs horizontally; or it may be a double cordon, which means that it is has two shoots extending in opposite directions. These cordons are used as edgings to garden plots, and are often "worked" together so as to represent an unbroken belt for any length you please. Examples of fan and palm training may be seen in Eastern greenhouses, where peaches, plums or apricots are grown—out-door espaliers, in the garden of Henry Winthrop Sargent, Esq., at Fishkill, N. Y.; and cordon training at Elwanger & Barry's nurseries at Rochester, N. Y.

* *

BUT I am quite sanguine regarding the pot grape-vines—see Fig's. 384, 385 and 386. Of course only the varieties of the foreign, or Vitis vinifera grapes, are worth fruiting in pots, as it is an expensive process. In fruiting vines in pots the three ends mostly in view are: 1, convenience or economy of space, for we can grow them in any house that is moist, light, airy and warm; 2, earliness, as by having the canes early and well ripened in the Fall we can start them much earlier than would be advisable in the case of a permanent grapery, and have a fruit crop proportionately early; 3, one of the rarest and most tempting dessert dishes you can set upon a banquet table is a laden grape-vine growing in a pot. Grape-vines for this purpose are grown in seven-inch pots, placed within others that are 10 to 12 inches in diameter, so that when the fruits are matured the larger pot, together with the earth and roots contained within it, is removed and only the smaller one, left. But after this operation the vines are practically useless for further pot use.

* *

THIS reminds me that, early last July, on the occasion of a city dinner, a Boston gardener sent in an Early Crawford peach tree growing in a pot and with some thirty ripe peaches on it. The hotel-keeper set the tree upon the table, so the guests might pluck the fruit for themselves. Next day the gardener received back his tree and $15 for its fruit. The earliness of the season was the occasion of the high price paid, but the compliments of the guests and the press notices expressed the appreciation of the novel dish.

LEON.

REMARKS AND COMMENTS.

IN the RURAL for July 30, page 498, I offered a few remarks on the Early Alpha Potato. The editor inquired, "Did they yield well?" In reply I would say, two bushels to 120 feet of row.

MY experience with commercial or artificial fertilizers agrees with "Horticola's," given on page 498. In a dry season they are of comparatively little value, while during a wet season they produce very satisfactory results. However, where they are applied the crop is several days earlier than that on which barnyard manure is used.

HORTICOLA, on the same page, says that excellent early pea, the Alpha, has been uncommonly sweet this season. I have noticed that the Champion of England has been very much sweeter than usual. I have never tried the Alpha, but would say that for a second-early I prefer the Champion to any other variety.

WHILE speaking of peas I would like to inquire whether any of the readers of the RURAL have ever been so successful as to obtain a good crop of green peas in the Fall months. I have often heard of its being done, but with what success I could not say. If any of the RURAL's readers can give us any information on this subject it would be of interest and profit to many. What we want to know is the name of the variety best adapted for this purpose and about what time to plant it.

ON page 501 of the RURAL is an extract from the London Garden relating to Rosa rugosa and its varieties. Are there more than two varieties? I am only acquainted with the rosy-pink and the white varieties.

ON August 8 I gathered my Bloodgood Pears and carried them into the house to ripen, as the fruit of all early pears is so much better if ripened in the house. From my one tree, which is of medium size, I obtained one bushel of pears. The fruit is of medium size, the thick, yellow skin being spotted with russet dots. On account of these the fruit is not very attractive, but, nevertheless, it is of a rich, sugary flavor. The tree is of moderate growth and is an early and regular bearer. When the fruit is about half grown, thin severely, or else most of it will be rendered small and worthless.

THIS is what is termed by some an "off year" for apples; but I notice that where the trees are properly taken care of, some varieties are producing very fair crops. Among them the Large Yellow Bough is one that is deserving of attention. I presume it is well known to all pomologists, but to those who are not acquainted with it I would say that it is in season from the middle of July to the 10th of August. The tree is of vigorous but moderate growth and a profuse bearer. The fruit is large, of a rich golden color, with very tender flesh and a sweet, sprightly flavor, and on this account is much valued for the table.

WHILE speaking of apples I desire to call attention to that very pretty and excellent dessert variety, the Summer Rose. The fruit is of medium size and of a rich yellow streaked and striped with red. The tree is of moderate growth, but is remarkably productive, and in order to obtain fruit of the first quality it is necessary that one-half of the crop should be removed when it is about half-grown.

I NOTICE that in some catalogues that beautiful dessert pear, Manning's Elizabeth, is described as ripening about the end of August. With me it always ripens from the 5th to the 10th. The fruit of this variety is of medium size, of a bright yellow color, with a lively red cheek; it has a very sprightly, sugary, aromatic flavor. The tree is of slow growth, but is remarkably productive.

HORTICOLA, on page 546, remarks that melons are very backward and might ripen a good crop next Summer, and the same remarks are applicable to Lima beans, in this locality, at least. It would be of interest to know how these crops are at the Rural Farm. [Our vines are filled with fruit; but few of them will ripen early enough to be of any value. Cold nights and sweet watermelons do not go together. We shall have a good crop of Limas.—EDS.]

THE Lawton Blackberry canes were all killed to the ground during the last severe Winter, and those of the Kittatinny were severely injured, over half of them having been killed. The surviving canes set a fair crop of fruit this Spring, but instead of the berries ripening perfectly, a few colored black, the remainder turned red, and all shriveled and dried up about the 10th of July. Have any of the RURAL'S readers had any experience similar to mine? Now, were the canes so injured by the past cold Winter that the severe drought of this Summer rendered them incapable of ripening their fruit, or was it the Winter alone that caused the injury? I noticed this Spring that the canes appeared to be much injured. Have the Taylor and Snyder been tried at the Rural Farm, and, if so, with what result? [Both. They are hardy and productive, though the berries are small compared with those of Kittaninny.—EDS.]

WHILE speaking of blackberries I desire to remark that I have abandoned the cultivation of the Dorchester. With me it was anything but satisfactory. The vines grew to an immense size and produced very small crops of small berries. CHAS. E. PARNELL.

Queens Co., N. Y.

NOTES FROM THE RURAL FARM.

The Tomato Rot.

SEVERAL of our correspondents seem confident that it is not the tomato worm which causes the rot in their tomatoes. We do not say that it is. *But* we *do* say that it is this caterpillar that has caused every case of rot in our own tomatoes. We have watched it closely through the season; have seen it move from the leaves to the young tomatoes and nibble out small pieces, generally near the stigma end (or that opposite the stem), and then return to the leaf. Sometimes the pest would remain upon the tomatoes, eating a part—half or more—of the green tomato before leaving it. The injured portions in a few days turn black; rot begins and spreads, involving more or less the entire tomato. In some cases the wound heals, leaving a patch of brown, rough skin. We ask the question of those whose tomatoes have rotted:—Have your plants been infested with these caterpillars? It is quite possible that if not numerous, they may not have been observed. The caterpillar is so nearly the color of the stems that it is often hard to find it, even though directly in front of one's eyes. The leaves which have disappeared from the stems and the droppings underneath, however, afford a sure indication of its whereabouts.

It would be hasty for us to conclude that this or other allied insects are the sole cause of the tomato rot; but we are positive that it is a cause and at the Rural Farm the *sole* cause during the present season.

This insect is known entomologically as Sphinx quinquemaculatus or Five-spotted Sphinx. It is sometimes called the potato worm, though with us it prefers the foliage of tomatoes. It reaches its full length—three or four inches—and the size of one's little finger by the latter part of August or early in September, and then buries itself in the ground where, in a few days, it sheds its skin and becomes a chrysalis. Here it remains until the following Summer when a moth, as shown, (Fig. 475), crawls out and flies in search of food. Our illustrations, from Harris, (see page 668), show the larva, the chrysalis and the moth.

ROTTING OF TOMATOES.

THE TOMATO WORM is no doubt deserving of reproach for his ravages in the garden, but he should not be charged with crimes of which he is innocent. He is clearly not guilty of causing rot in tomatoes, which has of late years been so troublesome, and I think I can convince any fair jury of his innocence of this charge. It has been said of that notorious tyrant, the cruel Judge Jeffries, noted in English history as a most unjust judge who condemned scores of good men and some bad ones to undeserved punishment, that, on being assured of the injustice of a sentence pronounced upon a prisoner, he declared, "Never mind, let him hang; the scoundrel deserves it." So with the tomato worm; he deserves death, no doubt, although not upon this charge.

Last year was the first season in which my tomatoes rotted. I grew then only the Acme. Three years before I grew Trophy, Hathaway's Excelsior, Little Gem, Canada Victor and Arlington. In those years I had no case of this rot, but scores of tomato worms. Last year I don't remember seeing a worm on my tomatoes, and the present season there have been none previous to two or three weeks back. But of the early tomatoes I had not a sound one, and since a few worms have appeared there are but a few rotten ones. But this is circumstantial evidence only, and an *alibi* is but a poor defence unless it is a perfect one, and in this case it is incomplete. But I have more evidence to corroborate it. I have several times examined the rotted tomatoes under a microscope of a power of 400 diameters. Viewed thus, the cause of the rot is very clear. It is evidently of fungoid origin. I have traced it from the beginning, where it appears as a mere speck, and where the teeth-marks of the beast should be visible if he were the cause of it. On the contrary, the skin is not even touched, or even diseased, but the disease is within it, in the under part of the epidermis. There the white threads of the fungus can be seen among the cells of the skin and penetrating down the core of the fruit. Another specimen is affected on one side and the spot on the skin here is covered with well-defined cluster cups of an oval form and a cream color. A section of the skin shows abundant threads of mycelium penetrating between the cells and growing so rapidly that their increase can be plainly viewed on the field of the microscope. A more advanced specimen shows cavities *under* the skin, with dark lining of decayed tissue and filled with mycelium; the core of the tomato is diseased for a quarter of an inch, visibly to the eye, and wholly under the microscope. The appearance of the skin is much like that of a potato affected with rot in its first stages, when it appears as black spots upon the skin. From this I am convinced that the disease is one akin to the potato rot, which we all know had been charged to worms until the real cause was discovered, and I hold the worm guiltless of this crime. H. STEWART.

Farm Topics.

LASTING EFFECTS OF POTASH AND PHOSPHORIC ACID IN THE SOIL.

J. B. LAWES, L. L. D., F. R. S.

As regards the lasting effect of potash and phosphoric acid when applied to the soil, we are in possession of a great deal of interesting evidence. For illustration I will select two experiments from the field under permanent wheat. In 1844, two plots adjoining each other, and containing about two-thirds of an acre each, were manured with salts of potash, soda, magnesia, and superphosphate of lime. In 1845, and every succeeding year up to the present date, one of the plots, which is described as 10 A in the table of my experiments, received an application of ammonia salts.

The other plot, described as 10 B, received the same amount of minerals as 10 A in 1844; and also received the same amounts of salts of ammonia between 1844 and 1850, except on two occasions, in 1848 and 1850, when plot 10 B received minerals without ammonia. The only distinction therefore between the two experiments was that plot 10 A received one application of minerals, and six of salts of ammonia; while plot 10 B received three applications of minerals and four of ammonia. From 1851 to the present time 10 A and B have received every year the amount of ammonia.

The produce of the crop of 1851 was as follows:

	Bushels.	Straw lb lbs.
10 A	23¾	3070
10 B	28¾	3048

It is quite evident therefore that at that date, the single application of minerals, and the soil itself furnished the crop of 10 A with all the potash and phosphate it required.

In the following year, 10 B showed a superiority over 10 A, and this superiority, although a decreasing one, has been maintained up to the present time.

In order to prove that this superiority is due to the two applications of potash and phosphoric acid, which this plot received in 1848 and 1850, we must have recourse to the aid of analyses. Here I may say that, for special purposes, seperate analyses of the ash of each year's crop are essential, but for statistical purposes we mix together the ash of the crops of 10 years. In the present instance I only possess the analyses up to 1871, those of the last ten years not being yet completed; the two periods of ten years from 1852 to 1861; and from 1862 to 1871 will, however, furnish all the necessary information. The amount of potash taken away in the corn and straw from 10 A in 28 years was 700 pounds, of which 56 pounds were supplied in the manure, leaving 644 pounds to be furnished by the soil.

On plot 10 B, 812 pounds of potash were taken off in 28 years, of which 356 pounds were supplied in manure, leaving 456 pounds to be furnished by the soil. I do not, of course, know what will be the result of the 10 years' analyses from 1871 to 1880, but from evidence furnished by the previous analyses, it would appear probable that at the present time the soil of plot 10 B contains about 150 pounds more potash than plot 10 A, and should the experiment continue in its present form, a very long period must elapse before the potash in the two soils can be equalized.

A question here may naturally occur to some of your readers, as to how we know that the wheat crop in these two experiments requires more potash than it can obtain from the soil.

The answer is supplied by another experiment, plot 13 B, to which potash is applied every year, and the result is shown very clearly in the following table:

POTASH REMOVED PER ACRE PER ANNUM.

	10 years 1852-1861. pounds	10 years 1862-1871 pounds
10 A Potash applied once	27	23
10 B Potash applied three times	33	25
13 B Potash applied every year	53	57

It will be seen therefore that while the potash removed annually from plots 10 A and B is rapidly decreasing, in plot 13 B where it is applied every year it is increasing.

As all the experiments receive the same quantity of salts of ammonia every year, it is, I think, evident that the difference in the produce shown in the following table is due to the amount of potash.

AVERAGE OF 28 YEARS, BUSHELS OF WHEAT.

10 A	21
10 B	24
13 B	31½

I may here mention incidentally another very interesting fact, that although in plot 10 A, the amount of potash taken up is being reduced every year, still, more is taken up, and the crop is larger than on another plot where potash and phosphates are applied every year without ammonia.

The limits of this paper will not allow me to follow the results which relate to phosphoric acid; they are very similar, however, in character to those obtained with potash, with this exception that the amounts taken off in the crops are considerably less.

We may learn from these experiments that both potash and phosphoric acid enter into very insoluble combinations with the soil. The salts of potash generally used are soluble in water, and when they are first placed in the soil, if the crop is in want of potash, it can then take it up more readily than at any other time.

In some of our experiments upon permanent pasture nearly the whole of the application of 150 pounds of potash is taken up by the herbage grown upon one acre; if, however, more potash is applied than is required by the crop, then some considerable time may elapse before it can be recovered.

An erroneous application of potash or of phosphoric acid to the soil—by which I mean an application which produces no increase in the crop—is like sending goods to an overstocked market: your manures are in the soil and will be of value some day, but at the moment they are not required; you have, in fact, placed them in an overstocked market.

An erroneous application of ammonia or nitric acid is attended with much more serious results: it is a far more costly substance, and while, under favorable circumstances, one pound of nitrogen may add more than 100 pounds of dry weight to the crop, it is, on the other hand, possible that under the least favorable circumstances the whole may be lost. In my early days the fixing of ammonia in the soil was considered a great discovery; if it be an error to say that an application of ammonia or of nitric acid to the soil, not taken up by the crop during the year of its application, is lost, at all events it is an error on the safe side.

Some time ago I was accused of having ammonia on the brain; it is, at all events, quite true that my experiments show the influence of ammonia on vegetation to be very great. I think, however, that if I were a farmer in the United States I should be disposed to try what the less costly phosphoric acid or potash could do for me; if they failed to produce the desired effect, at all events they would remain in the soil, and instead of adding to the growth of sea-weed in the Atlantic or Pacific Ocean, they could always be made available for vegetation by the application of ammonia or nitrate whenever the existing stock of nitrogen in the soil was exhausted.

Field Crops.

RURAL SEEDS.

BEAUTY OF HEBRON.—While in conversation with a gentleman recently, as to the relative value of different varieties of potatoes, it occurred to me, on hearing the Beauty of Hebron spoken of in such high terms of praise, that it must be a source of especial gratification to the proprietors of the RURAL NEW-YORKER to have been instrumental in bringing this variety so prominently before the public, in so short a time after its introduction, as they did by placing it in their free seed distribution. Should the White Elephant prove equally desirable as a late potato, it will surely be a great acquisition. Speaking of the

WHITE ELEPHANT I must give a brief history of my experience with it this year. I received last Fall, one medium-sized tuber, and it came through the Winter in splendid condition. Well, last Spring I sprouted it in the house, and broke off the sprouts carefully, and planted them out in boxes, to get them ready for transplanting in the open ground. Then I cut the potato to single-eye pieces, and from the one potato I planted 22 hills by this means. I planted them in a field at some distance from the house, thinking they would be safer there than in the garden. They all started finely, and, "Now," said I to myself, "I will have a fine lot of them for seed next year." Just a week later I visited them when, behold! not a vestige of the White Elephant remained except three or four of the larger stalks entirely stripped of the leaves, all having been eaten up by the Colorado beetle. Five or six of the larger pieces I planted sprouted again, but they made a feeble growth, and I got, in all, less than 20 small tubers from them. I hope for better luck next year.

THE RURAL DIANTHUS.—A word of thanks is due for the pleasure we have derived from the magnificent display of flowers from the dianthus seed sent in the last Free Seed Distribution. We have already had about 20 different kinds in blossom, ranging in color from nearly white to very dark, and from single to semi-double, and from that to double, and some of them are pronounced by all who see them to be simply magnificent.

Croton, N. Y. "TREBLE."

Flax Culture in Kansas.

I HAVE raised flax ever since its first introduction into this country and think it yields best on our high prairie soils. It should only be sown on land well plowed, thoroughly pulverized and comparatively free from weed seeds. Three pecks of seed per acre, sown broadcast, have given me the best results, and if carefully sowed broadcast and well covered with a smoothing harrow, it is a reasonably sure crop—at least more so than any other we raise. When the leaves have mostly fallen off, is the proper time to harvest it, and for cutting the Champion Self-rake No. 4, surpasses any machine I have seen operating. I prefer thrashing it as soon as cured; but if not convenient I stack and cover well. The Vibrator Thrasher seems to be the best machine for thrashing flax. The product has been ten to 18 bushels per acre, at an expense of four dollars, and a return of $12 per acre. When cut at the right time the straw is better feed for cattle than prairie hay. The stubble I do not burn, but plow it under. I have found no natural obstacle to flax culture in this State. This year has been an exception to this rule, however, in consequence of extremely dry weather the crop not being more than one-third as good as it has been heretofore.

At ·ison Co., Kansas. H. C. SNYDER.

SOFT WHEAT.

THE RURAL says this is unsalable, quoting from the Pioneer Press, of Minnesota, since "the patent middlings process has entirely changed the values of hard and soft wheats."

I have seen it asserted by a writer on the wheat fields of Manitoba that all sorts of wheat grown there become hard, and make flour worth $2.00 per barrel more than any other sorts grown in a more southern latitude. The reason of this is, that Manitoba wheat contains a larger percentage of gluten, and a less percentage of starch. It is the climate, the

FIG. 474.

writer asserts, which makes this great difference in the quality of the wheat.

The climate of Minnesota, Dacotah, and a part of Montana north of the line of the Pacific Railroad—say at about 48 degrees of north latitude and beyond—must be nearly the same as that of Southern Manitoba. Why then should not all the wheats grown there be hard and contain as large a percentage of gluten? Will the wheat growers and millers of that region enlighten the readers of the RURAL as to this, for the truth of the case ought to be known? A.

WILD RYE OR LYME GRASS.—FIG. 473.

Wild Rye, Lyme-Grass—Elymus Canadensis

This is a coarse perennial grass, found on river banks. The stems grow two to five feet high and bear at the top a gracefully nodding spike five to eight inches long. The flowers bear long awns. The leaves are broad, linear, flat and six to twelve inches long. It flowers in August. At the North, I have never known any domestic animal to eat it; but at the South cattle are said to be fond of it in Winter and Spring. I know of no species of bromus which makes nutritious hay or pasture. As an agricultural grass it is of "no account," but in suitable places in the garden near a pond or brook it is a choice plant which well deserves a place. Especially the glaucous variety is worthy of such a position.

PROFESSOR W. J. BEAL.

Pomological.

NEW FRUITS.

PROBABLY a greater number of new strawberries have been introduced during the past three years than during any previous ten years in the history of this delicious fruit. Of all the new kinds, probably the Sharpless stands first, while Triple Crown, Primo, Shirts, Glendale, Cumberland Triumph, Bidwell and, latest of all, Manchester and Jersey Queen are among those of "great expectations." Of raspberries, the Gregg stands first among Black-caps, the Caroline among the buff-colored, and the Cuthbert and Montclair among the reds. Among plums, nothing particularly striking in the way of new varieties has of late years appeared. Among pears, Kieffer's Hybrid, which is thought to be a hybrid between the Chinese Sand Pear and Beurré d'Anjou, and to be blight-proof, is of very good quality, ripening in October and November. Hoosic is a Mass. pear of good quality ripening in October. The tree is productive and vigorous. Among peaches the Wheatland is a chance seedling on the grounds of E. Rogers, Scottsville, N. Y. The tree is healthy, resembling Crawford's Late, but more vigorous. It bears heavy crops. The peach is of large size and handsome. Mr. Downing pronounces it a very promising late variety for market, being firm, enduring distant shipment and valuable for all purposes of the family. It is a free-stone.

Mr. Downing tells us, speaking of the many early varieties of peaches that have been introduced within the past 10 years, that it is thought that most of these early kinds are reproductions of Hale's Early and Alexander, and so nearly alike that the distinction of name is not worth retaining. Our effort should be directed to obtaining a fruit as early as the Alexander and of as good color, size and quality, free from rot.

Of grapes we have many kinds that certainly promise to eclipse the old favorites. We may name the best as Lady Washington, Brighton, Duchess, Niagara, Jefferson, Prentiss, Pocklington, Quassaick and Rochester. Of many kinds of new apples, the following may be mentioned as promising to be the most valuable: Blue Bloom (September); Brewington Pippin (February); Canada Baldwin (January–April); Decarie (September); Famense Sucree (October); Highland Beauty (January–March); Johnson (December–March); Kinkead (Summer); Peasgood's Nonesuch (September); Snepps (December–February); Stearn's Greening (December–April); Wolf River (October–November). Most of the above fruits have been illustrated in these columns.

PLUM CULTURE IN NORTHERN MICHIGAN.

T. T. LYON.

IN Southern Michigan, the European plum is subject to the depredations of the curculio; and many of the more delicate and desirable varieties are also frequently so far subject to the rotting of the fruit, before maturity, as to be very unreliable. Besides these drawbacks, the foliage often ripens and drops before the fruit is fully grown, leaving the tree to go into the Winter in an enfeebled condition, and hence unprepared to withstand the severe cold.

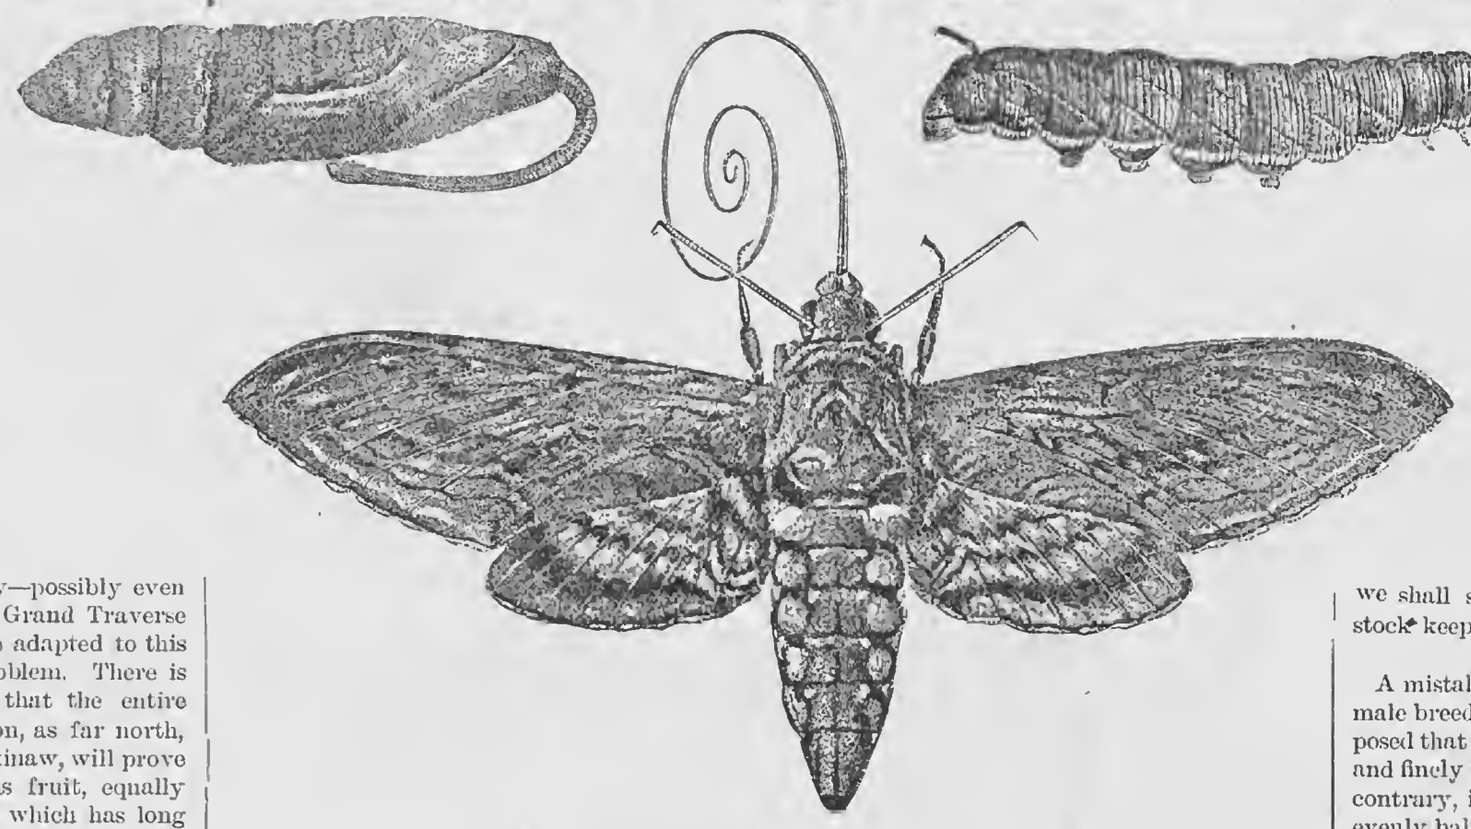
North of Muskegon County, and, so far as I am aware, north of the same parallel on the eastern shore of the State, this fruit is mainly, if not wholly, exempt from these drawbacks. As might reasonably be expected, when we come to learn that (as far north as latitude 45°) the range of the thermometer is rarely if ever lower near the great lakes than in similar situations at the southern line of the State, the most delicate and luscious varieties of this fruit are fully hardy and healthy; nearly or quite free from the depredations of the curculio; and I may add, even more productive than could reasonably be desired.

At Traverse City (at latitude about 44½°) may be seen one of the largest and most successful plum orchards in the State, if not even in the entire Northwest. This orchard, which has now been several years in full bearing, has been exceedingly productive, showing the highest evidence of vigorous health, and has

been but slightly troubled by the curculio, although, contrary to usual practice further south, it is located on exceedingly light, porous sand of such depth as to forbid the assumption that the roots may reach a stronger subsoil. It should, however, be remarked that the ground was originally timbered with beech, sugar maple and basswood, which were occasionally of very large size, and that a microscope reveals the fact that the soil is largely composed of minute fragments of shells, affording an abundant supply of lime to vegetation. It must, however, by no means be supposed that the success of the plum here is confined to such soils. At Manistee, a little farther up the shore of Lake Michigan, one or more of the oldest plum orchards in Northern Michigan stand upon a plateau of the most retentive "hard-pan," with but a very few inches of covering of lighter soil. This also has proved eminently satisfactory. The land is on a gentle slope, and, when last I saw it (in 1874 or '75), it had little or no under-drainage.

This immunity of the plum from the usual drawbacks is found effective as far south as Oceana County—possibly even farther. How far north of Grand Traverse Bay the climate may prove adapted to this fruit, is yet an unsolved problem. There is abundant reason to believe that the entire western shore of Lake Huron, as far north, at least, as the Straits of Mackinaw, will prove adapted to the growth of this fruit, equally with the Dominion opposite, which has long been known as a fine plum region.

The recent pushing forward of railroads into these noted haunts of the lumberman and hunter, is rapidly bringing them to public notice, and farming and fruit-growing are beginning to usurp the place of the logging camp and the lumber mill.



CHRYSALIS, MOTH AND LARVA OF THE "POTATO WORM."—FIG. 475.

The Vineyard.

THE NIAGARA GRAPE.

Reply to Mr. A. A. Bensel.

THE frantic efforts made by Mr. A. A. Bensel, in RURAL NEW-YORKER of August 6th, to bring discredit upon some of the newer white grapes, and especially upon the Niagara, only too plainly show that he has a pet which he thinks is in extreme danger. His efforts would be amusing only they show the extreme jealousy felt by some of the friends of some of the newer grapes towards others of the same class. It is passing strange how he could be so bitter and berate and deride the Niagara so much, and in the same paper commend the previous article by Mr. Green, which certainly was very favorable to the Niagara. We, too, with him, would like to see Mr. Green's article have a wide circulation, and will contribute to so worthy an object. That there has been much systematic swindling done in the dissemination of new grapes even Mr. B. must know, and some of the very worst and most barefaced cases ever known originated on, and were put forth from, the banks of the Hudson River; in fact, it would be hard to name any grape that originated in that fruitful section, which has not proved to be worthless in every other place.

The course pursued by the originators of new grapes there has been one calculated to breed and foster these great humbugs. They would place a few vines here and there to be tested, as they said, but *nine-tenths* of these went into the hands of interested parties, who planted one or two and petted and pampered them to make them show their best, while they were propagating a stock of vines and puffing the variety, so as to be able to sell a few thousands at high prices to a confiding public, to have them found on further trial *entirely* worthless. In proof of this I cite the fact that to-day to the public "new grape" is synonymous with "humbug."

The course adopted by the Niagara Grape Company to test the Niagara is entirely new and different. They place no vines except in vineyards, to be treated only as other vineyards are, and the planter has no right to propagate a single vine, and, of course, he has no interest in anything but the fruit, and no reason to pet the vines or make them "show off," or to misrepresent the grape in any way; and, of course, the people can see the vines and fruit growing in their own neighborhood before any vines will be offered for general sale. This course evidently does not please Mr. Bensel, who is, no doubt, a propagator; but it seems an eminently fair one, and certainly, so far as the public is concerned, *it has no humbug in it.*

Since Mr. Bensel seems to feel so bad over the *imaginary notion* that the Niagara has "*hung fire* too long," and declares that it is "not before the public by being tested in different soils and climates," to cheer his drooping spirits, and to show that he does not know whereof he affirms, I will simply state that today there are more Niagaras growing in Virginia, Delaware, New Jersey, Pennsylvania, New York, Massachusetts, Quebec, Ontario, Ohio, Michigan, Indiana, Illinois and Iowa than of all other new *white grapes* combined; and one vineyard not far from New York City has more Niagaras growing than there are of Lady Washingtons in existence, that are one year old or over. I make this statement only to show facts, and not because I wish to say aught against any other grape. I am only glad that there are so many and such good new grapes, white and colored, and I only hope that many more, and those much better than the Niagara even, may be originated.

I can't see why this jealousy as between the friends of new fruits—it is all wrong, and Mr. Bensel would do much better to use his surplus energies in trying to originate something new and good. This is a great country of ours, and there are a great many people to eat grapes, and there is room for more than all the good grapes we can grow. As to the beauty, quality, hardiness, productiveness and any and all other points of the Niagara, we enter into no controversy; the people must judge of these for themselves, and we are perfectly willing to leave the matter in their hands, assured that they will do it full justice. However much interested parties may sneer at its "unattractiveness" and "disgusting" qualities, and ridicule and run it down, those who know the most of it, and who have seen its broad, thick, dark-green, health-giving leaves, call it *beautiful* and *good*, and the general public have faith in it, and are planting and are going to plant it largely; and we leave it with them and with time to fully vindicate it.

J. S. WOODWARD.
Sec'y Niagara Grape Co.

HOW OPINIONS DIFFER.

The Lindley Grape.

I HAVE before me a slip cut from Green's Fruit Grower, speaking in the highest terms of this fruit, giving not only the writer's opinion, but quoting in its praise from several prominent vintners and pomologists to the effect that it is "one of the best, if not *the* best of Rogers's Hybrids. As to the quality of the grape when you get it fairly in your hand, I can speak only in its praise; but I have six other varieties of Rogers's, any one of which I prefer to the Lindley, not so much on account of flavor or hardiness, in both of which the Salem excels it, but any one of the six has been with me more productive and of more agreeable habit of growth of vine and fruit. The Lindley is long-jointed, with stems very long and large, and bunches long and loose. The canes want all the room you can give them, and do not branch much or turn out much fruit. In the amount of fruit the Merrimac, Wilder and Aminia excel it among the blacks, and Massassoit, Requa, Salem and No. 5, among the reds, and, furthermore, as to flavor, I have more than once placed samples of these eight varieties of Rogers's before a family of old and young persons, and in all cases the Salem got the most votes, and generally the Requa the next highest number. Still there is little difference in quality or beauty between the Massasoit, Requa and Lindley: either of them brings me in our home market more than three times the price of the Concord, and there being but few of these large red grapes in our market, the only question is who shall have them. S. B. PECK.

MINER'S SEEDLING GRAPES.

IN 1878 I bought of T. B. Miner three of his seedling grapes, named by him Linden (black) and Belinda and Antoinette (both white). Owing to late frosts the two past years, this is the first year they have fruited. The Linden is rather small in body and cluster, of good quality, but not particularly desirable as we have plenty of good black grapes. The Belinda and Antoinette are both ripe at this date—Sept. 3d—and are of the finest quality; in fact, to my taste, they are the best in flavor of any white grapes I have ever eaten. They resemble each other so closely that I am unable to distinguish any difference, and judge that Mr. Miner must have made a mistake and sent only one variety instead of two.

A good, early white grape is very desirable for our market, and should these prove as good in the years to come as they now encourage me to hope, they will be a valuable acquisition.

Does any one know whether or not these grapes bear the same names given them in 1878? I fail to find anything relating to grapes by the above names in any of the agricultural papers, but should be happy to hear from others who have had any experience with them. For our market we must have something besides black grapes to sell well, as the "*nasty*" Talman (Champion) has nearly ruined the demand for grapes of that color.

In reading over Mr. Miner's letter I find that he claims there is no essential difference between the Belinda and Antoinette except that the latter is a week or ten days later than the former, and is sometimes shouldered.

NELSON RITTER.

The Herdsman.

NOTES BY A STOCKMAN.

LET us figure up a little. The average value of farm land from the Atlantic to the Missouri may be reasonably estimated at $50 per acre and the taxes at 50 cents per acre. The interest, at six per cent. on the land and taxes would amount to $3.50 per acre. Five acres of pasture and two acres of hay and other Winter feed are required, on an average, to support a cow. The cost then of her feed will be $24.50 yearly. The cost of labor of feeding, milking, and attention, will amount to ten dollars more. The total is $34.50. At two cents a quart for the milk, this will require 1735 quarts in the year, or an average daily yield of eight quarts per 215 days or six quarts daily for about ten months. This is above the average of all cows, including good, bad, and indifferent, and far above the average of the worse half of all the dairy cows.

If the owner of a cow will realize the fact that unless she pays him in clear cash $34.50 yearly, she is kept at a loss, he will soon become interested in the subject of the improvement of dairy cows.

But how will this matter stand when those farms are considered which cost their owners $100 per acre. The cost of keeping a cow on such land will average $59 yearly, and yet we may see constantly in the reports of creameries and cheese factories that the average yield of whole dairies for the season varies from a little more than $30 up to about $40.

It is curious to take the amount of figuring that is done in regard to fowls and sheep, and the absurd and extravagant hopes thus held out delude hundreds of persons into losses and disappointment. A person recently figured so as to show the yearly income from 300 hens to be $1,500. "Each hen lays 250 eggs, which, at two cents each, make $5 per hen." Now there never was a hen that laid 250 eggs in 365 days, which would be equivalent to four eggs and a fraction every six days without any stopping for holidays and brooding spells and molting. It is a good hen that lays 150 eggs in a year, but your poultry hobbyist and sheep enthusiast are not amenable to reason.

It is generally supposed that a ewe brings a lamb and a fleece every year. But in a well kept flock there will always be a number of ewes, perhaps a fourth, that will fail to become in lamb, or that will lose their lambs, and in estimating the yield of wool it is safe to deduct 50 per cent. from the rose-colored estimates of persons who think they know all about it before they have heard the bleat of a sheep.

Co-operative stock keeping is probably the safest form in which associated capital can be employed in agriculture. It has several advantages. A large tract of cheap land can be procured; fencing is unnecessary; the labor and cost of caring for the stock are reduced to the lowest point, and the produce can be disposed of on the best terms and at the least expense. Doubtless in the near future we shall see several ventures of this kind in stock keeping.

A mistaken notion in regard to the size of male breeding animals is prevalent. It is supposed that a large animal must produce large and finely developed progeny. But, on the contrary, it is the small and finely formed and evenly balanced sire that is most valuable for breeding. Some of the most successful sires have been small animals, and, in general, size is of very inferior importance in selecting males for breeding purposes.

It seems that some time ago the fashionable breeders in Jersey took means to close the Herd Book and stop registrations, whereupon fabulous prices were obtained for their recorded animals and they were quickly sold out to American speculators. The breeders, or rather dealers, in Jersey then stocked themselves with cheap unregistered animals, and are now having the Herd Book opened again. The recent boom in imported Jersey cattle is all explained when we discover this hitherto hidden motive power, by which it has been put in operation. It shows very clearly the farcical and ludicrous character of this Herd Book business, and how it is made a means of "milking and shearing" the public just as they are milked and fleeced in Wall Street.

The Jerseys are not making their way into popular use as they should do; and every year that this sort of business lasts, will add to the deterioration of the race. A few sensible breeders are confining themselves to native-bred stock and the rearing of useful cows for high-class dairy purposes; and are letting these imported, fancy cattle alone. An excellent bull or cow of good honest lineage and high quality can be procured from these breeders for one-tenth the price asked by the foreign dealers, whose business is not breeding but buying and selling and going through the farce of "hippodroming," and "rigging the market" by means of their Herd Books.

FARMERS should learn that the pure stock is not the most profitable for them. The cows for profit are grade cows, half and three-quarter-bred, which, as a rule, exceed the pure-bred even in yield very often. Now, we cannot have grades without pure-bred stock and here the benefit of the breeder to the farmer comes in. Let the breeders make their first business to improve their stock and show its real value at the fairs to teach the farmers how much money can be made by using a pure-bred bull in their herds.

This is the great point. The use of Short-horn and Hereford bulls in the great Western pastures has more than doubled the value of the herds for beef, and when a farmer is inclined to scorn a Short-horn cow because she is no milker, he must remember that her business in the world is to produce beef. And so the lean, light, bony, eat-hummed Jersey's business is to make the best of butter, and that of the bulls to cross on our common cows and double the value of every heifer calf.

PROFITABLE CATTLE FEEDING.

WALDO F. BROWN.

Advantages of Spring over Fall and Winter Feeding.

IN a former article I spoke of the comparative profits of Winter and Spring feeding of cattle, and now by request of the editor I will

give some facts and figures showing what my Illinois friend has done. But, first, let me repeat the points which I claim in favor of Spring feeding, for they are of so much importance that they will bear repetition. 1st. The feeder who buys cattle the first of March for feeding, can usually buy as low (often lower) than if he bought three or four months earlier. 2nd. Cattle bought at this season will not shrink in weight at all, but will at once begin to gain, while cattle bought in early Fall will often lose 100 pounds or more in the transition from grass to dry feed. 3rd. Cattle fed at this season of the year will come into market ahead of grass beef, when good cattle are scarce, and the price high, two or three weeks often making a difference of from 50 cents to $1 per hundred in price. 4th, and most important of all, cattle that have been fed before going on grass long enough to give them a thrifty start, will make the greatest possible gain, as all the conditions are favorable—water is abundant and pure; there are no flies; the pasture is fresh and abundant, and if the cattle are to be sold in June, the pasture may be stocked twice as heavily as if they are to be fed all Summer.

But I will give the experience of Mr. Deal, of McLean Co., Ill. He had been feeding cattle through the Winter, and selling them before grass time in the Spring and found no profit in it, and in the Spring of 1877 he concluded to try a new plan. He put 55 steers in the feed lots on the 17th of February, and began light feeding, but got them on full feed before the end of March. He fed a peck of corn to each per day after they were turned to pasture, and sold them in 129 days from the beginning of feeding. His cattle averaged 1,010 pounds when put up to feed, and 1,429 pounds when sold, making a gain of 419 pounds each, or about 3¼ pounds per day each. These cattle ate 1,500 bushels of corn, or about 27 bushels apiece, and, although I have now mislaid the figures, I think they paid over 60 cents per bushel for the corn.

The next year Mr. Deal fed 64 head of steers. He began feeding in February with cattle that were quite thin in flesh and averaged 1,000 pounds. They were worth $3.50 per 100, or $35 each. They were fed lightly till the first of April, and from that time till put on grass they were fed all the shock corn they would eat clean. When turned on pasture feed boxes were provided and they were fed one peck of ear corn each per day. These cattle were kept until August, as they continued to gain well, and when sold averaged 1,536 pounds, and brought $4.50 per 100 or $69.12 per head. After allowing $1.25 per month for pasture and corn—the regular price at which it could be bought—and eight per cent. interest on the money invested, it leaves for labor and as profit on the money invested, $1,115.68.

My own experience in feeding cattle, although limited, fully confirms Mr. Deal's idea that Spring feeding will give a profit when Fall and Winter feeding will result in loss, for it seems that Spring is the natural period of growth in the animal as well as in the vegetable world, and it is by careful watching and taking advantage of these favoring circumstances that we get the greatest profit. It is absolutely necessary that the stock should be fed grain long enough before going on grass so as to give them a start. I should be very much pleased if many of the readers of the RURAL would try this plan next Spring, if only with a single animal. Weigh your animal the first or middle of March, when you begin feeding grain, and make a note of its condition, as to whether it is in low or moderate flesh. Weigh again when you turn it to grass, and a third time in a month. Measure or—what is better—weigh, all grain or meal fed and then send us the report. It will be read by all farmers with interest and profit.

Butler Co., Ohio.

The Swine-Herd.

SWINE JOTTINGS AT KIRBY HOMESTEAD.

THERE is nothing like a pasture for breeding sows to run in. All of our sows which lost their pigs last Spring while confined in pens, have had large litters of fine, strong pigs. They had nothing to eat but Orchard Grass and clover, and helped themselves to spring water in the field. They slept under the trees and by the side of the fences, and were let alone until a few days before pigging, when they were put into a pen and given a little straw for a bed. One had her little family under a tree, and did well. If the field was large enough and the weather was good, sows might safely be left out for the young to be born.

THE hot sun is injurious to young pigs and blisters their delicate skin. This gives them a stunt and is apt to make them grow crooked. A rain-storm and a damp bed are liable to give the mother a cold and milk fever; hence we prefer to house the mothers before the young ones are born. A young pig would make a good meal for a fox, and when safely indoors they can be looked after with less trouble.

A SUDDEN change from grass to solid food is not healthful. It will make fever just at a time when it must be avoided. On this account we make the change gradually, and give the sows green corn-stalks, apples, or some sort of vegetables with the solid food. Avoid corn and corn-meal as much as possible, as they are the worst food a sow with young pigs can have. Wheat middlings is the best.

THE udders and nipples should be examined before yeaning, and if they are dirty they should be washed clean. If the sow is tame

SHROPSHIRE RAM, DUDMASTON HERO—FIG. 476.

this can be done with a sponge; and if not, with a broom dipped in a pail of water. If any of the nipples are cracked or sore—and this is often the case—they should be smeared with oil and healed up before the young pigs are put to nurse, or else the sow will be restless and either lie on them or tread on them. When the nipples are sore, a sow may be ferocious and attack the young ones and eat them up, as she imagines that they are the cause of the pain. Briars will scratch the udders and make them sore, and lying in the mud will poison them and cause them to crack.

WHEN there is a scanty supply of milk from the mother, little pigs may be taught to go into a separate pen and drink milk from a shallow vessel. They should be put by the vessel with their fore-feet in it, when they will smell the milk and soon begin to drink. The vessel and milk should be warmed before the experiment is tried. If the sow is cross or irritable, the pigs can be quietly pushed into the adjoining pen with a long stick, and so avoid any excitement. They can also be moved around and into the vessel in the same manner without being frightened, when they will be more likely to drink. A seared pig won't drink, neither will it if the mother is making a fuss.

PIGS are scarce and high all over the country. Care will pay. F. D. CURTIS.

Farm Economy.

THE MASSACHUSETTS LAW OF TRESPASS.

PROFESSOR F. H. STORER.

THE remarks on page 488 of the RURAL, as to the necessity of legislation for the protection of farmers living near towns and cities from the depredations of excursionists, are borne out by the Massachusetts act, which declares that:

"Whoever, between the first day of April and the first day of December wilfully enters on or passes over or remains on any orchard, garden, mowing land, or other improved or inclosed land of another, after being forbidden by the owner or occupant thereof, or by the authorized agent of said owner or occupant, either personally or by notice posted conspicuously on the premises, shall be guilty of trespass, and shall be punished by fine not exceeding twenty dollars; and such fine shall not be less than five dollars, if the offence is committed on the Lord's Day.

A person found in the act of committing the trespass described in the preceding section, may be apprehended by the Sheriff, Deputy Sheriff, Constable, Watchman, or Police officer, without a written warrant, and kept in custody in a convenient place not more than 24 hours, Sundays excepted; at or before the expiration of which time he shall be brought before a trial justice, police, municipal, or district court and proceeded against according to law, or discharged as the magistrate or court shall determine."

It has been sufficiently illustrated by European experience that in proportion as a country becomes densely populated, special pains must be taken to insure to the owners of crops, cattle and lands some small share of the privacy and quiet which are essential to their happiness and success. The Massachusetts law is manifestly a step in the right direction, and it is important as evincing a just recognition of some of the rights of landholders. But it is extremely doubtful whether the difficulties which the act seeks to do away with can be cured by legislative enactments alone, since no inconsiderable part of the annoyance and even of the actual loss to which suburban farmers are exposed, depends upon pure ignorance and not upon malice. The average city child, or adult, even, has absolutely no conception that it is wrong to walk through standing grass, for example, and it is not at all easy to convince him that "shooing" at cows is an act at which anyone may justly take offence. The notion that animals may be disturbed by crossing their pastures would, of itself, never have occurred to him, for he does not reflect that actual molestations by previous visitors may have made the animals fearful and uneasy. He is, in general, blissfully unconscious of the fact that his movements and those of his fellows are of the same order as the constant dropping which wears the stone, and he fails to realize that the "harmless" thing he may be doing has been already done over and over again, with manifold variations, by others; and that it will not fail to be continued by his successors. Still, the general diffusion of the knowledge that there is a $20 fine for trespassing must work powerfully to hinder unconscious as well as conscious faults.

It is probable anyway, that it will be easier for the farmer to keep city children out of his mowing fields than for the suburban resident to guard his little lawn and borders against the over-grown boys "from up country" who have come down to serve his grocer, his milkman, and his provision dealer. Ten to one that each new grocer's boy, on his appearance, will drive over or walk over some cherished bit of grass, with as little compunction as if he were in his father's dooryard, and that he will continue to offend for a considerable season. Incessant expostulation—judicious and injudicious, in season and out of season—seems to be the only known palliative for this most unnecessary annoyance. No certain cure for it has yet been discovered; and it is noticeable that the country-bred boy has even a fainter conception than his city cousin of the difficulty of making anything grow that is exposed to constant contact with humanity.

It would be well, undoubtedly, in populous neighborhoods, if people could acquire the habit of keeping off private land on all occasions. But, in the vicinity of Boston, at least, there is one circumstance well calculated to hinder this most desirable consummation. According to the Massachusetts system, the farm lands in a township, as well as the shops and dwellings at the centers of business, are taxed for the creation and support of water-works, systems of sewerage, police, the sweeping, paving and lighting of streets, and all the multifarious necessities which are incident to the crowded population which exists at the central city, town, or village. At the same time, the farms are "valued," not on a basis of what they produce, but on some more or less wild estimate of what the land could be sold for to speculative builders. There is apt to be considerable uncertainty, withal, as to how rapidly the rates of taxation and of valuation may be increased. In consequence of this most absurd condition of things, few people can afford to cultivate mediocre land in the vicinity of the city, and it happens that very considerable masses of land are left idle; or, at the best, the standing grass, such as can grow without any care or manure, is sold once a year at auction. But the existence of such uncared-for land, over which anyone may, practically, roam at his pleasure, tends naturally to bring all landed property into contempt; and it will not be easy to teach people to respect mowing fields and pastures in Massachusetts until this particular anomaly has been done away with. The example of Connecticut, which has sought to protect farmlands from unjust and burdensome taxation, might well be followed in the parent State.

Sheep Husbandry.

OUR ANIMAL PORTRAITS.

Dudmaston Hero.

FOR years the Shropshire Sheep have held a very high position in England both for the excellence of their fleeces and the superior quality of their meat which in some flocks, notably that of the late Marquis of Anglesea is more like venison than mutton. However, their popularity has been rapidly growing and the present high value set upon the best of them may be inferred from the fact that last year the subject of the accompanying illustration, Dudmaston Hero, was hired for 160, guineas or $813, while a couple of weeks ago he was sold, as a two-shear, at 200 guineas, or $1,016. With him his late owner, Mr. Mansell, won the first premium at the late Royal Show at Derby.

THE SHROPSHIRE SHEEP.

HENRY STEWART.

ONE of the most successful instances of cross-breeding sheep is the Shropshire. It presents itself just now in a pertinent and timely manner to those shepherds who are looking out for an excellent ram for breeding lambs or grade sheep for mutton and medium wool. For early market lambs there is no better stock ram than the Shropshire, for its lambs are stocky, hardy, fat, good feeders, of good size, and carry the so-much-desired smutty faces and legs. For mutton for domestic use or for the butcher, the half-bred Shropshire equals the South Down cross in quality, and it excels it in size and early maturity; while the fleece is heavier and of longer wool than that of the South Down, and equally available and desirable for the country carding mill or for the wool buyer. It rivals the South Down and the Cotswold, and for the farmer's use it surpasses either. This quality, which is by no means inconsiderable, it derives from its parentage, which is made up of both of these excellent breeds, with a foundation of a hardy, long-established breed, known as "Morfe-Common" sheep.

This original parent was a fine, short-wool sheep, horned and black-faced, which was kept on a large tract of land known as Morfe Common in England. It was very hardy and thrifty, and as long ago as 1792 became the chosen material upon which to found a series of improvements, by some of the shrewdest and most enterprising breeders of that enterprising period. The Cotswold was the first improved breed used, and after a good mixture had been procured the South Down was used. In fact, the original sheep was about bred out entirely, being used chiefly as a vehicle for combining the blood of the Cotswold and South Down, and the result was the Shropshire, which is for all purposes and to all appearance a cross of these two breeds. It is an enlarged South Down with longer and heavier fleece, retaining the fineness, compactness and rotundity of this breed, mingled with the larger frame, and longer, looser and more open fleece of the Cotswold.

The Shropshire has been very carefully bred and continually improved during the long period which has elapsed since its foundation; and, notwithstanding that fashions change and the exigencies of the business of breeding require a constant accession of novelties, it has retained its position in England as a popular farmer's sheep. The "rent-payer" is a frequent title given it to distinguish it as a safe and trustworthy source of the most important part of the profits of a mixed farm, in which the production of mutton and lambs has a very large share.

But we have far more to do with the question of its adaptability for American agriculture than with its popularity in other countries. It is well that a breed of sheep should come to us with "the highest references" and most encouraging testimonials. But we want to know what place it will fill upon our farms. This question has fortunately been satisfactorily settled. The Shropshire has been tried from the Atlantic to the Pacific shores, in Canada, in Georgia, in Tennessee, in Mississippi and in Texas, and has failed nowhere. Upon mountains and upon plains; in the most luxuriant pastures, and with but sparse and scanty vegetation: with the wealthy amateur, and the working, practical farmer, it has never gone back upon its friends. The appearance of the sheep is good and even attractive. They have the look of solid, hearty, contented sheep, and with only moderately good care have proved hardy and easily acclimated. As a rule, our sheep have to rough it, and are never—or hardly ever—coddled and petted; and on this account the less hardy kinds usually come to grief in a short time. The Shropshire, however, holds its own with the Merino and the "iron-clad" natives. But no American farmer will find money in or out of a flock of pure Shropshires, and few will do so even with our own native American Merino. These sheep are profitable, first, to the breeder who raises rams for the supply of the farmers, and second, to the farmers for the production of grade lambs and mutton sheep only, and this is a profitable and secure business. It is not an El Dorado exactly, but it pays better than money in bonds and mortgages and is equally

as safe, always providing that the owner of the flock will give as much care to his sheep as he would to his bonds. For at three months old a half-bred Shropshire will easily weigh 50 pounds, and at two years it will yield to the butcher a carcass of 100 to 120 pounds, and to the owner a yearly fleece of seven pounds of easily marketable wool. Its close fleece enables it to resist storms and rain and snow, and its thrifty habits and good feeding qualities make it easily kept and cheaply fed. And what more can a sheep do for its owner than this?

Miscellaneous.

What Others Say.

THE English Live Stock Journal says the most unfortunate thing about wool, in respect to the farmer, is that it will keep. It thinks a time's price the best in the long run, and that there's a great deal of truth in the old country-side saying, "A man seldom regrets selling." Two years' wool crops are thought to be held now in England; but that matters comparatively little with markets, for as America rules the wheat markets of the world, so does Australia rule its wool markets. . . . . Owing to the lateness of harvest weather many English farmers have made "Australian oat hay" of their oat crop—a splendid feed for horses, who relish it exceedingly, as all the nutriment is retained in the straw. . . . . Sewer farming, on which the late Mr. Mechi used to wax eloquent, is again attracting considerable attention in England, nearly half of which could be amply fertilized by the sewage of London alone, if properly distributed. The great danger, Dr. Gabb says, is over-sewage of the land to which it is possible to conduct the sewage under present arrangements. Precipitation is the system advocated as being the only effective one.

PLANTING HARDY CATALPAS.—C. speciosa.—Speaking of the hardy catalpa, C. speciosa, that accomplished young horticulturist, William Falconer, says in the Cultivator (Albany) that they should be planted very thickly and thinned out in after years as they begin to crowd one another. They may grow one to four feet high the first year after being set out, but here do not let your ambition curb your common sense. Instead of letting them remain as they have grown, cut them down to within an inch or two of the ground. This you can do easily (as the young wood is soft and pithy) with a scythe as you would a field of thistles. Next year they will shoot up young rods doubly strong and long. Again, in succeeding years, fail not to cut back unscrupulously such plants as show a weakly growth. The reason is this: If you let them grow from the beginning unchecked, the second season, instead of throwing out a strong, straight shoot, they will branch out, and thus destroy their value as clean, straight-stemmed timber trees. And here, too, thick planting becomes reasonable. If planted thinly, a branchy disposition will be natural: if thickly, they are compelled to grow up straight. As they advance in years and growth, chop out the scraggy plants and those that overcrowd their better neighbors, and with a keen-edged knife remove all wayward branches.

RAMIE FIBER MACHINE.—The New Orleans Democrat announces the successful operation of a new machine for extracting ramie fiber. Says the Sun: The ramie plant can be raised in almost unlimited quantities in the Southern States, but heretofore the difficulty of extracting the fiber has been a serious impediment to its extensive culture, and if, as has been announced, machinery can be successfully employed for this purpose, ramie cultivation may become even more profitable than cotton culture. We can only hope that the above announcement will be fully substantiated.

DR. LEADY of Philadelphia believes that the Mosaic prohibition of pork was due to the danger of trichinosis in a country where fuel was scanty, and therefore the food seldom well cooked. He also thinks that millions may have died of trichinosis in centuries before the true source of the danger was discovered, and that many of the deaths which occurred in the army during our civil war were due to the frequent use of raw and badly cooked pork, although ascribed to typhoid, rheumatic, or malarial fevers.

The father of the cereals is Pop Corn.—Vanity Fair relic. . . . . "Bull Run" Russell, who has been traveling through the country with the Duke of Sutherland's party, was asked the other day what impression he had formed of America, and replied very frankly: "Where you can't raise wheat you raise gold, and where you can't raise gold you raise lead, and where you can't raise lead you raise silver. It's something everywhere—a country of wonderful resources." . . . . . The universal heart of a man blesses flowers. He has wreathed them around the cradle, the marriage altar, and the tomb. . . . . Even if a man has two lawns, he generally wants a lawn mower.—Detroit Chaff.

A SKULL is a natural receptacle for brains, but there are men who make you feel that Nature made the hole and then forgot to fill it up.—N. Y. Herald. . . . . The following remarks from Popular Science Monthly, are particularly commended to farmers who read much by candle light: A book of 500 pages, 40 lines to the page and 50 letters to the line, contains 1,000,000 letters, all of which the eye has to take in, identify, and combine each with its neighbor. Yet many a reader will go through such a book in a day. The task is one he would shrink from if he should measure it beforehand. The best position and light, clear type, plain inks, with the best paper of yellowish tints, and abundant space between the lines, afford the best safeguards against harm.

Everywhere.

RURAL SPECIAL REPORTS.

California.

NORWALK, Los Angeles Co., Sept. 8.—The resources of this county are many. Wheat, barley and corn are grown, the two first extensively. Fruit of all kinds does well, including many tropical varieties. I planted the White Elephant Potato, which weighed two ounces, and have just dug 33 pounds of fine tubers, 25 of them weighing 20 pounds. Washington Oats came too late for this climate. Crops of all kinds fair to good; fruit, very good. H. P. S.

Connecticut.

STRATFORD, Fairfield Co., Sept. 12.—I send you some specimens of the pinks raised from the RURAL seeds, and they are considered very fine by parties that have seen them. My Sorghum is nine feet high. Will the Rural Dent Corn ripen with me, or is the season long enough for it here? X.—[We are greatly obliged to our friend for the bouquet, which, for out-of-door pinks is the prettiest and most varied of any we have ever seen. There are several flowers so beautifully marked that the seeds should be carefully saved. We are a little surprised that the Rural Branching Sorghum should grow to such a hight in Connecticut. We hope that some of the plants have been cut back and that we shall be favored with a report as to the second growth. We cannot say positively, but we *think* that the Rural Dent would ripen with you unless the season should prove unfavorable.—EDS.]

Illinois.

KANKAKEE, Kankakee Co., Sept. 16.—A drought beginning early in July and extending through August cut our crops short. Spring wheat very little sown in this county; Winter wheat, about 15 bushels per acre; rye, 15 to 25; oats, 35 to 50. Grass a fair crop; but corn and potatoes light—late potatoes a failure. I experimented with six varieties this season: the White Elephant I cut to ten eyes, planted in five hills and had five pounds of good-sized tubers. The Beauty of Hebron, Snowflake and Burbank's Seedling yielded well for the season—about the same in quality and quantity. Patent Office No. 2, is also a very good potato and yielded about the same as the three other named varieties: it has a deeper eye than either of the others. I also planted the White Peachblow, but it being a late potato, the drought with the bugs completely ruined it. The Washington Oats I planted on garden soil that was too rich; they lodged before heading out and were a failure. Corn is selling here for 55 cents per bushel; oats, 35c.; wheat, $1.20; rye, $1; hay, Timothy, $10; prairie, $6; potatoes, $1.20. J. M.

Michigan.

HILLSDALE, Hillsdale Co., Sept. 14.—The White Elephant Potato weighed four ounces. It was cut into 16 pieces and one eye dropped in a place 18 inches apart in the row—Sept. 1, we dug 30 pounds of clean, good looking potatoes—mostly above average size. The seed was planted on rather heavy, loamy garden soil without fertilizer except plaster with Paris-green once. The ground was hoed four times. The tops grew strong and thrifty and seemed little disturbed by the bugs. Only about one-third of the Sorghum seed grew. It is just ready to tassel and about nine feet high. The average of stalks to the plant is eight or ten. The Washington Oats grew rank straw but were so smutty as to be scarcely worth harvesting. The wheat crop in this locality was not much better than one-third of the average. Corn is good, but it is being hurt by the dry weather. It is probably over half cut up. Potatoes light. Oats middling. Hay, ditto. Clover seed promises very well; reports are current of eight bushels per acre of the large kind. Stock of all kinds is high—sheep, $3.00 to $3.50; calves, $8 to $10—large shipments of both going West. C. L. B.

PONTIAC, Oakland Co., September 16.—The W. E. was cut into nine pieces with an eye in each, and planted in a loamy soil. Seven pieces grew and yielded 19½ pounds. The W. Oats were drilled on clay; no tending except with the cultivator; yield 9½ pounds. R. B. Sorghum has not done well owing to the dry weather. No rain in four months to amount to anything. I am well pleased with the seeds, etc., and would not take five dollars for the seed I have had from the W. E. and W. Oats. Am quite interested in the strife for excellence with plants and seeds, and think the RURAL the best farm paper I ever read. C.

Minnesota.

ST. PAUL, Ramsey Co., Sept. 13.—The culture of flax for seed alone is getting to be an important interest in this State. The acreage for 1881 is 90,494, against 40,004 in 1880, and 12,966 in 1879. The number of bushels raised in 1880 was 397,190, against 99,378 in 1879. The returns of production for 1881 have not yet come in. This Chamber (Chamber of Commerce) is endeavoring to put the farmers in the way of utilizing the fiber now wasted. F. A. F.

New York.

AUBURN, Cayuga Co., Sept. 12.—On May 1, I received by mail a battered and ragged package, which, on opening, I found to consist of a broken paper box, a handbill with great letters, "White Elephant," and in the midst of all one little potato about as large as a Bantam hen's egg. I put it on my P. O. scale and found it brought down just three half ounces; the postage on potato, box, handbill and all was two cents, or pay for two ounces. Surely, thinks I, Barnum has not got the only "Baby Elephant" in this country. On examination I discovered three well-marked, distinct eyes, and one little depression or blind eye. I cut the potato into four pieces with an eye on each. They were about as large as a good-sized acorn each. I spaded up at good depth a space in my garden, and mixing thoroughly with the earth about a tablespoonful of soluble Pacific Guano for each piece, I planted them in a square of about 12 inches, one piece in each corner. The three good eyes soon came up and grew 8 or 10 inches in hight before the blind eye appeared, but they all grew and flourished with a great wealth of haulm. Now as to result—I dug them a few days ago and I have 12 fine, full-sized tubers, smooth, white and fair. On my P. O. scale they weigh as follows: One weighs 11 ounces; one 10 ounces; two, nine ounces each; two, eight ounces each, and so on, the the whole crop from three half ounces is plump weight of 80 ounces, or five pounds. This is pretty good—don't you think so? H. D. W.

CARTHAGE, Jefferson Co., Sept. 10.—The counties of Jefferson and Lewis are the scene of terrible devastation by fire. A circuit of 20 miles is desolated; crops, houses, barns, implements and nearly everything have fallen before the flames. The earnings of a long lifetime are swept away in an instant from many who were lately rejoicing in them. Apples are roasted upon the trees, potatoes are baked in the ground, cattle are panting for breath, and everything seems to be going up in smoke. The corduroy roads are burning and bridges are smouldering in ruins; skeletons of wagons may be seen along the roads, the flames coming so rapidly as not to give time even for the removal of wagons and carriages. Almost the whole population has been out fighting fire, but their efforts availed but little. There has been no rain in this region for over two months, and still the parched skies withhold their blessings. As yet no correct estimate of the losses can be given, but it is thought that the damage to forests and woodlands alone will be over $200,000, and much soil will be rendered absolutely worthless by reason of burning down to the rock beneath. Add to this the damage done to buildings, crops, stock, etc., and the amount will be enormous. The insurance on property is very slight. Some lives have been lost. We are in sore distress and much aid will be needed by the suffering people. H. R. T.

GLENS FALLS, Warren Co., Sept. 10.—The apple crop is a complete failure. There is a medium amount of fruit, but it is riddled through and through by a little semi-transparent worm scarcely visible to the naked eye; also many kinds are affected with small, dry rot specks. They are mostly near the outer portion of the apple, though some penetrate to the core. Pears are better, but more affected with the rot than usual, and are rather tasteless. Plums are plenty, but ripen unevenly and are insipid. Grapes made a fair show, but as they begin to ripen we find that they have not their usual sprightly taste. E. W. K.

OAKFIELD, Genesee Co., Sept. 15.—To-day I mail to the RURAL office one head of the Washington Oats which, I think, will beat anything of the kind ever seen there. It is one of five that grew from one seed on land that has been cultivated over 40 years without any manure except what a clover sod has made. They grew about five feet high and there were from four to eleven stalks from one seed. I counted the oats from one seed, they numbered 922. After being thrashed and cleaned they filled a half bushel even full and weighed 20½ pounds. [We count upon the panicle 255 spikelets. The oats are unusually large.—EDS.] From eleven White Elephant eyes I obtained 61 good-sized potatoes. I think they will yield better than any I have ever raised. There is but little of the R. B. Sorghum that is over three feet high; it appears to stand the drought well, but requires too much weeding to make it a profitable crop for fodder. J. F.

Ohio.

CHIPPEWA LAKE, Medina Co., Sept. 12.—I raised 20½ pounds of tubers from the White Elephant, and five pounds of W. Oats. The RURAL is the best paper in world. J. E. K.

NEW LONDON, Huron Co., Sept. 12.—We have had quite a drought and pastures in some places are bare and dry. Our heavy rains the first of June prevented working corn when it should have been done; but, notwithstanding this and the dry weather, there is much more good fair corn than we thought possible for a while. Potatoes are the shortest crop of all. The White Elephant started out finely but the dry weather and intense heat caused them to wither and ripen prematurely. I have dug all but one hill which is green and trying to come out ahead. It did not start with the other six hills which accounts for its yet being green. I had rather over a peck of medium-sized tubers. Hope to get a fair showing another year. This makes the third year my Beauty of Hebron has had "*up hill*" work, but I know enough of it to believe I may say it is among the best potatoes raised. The Washington Oats were badly eaten back by my turkeys, so were late and rusted badly, but I have saved what there was and shall give them another trial. The Ennobled Oats are cast aside as nothing more or less than the old Norway, or at least a complete counterpart of them. The Sorghum we did not try, as we have that which we value much higher—a large sugar-maple orchard. I raised the Golden Mangel last year from the seed sent and must say they would grow enormous crops here in our soil, but I have my doubts if they would pay where we can raise such good crops of corn, oats and hay for our stock, yet I have raised seed this year and think of trying them another season. In conclusion, I must say I think the readers of the progressive old RURAL owe it a debt of *heartfelt* gratitude, but like all spoiled children, we clamor for more. BUCKEYE.

Pennsylvania.

SHEAKLEYVILLE, Mercer Co., Sept. 17.—The Washington Oats—about one ounce—I drilled in rows about 14 inches apart and had ten of those rows 42 feet long, or one continuous row of 420 feet. I harvested 21 pounds or rather I saved that amount, as the birds began to cut them off as soon as they began to color, and when I cut from one to two quarts were lying on the ground and how many the birds carried away I can't tell. The soil was of medium quality; they grew about 4¼ feet high and the stalks were very heavy. The White Elephant Potato I cut into nine pieces, planted and cultivated them in the usual way and dug 75 averaged-sized tubers. It has been very dry in this section and the potato crop and also corn and buckwheat have been nearly a failure. The asparagus is growing and doing well, considering the season. The Sorghum was a complete failure; it did not grow. The flower seeds my wife took charge of as she is a lover of flowers and they grew nicely and are beautiful. H. C. C.

SPARTANSBURG, Crawford Co., Sept. 12.—From the White Elephant Potato I obtained 30 nice potatoes and 15 small ones—a large yield. The Washington Oats were sown late. Something ate some of them; we had left three quarts. The straw was heavier than that of our English oats. The Rural Branching Sorghum is nice and green yet, while the corn is drying; it measures six feet four inches; no sign of seed. The asparagus came up and is doing well. The pinks I sowed in a hot-bed and tended carefully. They are nothing uncommon, but they are pretty and in blossom yet. We have had terribly dry weather here. E. A. B.

Vermont.

MONTPELIER, Washington Co., Sept. 11.—The White Elephant Potato I planted May 5, and had 10 hills. I dug them Sept. 7 and had 108 tubers, weighing 43½ pounds. Six of them weighed 6¾ pounds, and would [illegible] inches in length. The ground was manured with barnyard manure, and then I mixed a handful of plaster with the soil in each hill before planting, and after the vines were four or five inches tall I mixed another handful around the top of each hill. I hoed them twice, and kept the bugs off by hand-picking.

All my neighbors who have seen the potato say it is the biggest yielder they have ever heard of. The other seeds did not do well. The R. B. Sorghum did not come up, and the Washington Oats rusted badly. The asparagus seed came up well and is doing middling well now. I would not take twice what the paper cost me for the potatoes. The RURAL is the best agricultural paper that I have ever read. W. D. H.

WALLINGFORD, Rutland Co.—The White Elephant I planted May 12, cut into 15 pieces, making 15 hills, which were dug September 3, and yielded by actual weight 64 pounds. Some tubers weighed two pounds each. We find them to be of excellent quality. The mammoth asparagus now stands two feet high. The Branching Sorghum seed did not germinate. The Washington Oats proved to be no better than my old variety. H. H.

West Virginia.

SHEPHERDSTOWN, Jefferson Co.—Owing to an arctic Winter, wheat will not average over half a crop in the county, and there has not been rain to the amount of a good dew since August 7. Corn will not make half a crop. There is a prospect of the market starting at $1 per bushel for the new crop. Apples a fair crop. No peaches. J. T. H.

Wisconsin.

ELROY, Juneau Co., Sept. 10.—I have this day dug the White Elephant Potato planted May 16, in 15 hills, one eye to the hill. White Elephant yield 57 pounds; Burbank's (same manner, 15 hills), 53 pounds; Snowflake (same manner, 15 hills), 49 pounds; Early Ohio (same manner, 15 hills), 23 pounds. I am fully convinced that one or two eyes to the hill will yield larger potatoes and more pounds than whole potatoes. E. E. B.

The Queries.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

GRASS FOR A SMALL DAIRY.

R. D. B., Danbury, Conn., asks what kind of grass can he sow this Fall, that he can mow several times next Spring and Summer for cows in the stable. Would Orchard Grass or Alfalfa be suitable? The drought thereabouts has been very severe, and cows have fallen off greatly in their yield of milk which is therefore in great demand; some farmers have fodder corn, but few have enough and our friend says that it would be a great advantage if ensilage could be put up in silos small enough to hold a supply for only half a dozen cows.

ANS.—There is no meadow grass, so called, that our correspondent can sow this Fall to be cut several times next Spring and Summer; but he can sow a member of the grass family—winter rye, which he may cut several times as green food for his cows. Rye is a soiling crop much used. His land would probably bear a strong crop of rye, and it furnishes the earliest cutting in Spring. It cannot be cut several times unless care is taken to cut before the head appears. If it makes a strong growth in the Fall, it may be lightly pastured to prevent smothering under snow. If the ground is dry and an early cutting is not desired, it may be lightly pastured early in Spring, and it will thicken up at bottom and yield a heavier cutting. In Germany, sheep have sometimes been passed over it between the hurdles five and six times during the season, and it has then matured a crop the following year. In this case it is eaten off when six or eight inches high and before the seed head has commenced, and it springs up again at once like clover.

Orchard Grass is very valuable when once established, may be cut several times in a season with sufficient rainfall, and is one of the best grasses for springing up at once after cutting. The writer has measured a growth of one-and-a-half inch the first 24 hours after cutting. But this grass often starts poorly the first year, and takes two years to get well established, but then we have known it to produce good crops for 20 years in a stiff clay loam. Two bushels of seed are required per acre, and it may be sown upon the Winter rye early in Spring. The price is about $2.75 per bushel, weight about 14 pounds per bushel.

Lucerne or Alfalfa also does well on fine, rich loams; it is feeble for a year or so, but when well established, it yields large crops. It roots deep, and in California is very highly esteemed as a dairy food—in fact, it is the great reliance for butter production in some parts of the State. It is somewhat richer in albuminoids than Orchard Grass. It has been grown but little in the Eastern and Middle States. It requires a deep, rich soil. About 15 pounds are sown to the acre, and it costs here 15 cents per pound. All these seeds can be had from seedsmen who advertise in the RURAL.

Such a sweeping drought as we have had over almost the whole country cannot well be provided for in green crops to be cut as wanted. But R. D. B., if he chooses, may adopt the ensilage system with an assurance of providing for any drought that may come. This system may be used for large or small operations. It is quite as applicable for six cows as for fifty. A silo for six cows would require to be 12 feet wide, 20 feet long and 14 feet deep, holding, under proper presure, about 72 tons of green corn, grass or any green fodder crop. This silo may be built for $100, including the roof, if the farmer does some of the work himself. A silo of this size will keep the ensilage as well as a larger one, and its whole cost might be paid in the extra milk produced in a season like this. But let every one abandon the idea of adopting ensilage simply to preserve green corn. Give the system its true significance—a method of preserving for future use all our grasses and other succulent forage crops. The silo should turn out as great a variety of grasses as an old meadow. Practical ensilage which shall ever establish itself in this intensely utilitarian country, must furnish as complete a ration for all purposes of animal growth, and the production of milk, as can be had in pasturage. A variety of grasses may be ensilaged as well as a variety of grasses cured and put in mow. A silo may be filled early in June with Winter rye and Red Clover. A little later it may be filled with all the varieties of meadow grasses. In September it may be filled with green corn, second-crop clover, millet or Hungarian Grass. The early ensilage will carry the stock through the Summer and through drought, and the later ensilage will rejoice the cows in Winter.

DRILLING WITH THREE HORSES ABREAST.

G. S. S., address mislaid, asks, 1, for a diagram showing how to hitch three horses abreast to a drill for sowing fertilizers; the tongue he says is the bother; 2, would it hurt wheat if one of the horses tramp on it when sown.

ANS.—S. cannot drive three horses abreast on a tongue. The tongue on the drill must be replaced with two tongues, or a pair of thils. The middle horse must be in the thills and two neck yokes should be used instead of one. The middle horse takes one end of both neck yokes. Take two light tongues; place them 16 inches on each side of the center of the present tongue-frame on a crossbar between the two tongues where the bolt for the evener comes in the drill tongue. These thills or tongues are easily fastened to the cross-pieces of the drill in the same way as the tongue now is. Let the thills be about six inches longer than the tongue, to provide for the extra room for the the three-horse whiffletrees. The diagram, Fig. 477, will illustrate the whiffletrees. The writer has used them for some fifteen years, and regards them as, perhaps, the most completely balanced form yet devised. The horses are exactly on a line or abreast of each other. The three single whiffletrees hang as evenly as do the two single whiffletrees for two horses. The singletrees are 26 inches long. It will be seen how the middle, or balancing, trees operate to place each horse on an equality. This form of three-horse trees is appropriate for plowing, hauling logs or stones, drawing loads upon a wagon, or for any purpose for which the strength of three horses may be required. The use of the third horse is a great economy in draft. Three horses well balanced and drawing evenly together, will draw as large a load as four horses in two pairs, one placed ahead of the other. A double tongue or thills on a wagon and a three-horse team is an economical power for hauling heavy loads to market. Two tons may be hauled with such a team as easily as one ton by two horses. The third horse may be considered as drawing altogether on the load. But we do not think more than two horses, of fair strength, are required on a drill even when using the fertilizer attachment, unless the drill sows wider than usual. A twelve-tube drill would require three horses to draw it comfortably. 2. It would not injure the wheat for the off horse to travel on the sown part. Wheat is the better for rolling or compressing the soil over the seed.

GROUND LIMESTONE AND LIME.

W. S. H., Ursina, Pa., and G. L., La Salle, Ill., both inquire as to the fertilizing value of ground limestone, and how best to utilize it for enriching good land in one case and poor land in the other.

ANS.—Raw limestone, ground or unground, is carbonate of lime, consisting of lime and carbonic acid. In the process of burning the carbonic acid is expelled and the oxide of lime remains. The change in composition causes also a change in properties. Limestone, or carbonate of lime, is *mild* in its alkaline properties, while burnt lime is *caustic*. When exposed to the air it absorbs moisture and crumbles, and is then called air-slaked lime; when mixed with water it absorbs about one-third its own weight and becomes hydrate of lime or the ordinary slaked lime of builders, etc. If exposed to the air for a long time, however, it again becomes carbonate of lime after it has absorbed its full supply of carbonic acid. Applied to the soil, it is a powerful agent in decomposing the inert and inactive vegetable matter in it, making them available for plant food. Moreover, it also acts on the compound silicates of the soil, such as silicates of potash and so on, liberating the potash, an essential element of plant food and one that is seldom found in large quantities in the soil in a soluble form, and is therefore soon exhausted. On poor soils, especially those poor in vegetable matter, the good effects of lime are small; it is on rich soils that its action is most beneficial, because it is in these that the materials for it to act upon are most abundant. Its activity is vastly greater than that of carbonate of lime, or raw limestone, however finely ground this may be. Powdered limestone is of very little value to the soil beyond furnishing one of the essential elements of plant food, which is generally abundant in the soil naturally. If applied in large quantities it may, too, alter the soil physically, but its action is slow and feeble. We would not, therefore, advise the use of ground limestone except where the soil is destitute of lime in sufficient quantity to supply what is needed for plant food, and this is very rarely the case. The finer it is then divided the better, but even then lime would generally be more efficacious. On poor, sandy soil its application has been found beneficial.

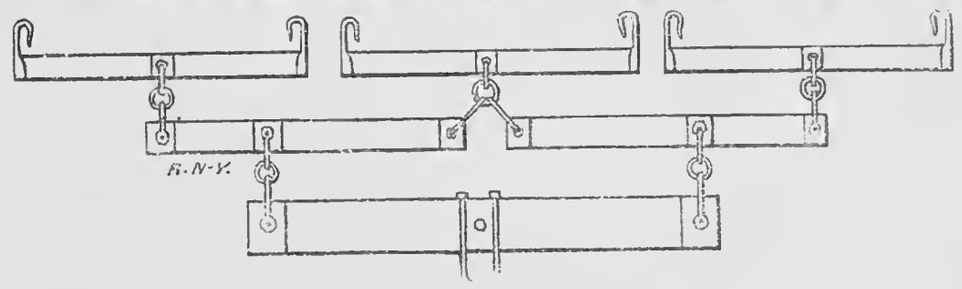


FIG. 477.

FRUITS FOR KANSAS.

J. E. P., Blue Mound, Kan., asks, 1, how to grow chestnuts and English walnuts, and whether the nuts sold in stores will do for seed; 2, what varieties of apples and grapes will thrive best in that section.

ANSWER BY PROF. E. A. POPENOE, KANSAS AGR'L. COLLEGE.

1, To grow these nuts successfully, seeds known to be fresh and in good germinating condition should be procured in Autumn and bedded out through the Winter under a few inches of soil in a well drained situation; or, better, they should be packed in a box in layers alternating with layers of sand, and the box be buried in a place where no water stands. In the following Spring the nuts will probably be found in first-rate condition for early planting. They should be placed where they are to remain if possible. It is not safe to trust seeds purchased in the grocery stores, as it is uncertain whether even a small proportion of those obtained in such places will germinate. 2, The fruit list of the Kansas State Horticultural Society recommends the planting of the following varieties of apples in this State. For Summer: Early Harvest, Red June, Red Astrachan, Early Pennock, American Summer Pearmain. For Autumn: Maiden's Blush, Rambo, Lowell, Fameuse, Fall Wine. For Winter: Winesap, Ben Davis, Jonathan, Rawle's Janet and White Winter Pearmain, among others. For grapes the list names, first, the Concord, Ives, Dracut Amber, Clinton and Delaware, although other and newer varieties are fast coming into favor, which J. E. P. should try. I would also suggest to him and to other Kansans with horticultural tastes, that the annual reports of our State Horticultural Society contain a fund of valuable information upon the topic suggested by the questions asked, and many other points. Such persons will find these reports cheap at the price of annual membership ($1.00) entitling them to a copy.

AN ANTI-KICKING DEVICE.

Subscriber, Cincinnati, Ohio, says he lately saw in the advertising columns of an agricultural paper a picture of a man safely and cheerfully milking what was called a kicking cow to whose leg was tied a machine for keeping the beast quiet and harmless during the operation, and he asks what we think of the efficacy of the device.

ANS.—This so-called machine is merely a contrivance which is strapped to the cow's leg in the expectation that she will quietly submit to such an exceptional proceeding. We have tried it. Instead of making the cow quiet, she kicked still more furiously until the contrivance flew off with a velocity that would have been dangerous to any person in its way. After several trials, we lent it to neighbors, but it was always returned very quickly as a failure. If the cow would only stand quietly with it on, it would be excellent; but a kicking cow is always a nervous or cross beast, and such a one resents, or becomes frightened or furious, when this thing is strapped to her leg, and it does not prevent her from kicking in the least. At least this is our experience; others may have been more fortunate, as the man who is milking in the picture referred to, for instance.

THE BLACK BLISTER BEETLE.

J. A. S., Van Wert, Ohio sends specimens of a bug that has lately appeared thereabouts and which is eating up all the leaves of the pinks, carnations, asters, zinnias, etc., and asks its name and how to get rid of it without injuring the plants.

ANSWER BY G. H. FRENCH.

The specimens of beetles sent and reported as injuring the flowering plants, are Epicanta Pennsylvanica or the Black or Pennsylvania Blister Beetle. They are related to the striped potato beetle, and, like that species, they eat not only potatoes but a great many other plants. There are several species of these blister beetles that may often be found feeding together, and they are usually found in such numbers that whatever they attack is soon destroyed unless means are taken to prevent it. Often they may be driven from the place when they are found eating, but probably the best plan in the present instance would be to brush them with the hand or a stick from the plants into a vessel containing some liquid that will kill them. After a little vigorous catching among a drove of them, those that escape will generally fly away not to return.

THE OIL IN OIL MEAL.

W. H. B., Ann Arbor, Mich., asks whether the feeding value of oil meal given lately in some analyses in the RURAL refers to the meal before or after the oil has been extracted and how much difference is there in its feeding value after the oil has been pressed out.

ANS.—The values of oil meal given, refer to the meal of the oil-cake left after the larger part of the oil has been pressed out; that which remains cannot be removed by pressure and is about one-fourth of the oil originally contained in the meal. If the whole seed were used it would be too rich a food and the oil would be wasted and in fact injurious. The difference in values consists only in the oil which is extracted from the whole seed, but this has never been taken into account when considering the value of oil meal.

Miscellaneous.

H. A. B., Glasgow, Mo., asks what are the distinguishing characteristics of the Jersey and Alderney cows.

ANS.—The names Jersey and Alderney are now commonly used in this country to designate the same breed—the Jersey. Very few cattle are raised on the little island of Alderney and hardly any are imported by us from there, while a great many are brought every year from the larger island of Jersey. The term Alderney, therefore, is a misnomer used by some through sheer ignorance, by some through an assumption of greater knowledge than is possessed by their neighbors, and by some because it was employed to designate all the Channel Island cattle in the Dark Ages, 15 to 25 years ago.

F. A. F., St. Paul, Minn., asks who manufactures the flax breaking and scutching machine described in the article on Flax Culture and Handling published in the RURAL last November.

ANS.—It is made by the American Vegetable Fiber Co., J. F. Dunton, Manager, 213 South Front St., Philadelphia, Pa.

E. F. B., Cobden Ill., ask from whom can he obtain the Jersey Queen and Bidwell Strawberries.

ANS.—The Jersey Queen from Peter Henderson, 35 Cortland St., N. Y. The Bidwell is offered by all small fruit growers.

NOTE.—To "F." let us say that a full article on asparagus culture from the veteran horticulturist, Peter B. Mead, will appear in a short time. As to Dandelions we think not.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 1, 1881.

DIED.

PRESIDENT GARFIELD died on September 19. The poor, brave, patient sufferer has gone at last to rest. We have no words to express our regret, our sorrow. Would that the prayers of this Nation, of the World, indeed, might have been granted. It is hard to say: "Oh, God, Thy will be done."

ALL interested in such matters should read our report of the late session of the American Pomological Society. It has been carefully prepared by one of the most distinguished members.

THE FUND FOR MRS. GARFIELD.—Up to the present writing $306,800 have been subscribed to this fund. While the President lived there was some doubt in the minds of many as to the propriety of establishing such a fund, but now those doubts are removed, and the most practical way of showing respect for our honored dead is in doing a kindness to his bereaved family, and in such a spirit should our contributions be made. In a few days the woman who, by her noble nature and heroic bearing, has won the affections of a nation, will retire to the seclusion of the old home in Mentor—a widow, deprived now of that strong arm of support. No more fitting tribute to the memory of her dead and ours could be paid than this substantial means of support which will place her and her family beyond want as long as she shall live, and it is with the highest gratification that we are to-day enabled to announce that more than the proposed fund of $250,000 has been raised, and still the people pour in their gifts. If Americans are noted for their money-getting proclivities, events have more than once shown that they can be magnanimous when the occasion demands.

BUSINESS ACTIVITY.

WHILE complaints of short crops come more or less loudly from all parts of the country, the volume of general business seems to be unusually great this year. Here extraordinary activity is noted in all leading lines of goods, and the same is the case in Philadelphia and Boston. In all, the distributions of clothing, dry goods, boots and shoes, and, indeed, of all forms of merchandise, is unusually large. In all wholesale lines Chicago reports very great activity, and trade is extremely brisk in St. Louis. From Detroit comes word that the country demand for goods is unprecedented. Louisville declares that trade is far ahead of expectations; and St. Paul and Minneapolis assert that bad weather alone retards exceptionally active dealings in all kinds of merchandise. In Augusta, Ga., Fall business is reported a trifle backward, but wholesale merchants have laid in heavy stocks in anticipation of a large trade. New Orleans is doing a heavy business and expects to do a still heavier one when the river rises. Wholesale houses and retail firms report large sales and brisk business to our mercantile agencies, not only in the large towns, but also in small towns, villages and even cross-road stores. Either the farmers of the country, as a whole, are doing very well despite short crops, or their credit is remarkably good. All manufacturing industries are "booming," and industrious men need not look far for bread or work.

COTTON AS KING.

Cotton is not likely to lose its present position as King of American Commerce just yet. Among the leading items of export we find that cotton, in value, ranks almost as high as wheat, corn and flour together. The valuation of cotton exports for the fiscal year 1881 was, in round numbers $260,000,000, while that of wheat was $168.000.000, corn $51.000.000 and flour $45.000.000. The crop of this year is estimated at about 6,000,000 bales of 400 pounds each which is the second largest crop on record, and tends to show that cotton will be perhaps, for many years yet, our most valuable export.

Although the crop is now a large one, those who are competent to say have expressed the opinion that one-tenth part of the State of Texas *can* produce more cotton than is now raised in the whole country. Indeed, Mr. Hilgard, who has charge of the cotton statistics for the census report, has said that the "Yazoo bottom" in Mississippi can, with proper cultivation and reasonable protection from the river's overflow, be made to produce as much as is now grown by the whole South, and this comprises only an ellipitical area extending from Vicksburg north to the Tennessee line, and is about 50 miles wide in the central portion. Now since the "Yazoo bottom" grows about one-fourth the crop of Mississippi and that State grows about one-fifth or thereabouts of the total cotton crop, the amount now raised can be increased 20-fold by giving the Yazoo district the necessary attention. Then, with equal care for all the cotton raising districts, to what extent could the production of cotton not be increased, and its commercial value enhanced!

IMPURE MILK IN CITIES.

LATELY the Board of Health of this city has been unusually active in preventing the importation of skimmed or adulterated milk. Within the last four days 9,000 gallons have been turned into the Hudson River at the ferries from New Jersey alone; and equally energetic measures are to be taken against importations from Long Island, Connecticut and Westchester and the neighboring counties in this State. Of course, there can be no objection to the introduction of skimmed milk on the score of its healthfulness, the great objection to it is the strong temptation it presents to dishonest dealers to sell it as full milk. Swill milk, however, is far more dangerous, especially to infants, than even what is ordinarily termed "adulterated" milk, and against swill milk we do not notice that any efficient precautions have been taken. Indeed, the only large city which seems to have obtained relief from the swill milk evil is St. Louis, where the Humane Society vigorously prosecutes the owners of stables containing swill-fed cows, for cruelty to animals. Deprived of all opportunity for exercise, shut up in dark, foul, ill-ventilated stables, and fed almost exclusively on distillery swill, such poor beasts soon become diseased and so weak that they could not stand were it not that they are generally kept in stalls so narrow that they are supported by the sides. These pestiferous stables at the East are the hot-beds of pluero-pneumonia and the other kindred diseases that threaten the cattle of the country and are therefore as dangerous to our herds as to our children. They should therefore at once be either radically reformed or abated as so many nuisances.

HIGH PRICES AND GREAT DEMAND FOR MUTTON SHEEP.

SHEEP of the Down breeds are bringing extraordinarily high prices now in England, whether of the South Down, Hampshire, Oxfordshire or Shropshire. A ram of the latter sort from Mr. Mansell's flock, illustrated in this issue, recently brought the astounding price of 200 guineas—$1,016;—and several others realized from 60 to 100 guineas—($305 to $508.) Other sales of the other Down breeds have commanded nearly the above prices for their choicest, and scarcely anything of a good breeding quality seems to fetch less than 10 guineas—($50.) Now here is great encouragement to those who have been importing these kinds of sheep so freely into the United States during the past few months, and also for all who are breeding them here. They are sure of obtaining high prices for their produce for years to come, and a quick sale for all they can multiply. Great Britain is very bare of sheep at present, having lost so many by disease during the past three years. They are said to be nearly four millions less than six years ago. The people there are large consumers of mutton, and all we can send to them of the right quality, they will gladly take from us. Sheep being so much smaller animals than cattle, they are more easily transported comfortably by land or sea, and are greatly less liable to loss by death or disease. England imported about $120,000,000 worth of wool the past year. Thus after we have been able to supply our own manufacturers, we have a British market open for this, as well as for very large and continually increasing quantities of mutton.

SOUTHERN FARMERS.

A NEW way to pay old debts is being tried by the farmers in some parts of South Carolina, especially by those in the northern counties. For instance, at a meeting in Anderson County, the other day, it was resolved that, whereas corn was estimated at only 31 per cent. and cotton at only 25 per cent. of an average crop; and, whereas, this fraction of a cotton crop was the only means in the hands of the planters "for paying their debts and supporting their families;" therefore their first duty was to preserve unsullied their honesty, their integrity and their self-respect. After which preamble, their creditors—the merchants and dealers in fertilizers—were called upon to consent to a *pro rata* settlement of the debts incurred in making the present short crops. In all this there is nothing noticeably novel, except, perhaps, that the farmers should, like traders, co-operate in calling a meeting of creditors. But, in connection with the preamble, there is a good deal that is novel in the final resolution adopted, to "regard as a public enemy any man who attempts to enforce by the law the collection of debts from any farmer who complies with the agreement" to pay all he can of his indebtedness *pro rata*. The movement is spreading rapidly nearly all over the State and is specially directed against dealers in commercial fertilizers. The condition of a great many Southern farmers this year is certainly hard. The partial failure of their two staple products, corn and cotton, increases their need of food supplies from the North while decreasing their means for purchasing them at the same time that the shortage in Northern crops raises the price of everything they have to buy for consumption. The distress that is more than probable in a great part of the Cotton Belt will add another to the many previous lessons as to the advantages of devoting to the production of several crops for food a large share of the capital and labor now almost exclusively employed in the production of a single crop for clothing. Food is more than raiment.

A NEW MODE OF BAITING CATTLE IN TRANSIT.

PROPER transportation of live stock on railroads is still an unsolved problem, despite the introduction of "Palace Cattle Cars" by way of experiment on one line, the multitude of patents, every one of which professes to be able to accomplish the desired object, and the urgent need of some means of carriage at once humane and economical. By the existing system the Western producer suffers a serious loss by the falling-off in weight of animals in transit; the Eastern consumer incurs a grave risk from the unwholesome condition of the flesh likely to be engendered by the hardships of travel, and our exports of living and slaughtered cattle are greatly endangered, depending, as they do, on the delivery of sound living or dead meat abroad. The great objection to all present devices for baiting stock on the cars lies in the fact that all necessitate more or less expensive changes in the rolling stock, whereas success in the traffic turns upon extremely close management, which puts expensive adaptations out of the question. Seven years ago Congress passed an act requiring cattle in transit to be fed and watered at least once in 24 hours; but the law has remained nearly a dead letter owing to the practical difficulties of either unloading the cattle or baiting them on the cars. The Humane Live Stock Express Company of this city proposes to overcome the latter difficulty by erecting feeding stations from which stock in cars can be fed out of buckets supplied by a pipe inserted in the cars by removing a single board at the proper hight. It is claimed that this method requires no change in the cars; involves no delay, and that both food and water can be economically and expeditiously supplied at the same time. Apart from hygienic and humane considerations, any economical system which delivers stock at the end of their journey as heavy as they were at its commencement, is a boon to stock owners and the public at large, and is certain of ultimate adoption. The proposed plan of the H. L. E. Co. seems likely to effect this object.

BREVITIES.

WE learn from Westchester Co., N. Y., that water is selling for one dollar per barrel, and that one man paid $20 for 18 barrels.

THE Supreme Court of Wisconsin has lately decided, in the case of Hoffman vs. Junk, that a conveyance of "real" property, made to escape paying a judgment in an existing suit, is fraudulent and can be set aside.

THAT the purchaser of real estate is entitled to a perfect title and cannot be compelled to take a deed therefor and pay the consideration if there is a mortgage on the land, has recently been decided by the Supreme Court of California, in Hoeckel vs. Reese.

IN his little treatise on Wheat Culture, published by the Judd Company, page 49, Mr. D. S. Curtiss gives a picture of Defiance Spring Wheat. Opposite, on the same page, is another engraving, printed a little *heavier*, of Russian Spring Wheat. Both engravings are precisely the same.

THE National Dairy Fair which was held in this city twice, but which was held nowhere last year mainly on account of the bickerings of its two chief promoters, Messrs. Thurber and Moulton, will be held this year at Cedar Rapids, Iowa, in November and already arrangements are being made to make it a brilliant success.

IN the case of Hart vs. the Pennsylvania Railroad Company a bill of lading of live stock was made in which the value of the stock was stated, the bill being signed both by the carrier and the consignor. The animals were lost through the fault of the R. R. Company and an action was brought by Hart to recover damages which he put at a higher figure than the amount in the bill of lading. In the United States Circuit Court of St. Louis, Mo., Judge McCrary lately decided against the plaintiff, on the ground that the price fixed bound the consignor and limited the liability of the carrier for the value of the stock, to the stipulated amount.

TWO of our large industries are troubled by the high price of corn. The glucose factories all over the country are either diminishing or, more commonly, altogether suspending operations. With corn at 25 to 30c., per bushel they could make a very satisfactory profit by converting it into "sugar," but with corn at 60c. to 70c., per bushel, they could probably make a profit by reversing the transmutation, were such a feat possible. The Kentucky distillers are also worried by the advance in price of this cereal, and are said to be debating whether, in view of the low price of whisky and high price of corn, it would not be advisable to make no more whisky at present. Few are the unmixed evils in the world.

THE MICHIGAN RELIEF FUND. The grand total of the contributions to the above fund in this city to-day, September 26, amounts to $72,892,52 in money, besides a considerable quantity of clothing. Other large cities have also been liberal in their donations, yet the aggregate of all the contributions will go only a small way to relieve the widespread distress. The absence of small donations is very noticeable; yet modest contributions from the multitude who can afford to give little sums, would aggregate more than the total of the checks of the few charitable millionaires. Even if each of our subscribers were to present a bushel of wheat, what a magnificent aid would be afforded!—while if each of our adult readers were to do the same, the result would be far more helpful than the total contributions from this city. No need of sending the grain itself, thus multiplying freight and other expenses. Sell the Michigan bushel and forward the price to the Michigan Relief Association, Detroit, Michigan. Remember that in doing so you are helping unfortunate brother farmers.

THE total cotton crop handled during the year ending September 1 last was 6,589,329 bales, according to the statement of the Financial Chronicle, long recognized as one of the most careful and trustworthy authorities with regard to cotton. This crop was an increase of 14½ per cent. over the previous crop, and by all odds the largest ever raised. Of this total Northern manufacturers took 1,686,809 bales—an increase of 50,000 bales over the amount taken by them during the year ending September 1, 1880, and an increase of 400,000 bales in five years. Southern manufacturers took 205,000 bales—eight and one-fifth times less than the quantity taken by the North, but an increase of 60,000 bales in six years. But as the Northern increase amounted to 400,000 bales in four years and the Southern to only 60,000 bales in six years, it will be a long time until the latter catches up with the former at this rate. The total domestic consumption of the crop, therefore, was, in round numbers, 1,891,000 bales, leaving 4,597,000 for exportation. Both the home and foreign consumption of cotton is increasing, and we believe that the world has now entered on another progressive era in cotton-spinning.

"CORNERS" in financial securities and in produce are doubtless as old, in a mild way, as dealings in both; but it is only of comparatively late years that they have attained such vast proportions as to have attracted nation-wide or even world-wide attention. Hitherto vast "corners" in agricultural produce have, been the special productions of this country; for the governments of "effete Europe" have, most of them, a habit of interfering with the free progress of such speculative operations. A "corner" in cotton at present in Liverpool, England, however, appears to dwarf by contrast all "corners" of the kind that had ever been formed here. Some forty of the chief operators in the staple control all or nearly all, the American cotton in the market, and have raised the price so high that the cotton mills cannot buy it without a strong probability of heavy losses so soon as the price goes down on the termination of the "deal." Having worked up all the American cotton on hand, the millers have, as a final resource, resolved to suspend work on American cotton for a week in the hope that the manipulators of the corner will not be able to hold control of the market for that time. Unless the corner shall have then collapsed, operations will probably be suspended for a second week, after an interval of a week for the filling of urgent orders. Scarcity of any particular product is always suggestive of a "corner" in it, to hazard-loving, moneyed speculators.

Societies, &c.

THE SESSION OF THE AMERICAN POMOLOGICAL SOCIETY AT BOSTON.

[Special report to the RURAL NEW-YORKER.]

THE eighteenth session of the American Pomological Society opened in the Hawthorne Rooms on Park Street, Boston, Mass., on Wednesday, September 14, at 10 o'clock A. M., with its venerable President, Marshall P. Wilder, in the chair, and a large attendance of members and delegates, representing a very large portion of the States and Territories, together with the British Provinces.

The exhibition is held at Boston upon the invitation of the Massachusetts Horticultural Society, and the two societies hold a joint exhibition of fruits in the upper hall of the Horticultural Society, while the vegetables and a portion of the fruits occupy the lower and larger hall, constituting an exceedingly fine exhibit. Flowers and plants occupy Music Hall, filling the entire ground floor together with the broad platform in front of the immense organ, which, with its grand music, constitutes one of the prominent features of the occasion. A large display of cut flowers, apparently crowded out of the space below, occupies the front of the gallery. The whole constitutes an array of gorgeous coloring and beautiful foliage, supplying ample material for a study of days and even weeks, and including many grand and magnificently-grown plants, such as only the houses of wealthy, tasteful and painstaking amateurs can supply.

Recurring to the exhibit of the American Pomological Society:—

The largest exhibit of pears is made by the President of the Society, Col. Marshall P. Wilder, comprising 164 varieties. The exhibit of Hovey & Co. is nearly as large; while Warren Fenno and Benjamin Smith have each contributed to the exhibition over 60 varieties —all pears.

Of apples, a small but very beautiful collection is contributed by Mr. Charles Gibb, of Quebec, which has attracted much attention from the fact that the fruits were more fully colored than many similar sorts grown considerably farther south.

An extensive and quite attractive collection of fruits comes from Maine. The largest and most attractive general collection, however, comes from Michigan, comprising apples, pears, peaches, plums, grapes, and, in addition, a very interesting collection of wild fruits and nuts indigenous to that State. This exhibit is supplemented by a collection of fruits from the farm of Judge Ramsdell, of Traverse City (latitude 44.40 north), showing that apples, pears, plums and peaches are successful in that latitude, even in a year as unfavorable as the present one. These Michigan collections came in charge of a delegation chosen by the Governor of the State, including T. T. Lyon, President of the State Horticultural Society, as chairman of the delegation, and Judge J. G. Ramsdell, Prof. W. J. Beal, Hon. W. K. Gibson and E. H. Scott, all of whom are more or less prominently associated with the horticulture of the State. Along with this collection was shown a map of the State, about five feet by six or seven, on which were indicated the classes of fruits more generally grown and the localities more especially devoted to each; also the localities in which local pomological or horticultural societies exist, showing that organizations of this character are quite generally distributed throughout the lower or southern portions of the State. Along with the map above described, copies of a pamphlet prepared by C. W. Garfield, Secretary of the State Horticultural Society, giving a concise account of the present condition of fruit culture in the State, were placed upon the tables for free distribution among those visiting the exhibition.

We give the above somewhat extended notice of this exhibit as the only one shown under the sanction of State authority; and for the reason that, in its make-up, it seems to illustrate well and fully the varied capacity of the State for the pursuit of several branches of this specialty. It was awarded the Wilder Silver Medal as the best general collection of fruits by a society—the collection having been made, for the State, by the Horticultural Society.

Only seven Wilder Medals were awarded on this occasion, as follows:—To Marshall P. Wilder, for the largest and best collection of pears: —Silver Medal. To C. M. Hovey, for collection of pears:—Bronze Medal. To Benjamin Smith, for collection of pears:—Bronze Medal. To Montreal Horticultural society, for miscellaneous collection of apples:—Silver Medal. To James H. Ricketts, for the best collection of grapes:—Silver Medal. To Michigan State Horticultural Society, for best miscellaneous collection of fruits, composed of apples, pears, peaches, plums, grapes, wild fruits and nuts:—Silver Medal. To B. S. Fox, San Jose, Cal., for collection of seedling pears:—Silver Medal.

The session of the Society was opened in the forenoon of Wednesday, with the transaction of some preliminary business, and the naming of committees on list of delegates, on fruits exhibited, and on nomination of officers for the ensuing biennial term. Owing to the pre-occupation of Secretary Manning (who is also Secretary of the Mass. Hort., Society), Prof. W. J. Beal, of the Michigan Agricultural College, was appointed Secretary *pro tem*. The address of welcome was delivered by President Francis B. Hayes, of the Mass. Hort. Society, in a short but felicitous speech; and was very happily responded to by President Wilder. On reassembling at three P. M. the first business was the delivery of the biennial address of President Wilder, which gave a very interesting resumé of the progress of American Pomology. He referred to the importance of a wider dissemination of the proceedings of the Society, and announced that the Mass. Hort. Society had donated $500 for such purpose: also that he had the prospect of adding $1,000, or more, for the purpose from Boston friends.

The committee on nomination of officers was then called upon, and reported as follows:

For President, Marshall P. Wilder of Boston. Mass. First Vice-President, Patrick Barry, Rochester, N. Y., with a Vice-President for each State and Territory, including the District of Columbia and the British Provinces. For Secretary, Prof. W. J. Beal, of Michigan; Executive Committee, J. E. Mitchell, Philadelphia; George Thurber, N. Y.: J. F. C. Hyde, Mass.; P. J. Berckmans, Ga.; J. H. Masters, Nebraska. The Committees on Native Fruits; Foreign Fruits; Synomyous and Rejected Fruits; and Revision of Catalogue were designated. Also the general Fruit Committee. The Secretary was directed to notify the incoming officers, both elected and appointed, and to request their acceptance.

T. T. Lyon, of Michigan, offered the following preamble and resolutions, which were read and referred to the Committee on Native Fruits with instructions to report at the present meeting.

"Whereas, the American Pomological Society recognizes the establishment of a correct and appropriate nomenclature as one of the first and most essential steps toward the general dissemination of correct pomological knowledge: and, Whereas our State and local agricultural, horticultural and pomological societies now are, and seem likely ever to be, the chief means through which desirable improvements of this character are to be brought home to the great mass of our people; and, Whereas, there is, at present, little apparent harmony of action, on this subject, on the part of such societies, generally, so far as the naming, displaying, and examinations of fruits, as well as the principles upon which awards should be made are concerned; and, Whereas, such lack of harmonious action may reasonably be, in a great measure, attributed to the want of a well digested and generally recognized set of ideas, principles or rules of universal application:

Therefore, Resolved, that a committee be appointed, charged with the duty of framing a set of such principles or rules, to be put forth and recommended by this Society, for the adoption and use of all, whether individuals or societies, who may have to do with the naming, classifying, arranging, exhibiting or judging of fruits, including also the naming of new or newly introduced varieties.

Resolved, That when such schedule of principles or rules shall have been framed and adopted by this Society, its committees shall be required to govern their action thereby; and that it be the special duty of the Committee on Native Fruits to report any departures from such rules, in the nomenclature of native fruits, that shall come to their knowledge, in order that the Society may be enabled to conform its own practice to the same.

Resolved, That measures be taken to give to the rules so adopted a wide publicity, accompanying the same with the suggestion, to all societies and individuals in charge of exhibitions of fruits, that they be embodied in their premium lists and in the rules governing their exhibitions and awards.

Resolved, That, in pursuance of such purpose, it be made the duty of the President of this society, at the opening of each biennial session, to appoint a Committee on Nomenclature, whose duty it shall be to supervise the nomenclature of the fruits placed upon its tables for exhibition, and to correct the same whenever needful.

Invitations for the holding of the next meeting were extended to the society from Missouri, Michigan and Philadelphia, the last receiving its acceptance. This acceptance is supposed to be due to a hope that President Wilder may be able to be present at the meeting there, even should he find himself unable, owing to age and infirmity, to attend at a more remote point.

The reports of the retiring Treasurer, and of Mr. P. Barry, as Chairman of the Committee on Revision of Catalogue, were also submitted and adopted. * * * *

(To be continued.)

NEW JERSEY STATE FAIR.

[RURAL Special Report.]

WAVERLY, N. J., SEPT. 19-23, 1881.

THE 23rd annual fair of the N. J. State Agricultural Society was held upon the grounds of the Society at Waverly Park, N. J., commencing Sept. 19. The weather was fine, the attendance large and the exhibition, in our judgment, superior to any of former years. We were gratified to see less of the "side show" and games of chance business upon the grounds than there was last year, and if this Society would bar out every outside matter and conduct its fair strictly as an agricultural show, it would soon find farmers more interested, their attendance larger, and exhibitors more numerous.

The cattle department was unusually well represented, Jerseys outnumbering any other breed. Ayrshires, Devons, Short-horns, Herefords, Holsteins, Guernseys, and grades were also on exhibition.

The poultry department was inferior in the birds shown, for they lacked some of the most important points of breeding. One coop of Asiatics, a few Plymouth Rocks and a coop of white Leghorns, were specimens that were particularly noticeable. The arrangements for exhibiting poultry is very bad. The light is poor, and some of the coops with first-premium tags could hardly be seen on account of their being so low. The display was not abundant in fine birds.

The pomological display was good, considering the extremely drouthy season, but the arrangements were such that it could not be seen to advantage, and those who were most interested in this department, were obliged to forego a close examination.

The agricultural implements show was one of the largest we ever saw on the grounds.

THE DIRECT-DRAFT EUREKA MOWER, manufactured by the Eureka Mower Co., Towanda, Pa., was conspicious among others. This mower attracted the attention of many farmers, and its many points of excellence were especially noticed. The wheels are large and set directly back of the ends of the cutter-bar, thus bringing the cutter-bar directly in front of the whole machine. It can be set to cut any required hight. It is attached to a floating frame and readily adapts itself to the unevenness of the ground, and can be raised with perfect ease by the driver, and folded and fastened for transportation on the road without the driver leaving his seat. It does not require a very close observer to see at once that this machine has an absolute direct draft, and that if direct-draft machines have merits, this one certainly possesses them. Another great advantage in using this is that it does away with the use of a tedder, as none of the grass is trodden upon by the horses or run over by the drive wheels, and it works equally well upon hill-sides as on flat lands, cutting backward and forward, lengthwise along the slope without driving the team up hill.

THE WARRIOR MOWER CO., of Little Falls, N. Y., exhibited the Warrior Mower, the Bramer Reaper, Randall Harrow, and the Bramer two-horse disc cultivator, implements of their own manufacture. Its lightness in draft, superior cutting qualities, simplicity of construction and ease of operation have gained for the Warrior Mower many first premiums at field trials, and the sales have far exceeded the capacity of the manufactory. The Bramer Reaper which was put upon the market during the past year, has met with universal approval wherever used, and bids fair to take a first rank among the leading reapers of the country. The merits of the Randall Harrow are too well known to need an extended notice from us, and the manufacturers are confident that purchasers, like users, will be perfectly satisfied with its workings. The Bramer two-horse disc cultivator has been strongly approved by all who have used it, and the sales during the past year have been so great that the demand could not be met. As a single illustration of this point, we are informed that in Burlington Co., N. J., alone, 116 of these cultivators were sold during the past year.

The Kemp & Burpee Man'f'g. Co., Syracuse, N. Y., exhibited through their Mr. Kemp, the patentee, several of their manure spreaders. One of these machines was shown in operation, spreading with great uniformity manure (fully nine-tenths of which was clean straw), lime, ashes, and in fact any kind or class of fertilizers necessary for plant food. Its merits being self-evident to a farmer of ordinary intelligence, it is no wonder the company has been unable to supply the demand. A carload of these machines was shipped to this fair, and every one was sold on the grounds.

G. B. E.

P. S.—We have just received a telegram from the Fair grounds at Waverly, N. J., stating that the William Anson Wood Mower and Reaper, exhibited by F. Porter Thayer, manager, 79-81 Reade street, New York City, had each received a first premium.

The Apiarian.

CARE OF COMB HONEY.

G. M. DOOLITTLE.

MUCH has been written in regard to the best methods of securing large yields of honey, the hives best adapted to secure such a yield, etc, while but little has been said in regard to caring for such honey after it has been obtained. It is said that Mr. Durand, the strawberry propagator of New Jersey, obtains more money from his few rows of strawberries carefully tended, and put upon the market in fine condition, than is obtained from as many acres grown and sent to market by shiftless parties. We find the same thing occurring in regard to much produce which is sent to market and honey is no exception to the rule. To place our honey upon the market in the best possible shape therefore should be the aim of every bee-keeper in the land.

If honey is left on the hives but a few days after being sealed over, its snowy whiteness will be changed to a yellowish white, by the bees running over it, thus spoiling it for a really fancy article. Hence he that wishes to get the first price for his honey will remove it from the hives as soon as sealed, and not leave it on, till the end of the season, to save the trouble of going over the apiary more than once, as the custom of some is. I go over my yard once a week, removing all sealed boxes, and placing empty ones in their places, and consider this none too often. After taking the honey from the hives there are two more things to be looked after, or we may have but a second-rate article, no matter how white and nice it may be when first taken off. If stored in a damp and cool room, honey will take on dampness; and if left there long enough, it will become unsalable. How often we see honey becoming transparent and standing in drops on the surface of the combs, ready to leak on being handled the least bit, which not only hurts the looks of it very much but makes it liable to sour unless consumed very soon. While in New York in 1877 I saw in a damp cellar several hundredweights that had became so damp as to burst the cells and run over the crates, floor, etc. It smelt very bad, and was unsightly to behold.

To avoid a mishap like this honey should be stored in a very warm, dry room as soon as taken from the hives and left there for a month or more before it is crated preparatory to sending it to market. For this purpose I use a room seven by ten feet in the southwest corner of my shop, having the outside painted a dark color so that the sun will make the room as warm as possible. The mercury in this room will stand from 90 to 100° most of the time, thus ripening the honey so that in a month's time it can be handled and turned over as much as I please, and not a drop will leak out, even from the uncapped cells at the edges of the box.

If kept thus warm, as nearly all practical apiarists of the present time claim it should be kept, the second trouble is quite likely soon to appear, which comes in the shape of the larvæ of the wax moth. Worms in the boxes an inch long and nearly as large as a pipe stem are not very tempting to a customer who is in search of a nice box of honey for his family, or perchance for a select party. These have been seen by the writer while looking over honey at different markets. To prevent such a state of affairs, the honey, when taken from the hive, should be placed on scantlings which should be raised a foot or more from the floor to permit the placing of burning sulphur underneath the pile, if the moth worm should be troublesome. Examine the honey every few days, and if you see many boxes with little white places resembling flour on the combs, you may know that the little worms have commenced to work and will eventually eat the sealing off, unless either they are killed by burning sulphur or their work is arrested by cold-weather. To sulphur, get a pan of coals and set them in a kettle or fix them in some way to prevent danger from fire, and when they are burning pour on them three-quarters of a pound of sulphur for every 200 cubic feet contained in the room. Sulphur the last thing before crating, and you may be sure your honey will not depreciate while staying in the market. Just how the eggs of the moth gets in the boxes is not known. Some suppose the bees carry them there on their feet from walking over places where the miller has deposited them, while others think the miller get access to the interior of the hive at certain times.

When thoroughly ripened and sulphured as above, the honey should be stored in crates made of nice white wood, holding about 25 pounds each, with the gross weight and the weight of the crate plainly marked on each as well as the net weight. When honey is thus put up it will always bring the highest price in the market. If there is any difference in the honey it should be graded. I make three grades, putting none but that which is nice and white in No 1. For No. 2 that which is mixed with buckwheat honey is used as well as that built on old combs from which it is always darker than that from new. Buckwheat, golden rod and other Fall honey goes as No. 3, as well as all combs which have once been occupied with brood. When all box honey in the United States is placed upon the market in the above-described condition, we shall have made a long stride toward a settled market value for our product, as there now is for most other productions.

Borodino, N. Y.

Miscellaneous.

STATEMENTS SUBSTANTIATED.

Advantages of Southwestern Minnesota and Northwestern Iowa for Stock Raising and Dairy Products.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

WE are always endeavoring to exhibit commendable diligence in gleaning information for the RURAL NEW-YORKER, by reading, observing, investigating, studying, interviewing, and in a general way probing for facts in all departments of agriculture for the edification and instruction of its readers; and in this way incidentally we came across a star-emblazoned folder from the pen of Mr. J. H. Drake, Land Commissioner of the St. Paul and Sioux City Railroad Co., with the pretentious caption—"Something Better than Government Bonds at Four Per Cent." Being somewhat familiar with the magnetic and persuasive style of the writer, curiosity induced us to glance it over and see what kind of sermon he could produce from so unique a text, and what we read subsequently prompted us to visit a number of points and apply the inquisitorial pump to numerous individuals; believing the picture overdrawn, and intending to ventilate what we thought the sophistry of Mr. Drake. Finding, however, that the statements made were fully substantiated, and in some respects were really deficient in detail, and having, in our researches, garnered some valuable information, we will give the salient points of the folder, and the results of our investigations.

"Something Better than Government Bonds at Four Per Cent." asserts that in this country and Europe there is a vast amount of idle capital seeking investment: it challenges the attention of the owners of this unemployed wealth, who are seeking safe and remunerative use for it; and, for brevity, it styles this class "A." It then reviews the inexhaustible amount of brain and muscle in strong, active and energetic, noble-spirited fellows who lack an opportunity in the battle of life and the necessary means to gratify their ambition or develop their enterprise, and these it denominates class "B." It next refers to the counties of Jackson, Cottonwood, Watonwan, Martin, Nobles and Rock in Southwestern Minnesota "as beautiful in surface and fertile in soil as may be found," and says that they are not on the frontier with the hardships and deprivations to the settler incident to pioneering, but are traversed by competing railroads eager for business, with numerous thriving cities and towns; that this country abounds in beautiful lakes, pure streams and rivers, and illimitable meadows of nutritious Blue-joint Grass. The pamphlet says "there are 500 square miles awaiting the alliance of "A" and "B" in the great enterprise," the details of which it leaves them to arrange from the figures and results given, taken from the books and cash accounts in the experience of an English gentleman who has thoroughly demonstrated them. Before quoting the figures "A" and "B" are reminded that no part of God's universe is an unfailing Utopia or earthly Elysium; and both classes are warned of the possibilities of calamity by the elements, snow blockades, grasshoppers and droughts, but the fear of all these is lessened by reference to the fact that figures are based upon the experience of the grasshopper years, 1875 to 1878 inclusive, and that any injury from the recurrence of the unprecedented snow blockade of last Winter could be avoided by timely preparation, while the destruction of the hay crop in Southwestern Minnesota and Northwestern Iowa by drought is unknown. The work then refers to the salubrious climate for both man and beast.

Based upon the experience of Messrs Close Bros., & Co., the English Colonists and extensive farmers of this section, it assumes that "A," having purchased three sections of land, gives "B" sufficient means to build a house and barns and to buy 50 heifers, one bull, 50 sows, 25 young pigs, 500 ewes and 15 rams; then with a moderate knowledge of farming, fair business ability and good common sense, "B" hires three foreman, one for each department, all being practical farmers, and the outcome is that A realizes from the total investment of something like $20,000, fully 22 per cent. interest per annum, from which to pay "B" and reimburse himself: in addition to which the elaborate and exact statement of Mr. Close makes large allowances for disease and other contingencies.

The most surprising item among the accounts of the Messrs. Close, is that of $117.20 for cutting and stacking 200 tons of hay, being about 60 cents per ton. Then comes an imaginary catechism. "But why does this section offer inducements for such investments superior to those of many other portions of the far West?" To which the answer is made, "In its freedom from disease, the cheapness of lumber here, its natural protection for stock, nearness to markets and cheapness of railway transportation, together with its schools, churches, and society where the daily papers of St. Paul and Sioux City are delivered before sunset on the day of their publication, to say nothing of the larger and more rapid rise of landed values"—"But cattle must be fed through Winter?" "Yes," responds Mr. Drake "and the protection from storms assists in fattening and wards off disease, while the small cost of feed is far more than counter-balanced in the surety of the results."

FROM PERUSAL TO PROOF.

A pleasant ride over a portion of the Chicago, St. Paul, Minneapolis and Omaha Railroad, brought us through several thriving towns into the territory under consideration, the topography of which is undulating prairie, interspersed with groves and farms, and dotted with beautiful lakes abounding in fish. The climate is invigorating and healthful; the soil deep, rich and fertile; the farmers, as a rule, thrifty and happy, and the towns seemingly enjoying substantial prosperity. One of these, Heron Lake, a stopping-place with us, is in the midst of the fishing and sporting region of Southwestern Minnesota, and the Chapman Hotel here is a favorite resort for sportsmen, who are hunting the ducks and prairie chickens which abound in the locality.

This is certainly one of the finest grass regions in the Northwest, the grazing being of the best quality, and unlimited in extent. Hay is cut and stacked at a cost of 60 cents to one dollar per ton; and corn can be raised at a cost of 15 cents per bushel, while in the Eastern States it costs from double in corn to ten or 20 times in hay. Moreover, the lands on which cattle are grazed cost only from five to seven dollars and-a-half per acre, compared with Eastern lands at from $50 to $100 per acre.

Calves can be raised to three-year-old steers at a cost of from $17.50 to $23 per head; in fact wintering for cattle is contracted at $4.50 to $5 per head, including feed and care. We asked one party extensively engaged in stock-raising if he was not too far from market to render it profitable. He replied, "No, there is now no point in Southern Minnesota, or in extreme Northwestern Iowa, that is over 20 miles from a railroad. To send to the Chicago market costs one half a cent per pound, so that our beef which sells there at $6 per cwt., nets us here $5.50." And he added: "I know of one drove of 200 head of cattle sold in Chicago by a neighbor of mine (over the line of Iowa), which averaged 1,455 pounds, at $6.25 per hundred, or an average of $90.93 per head, and these cattle were fed on $1 hay and fifteen-cent corn.

Col. G. H. Campbell, of Boston, who was private secretary to Alexander H. Rice when Governor of Massachusetts, has over 3,000 acres, and is preparing for extended operations in cattle and sheep. A number of active hard-working young Englishmen are also located in this section, and they all attest the truth of the statements in "Something Better Than Government Bonds at Four per Cent. Heron Lake, of which we spoke, is a great hay shipping point: one merchant here, Mr. J. T. Smith, is cutting 6,000 tons of hay this year, and will press and bale it for shipment. We quote further, as good evidence, from the Sioux City Daily Journal:—"Alex. Elliot, of Woodbury County, is a splendid example of the successful stock-raiser. In 1863 he began operations by purchasing four cows, ten sheep, and a plug team of horses. This absorbed his capital, and he was in debt for his quarter-section of land. He never raised wheat, but set himself resolutely to the care of his little lot of stock. Time has elapsed, and he now has a flock of 1,700 sheep, 170 head of cattle and 31 horses, all his own; his land is paid for, and he has 1,300 fleeces still to market. He lives in a house that cost him $1,500, and has a barn of about the same value. He is to-day worth not a cent less than $20,000—every cent of it made directly from his stock. Comment on this is not needed."

We confess to some surprise that neither Messrs. Close Brothers & Co., nor Mr. Drake have presented us with statistics, or elaborated the possibilities of butter and cheese making in this region. The dairy industry is left out of the calculation, while it is evident to us that it is one of the most promising. The creamery butter of the Northwest has acquired a reputation, not only in Chicago, New York, Philadelphia and Boston markets, but also in Liverpool, London, Glasgow, and Edinburgh, which commands for it the highest quotations and promptest sales; and assuredly no section affords better advantages for creameries than this. The feed, water, atmosphere, climate and cows are all here; and if the requisite skill is wanting, it should be secured at once. In fact we heard of several creameries in process of establishment, but there should be from one to five in each county, one being at farthest within 15 miles of every farmer. In accordance with the conditions of the country these should be conducted on the Fairlamb, or cream-gathering system, the details of which we have repeatedly given in our correspondence. In our travels we have found many farmers who are receiving from $25 to $30 per cow per annum, for their cream, delivered at their own doors, besides the calves raised upon the milk and grass, and the sour milk fed to their pigs. There are many instances where cows return their purchase money in a single year. Taking this into consideration, with the price of lands sold by the Saint Paul and Sioux City Railroad Company; or leased to desirable tenants by Messrs. Close Brothers & Co.; or Alex. Peddie, on exceedingly favorable terms; and the farmers of Europe or our own Eastern States in drawing comparisons with their present surroundings, cannot fail to be convinced of the superior advantages afforded here for grass and corn culture, stock-raising and dairy products.

We met another gentleman in this section, strictly reliable and thorough-going, whose address we could give if necessary, who told us that he bought 30 head of yearlings and 30 head of two-year-olds, and without doing any work himself, simply as an experiment, hired their herding in Summer and their feeding and attendance in Winter, kept them until they were three-and-a-half years old, and realized a net profit of 33 per cent. per annum on his investment. We doff our *chapeaux* therefore to Mr. Drake, and are prepared to admit that we are convinced that here is something better than Government bonds at four per cent.

Southwestern Minnesota and extreme Northwestern Iowa surely are for beauty, richness of soil, accessibility, pure water, and healthful climate, exceptionally inviting, and the entire section would to-day be a shining example of Western prosperity had its early settlers adopted the theory so abundantly elucidated in this little document; and here is now a golden opportunity for the "A's" and "B's" to invest jointly their money, brains and brawn for a successful life-work which will pay an average of over twenty per cent. per annum.

Messrs. Close Bros. & Co. of Lemars and Sibley, Iowa, are backed by a vast amount of English capital and are preparing still more extensively for tenant farming, erecting houses and barns upon moderate-sized farms and offering advantages to tenant farmers who have not capital with which to start successfully. They controlled the breaking of 27,000 acres in this region the present year, and had the Spring been early and favorable they would have increased the area to 40,000 acres. They now have about 45,000 acres of tenant farms, with some 350 tenants, and we learned that so equitable is their dealing that a tenant seldom leaves them until he has accumulated sufficient to enable him to purchase land and commence farming for himself. They built 270 tenant houses, and with each a stable, granary and cribs, this season, and by one year from now will have approximately 500 tenant houses, farms and farmers.

The Scottish American Land Company (limited) with $500,000. capital, represented by Mr. Alex. Peddie, of Emmetsburg, Iowa, own some 40,000 acres within the limits of our investigation, which they, too, are placing under tenants upon plans and terms similar to those of Messrs. Close Bros. & Co. Both also aid the tenant where desired in procuring stock and getting a nice herd of cattle and hogs, or a good flock of sheep started for future growth and development. Tenant farmers who contemplate immigrating to the Northwest might advantageously correspond with these gentlemen. As the "A's" and "B's" cannot gainsay the statements made by Mr. Drake, and revealed by us herewith, we see for the future of this district a grand success in the combination of capital and labor.

The wheat crop here the present year has been almost a failure, but the flax crop is immense, while rye and barley have yielded well, and corn (unlike that in Illinois and the Middle States), promises to be the most bountiful yield ever known in the history of Southwestern Minnesota. At the advanced prices for farm product, Southern Minnesota will this year, despite the partial failure of her wheat crop, have more money distributed among her farmers than ever before known in her history.

CATALOGUES, ETC.

THOMAS MEEHAN, Germantown, near Philadelphia, Pa. Catalogue of the Germantown Nurseries. All kinds of deciduous and evergreen trees and shrubs, vines and climbers; fruits, hedge plants, hardy herbaceous and greenhouse plants, etc. Also seeds of trees, shrubs and fruits. This catalogue will be furnished free to those of our subscribers who apply. Mr. Meehan is well known as one of our most experienced horticulturists.

Literary.

BE CAREFUL WHAT YOU SAY.

Is speaking of a persons faults,
Pray don't forget your own;
Remember those in houses glass
Should never throw a stone.
If we have nothing else to do,
But talk of those who sin,
'Tis better we commence at home,
And from that point begin.

We have no right to judge a man,
Until he's fairly tried;
Should we not like his company,
We know the world is wide.
Some may have faults—and who has not?
The old as well as young;
We may perhaps, for ought we know,
Have fifty to their one.

I'll tell you of a better plan,
And find it works full well:
To try my own defects to cure
Before of others tell;
And though I sometimes hope to be
No worse than some I know,
My own shortcomings bid me let
The faults of others go.

Then let us all, when we commence
To slander friend or foe,
Think of the harm one word may do
To those we little know;
Remember, curses sometimes, like
Our chickens, "roost at home;"
Don't speak of other's faults until
We have none of our own.

THORNS AND ROSES.

CHAPTER III.

(Continued from page 659.)

I would have been content to pass the remainder of the evening in talking of Brandon and Kingston, but the day was not ended yet.

We were sitting by the window, admiring the glorious sunset, when a shadow crossed the window; and hearing a ring, I glanced at Edith, but she apparently was too lazy to speak.

The door opened, to admit a strange gentleman—strange, that is, to me only—for aunt greeted him cordially: Edith vouchsafing a distant bow.

"Mr. Nevil Verner," said aunt Dorothy, "my niece—Kate. Will you ring for lights. Edith!"

"Please don't bring lights for me," said Mr. Verner, in a clear, high voice, "this light, it seems to me, could not be improved."

He was standing by the window, speaking to aunt, when I glanced at him, rather curious as to the personal appearance of the man whom Edith hated. Though not so tall as Brandon, he was upright and broad-shouldered; his eyes calm, his face rather pale, its features small and regular; without approaching to dandyism, he had the air of being perfectly dressed, and he was handsome to effeminacy; but as Edith afterwards said, "that was his misfortune, not his fault." In manner he was courteously kind, and, on the whole, I liked him.

We sat down in the twilight, aunt at the table, with its old china and a vase of damask roses in the centre; Mr. Verner faced me, whilst Edith had buried herself in an arm-chair in the shadows. From my point of view it was a pretty scene—the glimmer of silver and Sèvres; faces indistinctly seen in the dying light: a glow of crimson on the opposite wall; the dusky garden and glorious sky; whilst through all stole the sweet scent of roses.

"Your 'twilight tea' has become an institution," said Mr. Verner, addressing aunt; "my mother envies me when I describe this room. I trust Miss Lovel"—turning to me—"that you will honor us by a visit to Newville? Not that I can offer any attraction, but I ask it on behalf of my mother, who is quite isolated through sickness."

I replied that I intended to call with aunt Dorothy, and we fell into a conversation on riding and driving and walking, aunt chiming in with approvals; and but for Edith we should have been in perfect harmony. When Mr. Verner addressed her, she replied provokingly, and struck in on our conversation with cool sarcasms and irony too subtle for my simple aunt to perceive.

CHAPTER IV.

I felt rather annoyed with Edith; she might dislike Nevil Verner, but it was unkind to show her dislike in this way; and I thought him very agreeable, pleasing, and kind.

"I am glad you came this evening," said aunt.

"It is always a pleasure to see Miss Lovel," he replied.

And then a monosyllable fell from Edith.

"Which?"

"I beg your pardon?" said Mr. Verner.

"There are three 'Miss Lovels' present, which one did you mean?"

"Suppose I say Miss Edith Lovel?"

"Miss Edith Lovel would believe you—oh, quite!"

He spoke about sports and some shooting he

had had on the moors last season, and Edith began:

"Do you read Wendell Holmes, Mr. Verner?

"'Poor gentle guest, by nature kindly cherished,
A little world grows dark with thee in blinding death;
One little gasp—thy universe hath perished—'

"I forget the rest, but do you ever think of the 'poor gentle' bird when you sally forth to waste powder—as you say?"

Fearing hostilities, I interposed with a casual remark; but before long, Mr. Verner took leave of us, and I then remonstrated with my cousin.

"Don't bother!" she said, crossly. "It was as much as I could do to keep from throwing my teacup at him!"

"You misjudge him, Edith. I don't think him so very faulty."

"Nor did I at first, but I know him well now. He wanted to see what you were like; seeing, he approves, and your pride piques him. Beware for constancy is unknown to Nevil Verner!"

"You think me in great danger?" I said, calmly.

"I like you, cousin," she said, quickly, looking at me. "Nevil is attracted by you, and you will be everything until——or possibly he is the paragon that others say, and I only ridicule him because my own ambitious views have faded away."

I recalled all that had passed to-day, from my visit to Kingston to Nevil Verner's visit here. Edith had made me picture Brandon almost a misanthrope, and she had misled me about Nevil, for I liked him, and looked forward with pleasure to the intended visit to his home.

When the day appointed for it arrived, Edith decided to accompany us—I riding, she with Aunt Dorothy in the phæton.

On the way we passed Kingston, and I half hoped Brandon would appear; but save a deer bounding through the park, there were no signs of life. The drive, though long, was very pleasant, aunt said.

We were received by our host with graceful cordiality, though I thought he seemed surprised, and not altogether pleased, on beholding Edith.

"You didn't expect me," she said, coolly; "but I must have something to do, or I should die."

Aunt gave her a warning look, which had not the slightest effect on the wilful young lady, save further rousing the spirit of mischief. We—or rather—I was introduced to Mrs. Verner, a pale, thin lady, whose beauty had wasted away in sickness, and whose face was marked with lines of pain; but she gave us no long discourses on her suffering, not even hinting at her infirmity; and though compelled to remain indoors day and night, her world reduced to two rooms, she was the kindest and most gentle of women; and her sweet influence sobered even Edith. That Nevil was a beloved son it was easy to see; the worn face brightened when he spoke, and the dim eye kindled with loving admiration.

When, at length, we thought it time to go, she thanked us for the visit, and turning to me with a smile, asked me to ride over without ceremony often, and I gladly promised. I was left the last with her, and Mr. Verner looked back smilingly. We descended the stairs; and then he addressed me with a laughing apology for having monopolized the conversation.

"Like me, Kate didn't think of you," said Edith. "May we see your improvements?"

We all went out to the garden, and aunt, taking Edith's arm, administered a mild rebuke, so that Mr. Verner and I were left together, strolling along the smooth paths.

"You are fond of flowers, Miss Lovel? Ah! that is a peculiarity of my own. This fountain is one of the improvements, and I selected this spot because it is just under my mother's window, and she can see it, for we call this part her garden.

We entered the hothouse, which contained some rare exotics, that called forth my admiration.

"I am rather proud of my collection," said Mr. Verner, presenting me with a scarlet spray, which I fastened in my habit.

Returning home I mentally decided that I had enjoyed the visit, and liked Mrs. Verner; when we entered the house Edith touched my arm.

"You look very nice, Kate, and some one besides myself admired you to-day——Oh! Brandon, where did you spring from?"

For Mr. Lovel appeared with extended hand.

"I have been waiting here a little while."

"To see me, I hope?" said Edith, to which he replied, that that surely went without saying.

After changing my habit I ran down stairs to find Brandon and aunt deep in chess, whilst unlike the other night, Edith joined amiably in the conversation, leaning on aunt's chair, until languor suddenly overtook her. I asked her to play; after a long mental struggle she complied; and, her somewhat erratic performance ended, called on Brandon to sing.

Oh! those happy, quiet evenings! to me always associated with pearly twilight skies and rosy sunsets, with snatches of quaint old ballads, with blossoms drooping and fading as day died!

More than a month had elapsed since I returned home; the time had passed in a routine which Edith called dull, but which to me was pleasant. In my daily rides I became acquainted with the villagers, and by all was kindly received; in fact, my appearance was the signal for a jubilee amongst the little folks, with whom my black horse was a favorite. There were some queer characters among our tenants, and I was altogether in a new world. Thanks to my father and aunt Dorothy, there was little poverty; but she had pensioners among the old people, and these I often visited, and read for them, so that I was soon well known, and I may say, without vanity, well liked. Among Brandon's tenants I ventured several times; they were much more numerous than ours, and some were poor, but on every side I heard stories of his goodness, and remarks that he was so much kinder than old Mr. Lovel.—[To be continued.

All monthly prostration and suffering by ladies is avoided by using Hop Bitters a few days in advance.—*Adv.*

For Women.

CONDUCTED BY MISS RAY CLARK.

THE SPELLIN' SCHOOL.

See that crevice in the floor—
Slender line from door to door,
First meridian of the school—
Which all the scholars toe by rule.
Ranged along in rigid row,
Inky, golden, brown and tow,
Are heads of spellers high and low,
Like notes in music sweet as June,
Dotting off a dancing tune.

Boy of Bashan takes the lead—
Roughly thatched his bullet-head.
At the foot an eight-year-old
Stands with head of trembling gold;
Watch her when the word is missed!
Her eyes are like an amethyst,
Her fingers dove-tailed, lips apart;
She knows that very word by heart
And swings like any pendulum,
Trembling lest it fail to come.

Runs the word along the line,
Like the running of a vine,
Blossoms out from lip to lip,
Till the girl in azure slip
Catches breath and spells the word,
Flits up the class like any bird;
Cheeks in bloom with honest blood,
And proudly stands where Bashan stood!

—B. N. Taylor, in Home Life in Song.

MRS. GARFIELD.

Our country and, in fact, the whole world is pouring out its sympathy to Mrs. Garfield, and it is but fitting that we make special allusion to our indorsement of such sentiment.

The vocabulary would seem to have been exhausted in giving expressions to feelings of sorrow from the heart's deepest recesses, but some suggestive words are ever at hand; hackneyed they may be, but none the less genuine. As to the martyred one, now that his victory is won, we should say: "Well done, thou good and faithful servant," and recognize his gain in our loss, and leaving him in the hands of the God he loved, pass to the living.

Sympathy has, as it were, been gathered from the ends of the earth into an immense cauldron and there condensed by fever heat into the purest compassion.

This the offering we give to the woman who is now deserving of more than tongue can utter, and who, in coming days, will need the greatest consideration. Her sons and daughter are not forgotten, but their lives partake so much of the future that the hand of time will in a measure alleviate their sorrow. A work is before them, to uphold the loving parent who must look to them for the inner comfort that only a family can impart.

FASHIONS.

The fashion for stripes is lengthwise.

Bustles have a modernized name—crinolets.

Shoulder capes and fichus are still to be much worn.

The dolman in varied shape will take the lead in Fall wraps.

Flowers are used with evening toilets to a great extent.

The fashion in sleeves will meet the requirements of a multitude of tastes. They may be long, demi-long or three-quarter lengths; tight, shirred or puffed.

The most fashionable way of dressing the hair is low and close to the head; but women with large faces and necks should avoid this style and wear it high or off the neck.

Plush is still in vogue and very much used. The trimming plushes are of different lengths of pile; they are shaded, plaided, striped—Bayadere and Roman—and mottled in color.

Ostrich feathers in every form will be in as much demand this season as they were last.

The combination fever still rages. There is a satisfaction in this for the many of limited means, as two partly worn suits may be combined and reproduced in a pleasing costume; or a few yards of new material will freshen an old style dress. Entire new fabrics are made up in this way.

Wraps of chenille net are in favor, and as the season advances these will be lined with silk and possibly a heavier intermediate lining.

English straws and heavy rough-and-ready black and white straws prevail for Fall. Shapes are large and eccentric.

Cloth dresses are to be the thing for street wear. Early in the season they will be trimmed with velvet or plush, and later on with bands of fur, with muff and hat to match the fur trimming. Dark green, dark blue and browns of all shades from wood color to seal will figure in these suits, together with the pretty cheviot patterns which have had such a run of late.

Shepherd's plaid dresses of soft all-wool fabrics, in black and white, blue and gold, ruby and cream color, or gray and brown, will be one of the materials for ordinary street costumes this Fall. A few of the dresses made of these goods are combined with velvet, but they are usually made of kiltings or frills of the same, and adorned with handsome buttons of blue or gray steel, or silver.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

CONCERNING CLOSET PESTS.

Ants, Silver Fish, Roaches, Etc.

MARY WAGER-FISHER.

To begin, stop up all cracks and cranies with plaster-of- Paris or thick paint. After this is dry, wash the closet shelves with salt and water, *never using soap*. At the most, use as little water in cleaning closets as possible, as roaches in particular are fond of dampness. Silver fish feed largely upon paper, and the foremost thing to keep out of closets which they infest is that article. Glass jars that have been cracked or whole ones are capital vessels in which to put tea, coffee, tapioca, rice, sago, spices, sugar, raisins, etc., which are not otherwise provided for in the way of tin caddies. Allow nothing to remain in paper in the closets.

Red ants I have never been troubled with, but I have had legions of black ones, that have been attracted by sugar or sweetmeats. A bit of cake or sweets of any sort are sure to draw them, as well as are fruit jars that have been put in closets without being wiped clean. In order to catch ants, saturate a sponge with large pores, with sweetened water. When the sponge is filled with ants, immerse it in water. I greatly dislike to kill ants, as they are the most intelligent creatures in the universe, and I find that the best way to keep rid of them is to make the closets so far as possible insect-proof, and then to keep them free from enticing tidbits. I was visiting in a house lately—a most cleanly kept dwelling—where silver fish were making very annoying depredations. Both the ceiling and the walls of the drawing-room were papered, and in the corners of the room, and along the border, in every spot where the paper was not firmly attached to the plaster, the silver fish were eating it. The mistress of the house was at her wits end to know what to do, and there seemed nothing better to do than to strip off the paper and have the walls painted, a most tiresome task, but one that should have been done at the outset. But the house, which was of stone and over-grown with English ivy, was 80 years old, and paper had been used on the walls for years and years. I was particularly glad to see that all the old-time architecture of the room had not been torn out. There was the high, narrow mantel-piece with beautifully grooved and checked ornamentation—rather high and narrow for convenience to be sure; but a wide one could have been placed beneath it, if desired. On the dinner table were old china dessert plates and saucers, beautifully decorated, that had been nearly half a century in use, and were still free from flaw or fleck. Apropos of old walls—I would never paper them, as I most assuredly would never hang paper on new ones. Instead, I would have them thoroughly cleaned, and all the cracks and broken places mended with suitable plaster; then paint thoroughly. There is nothing so clean and renovating as fresh paint. Many of the neutral shades are pretty for walls, while for halls that are large, bright red paint is charming for the walls. Have the ceiling white, and for a cornice or border put up a molding of gilt or of wood that has simply been oiled, especially if the interior woodwork of the house has been oiled instead of painted—as it should have been.

As to old homesteads, with their small panes of glass, low ceilings and wooden shutters—leave them untouched. These things are fashionable now in the finest of houses. What are inconvenient and unhealthful should alone be remodeled, and, above all, don't tear out anything that is quaint or genuinely "old-fashioned." You say, "*that* is delicious," and guard it accordingly.

A VEGETABLE TALK.

ANNIE L. JACK.

We got tired of beans and beets, cucumbers and corn, and our thoughts went back regretfully to the days of green peas and asparagus, when the amateur cook brought on the table a (to us) new dish. It was from a recipe in "Practical Cooking," and as follows: "To stew oyster plants:—Scrape and throw (I suppose one *can* be gentle, not to splash; the word *throw* is suggestive) into a bowl of cold water in which is mixed a tablespoonful of vinegar. When all are scraped, cut into half-inch lengths, *throw* them into boiling water in which are half a teaspoonful of salt and one-third of a teaspoonful of sugar to one quart of water. When done, drain and mix them with white sauce drawn butter." We enjoyed the change and uncovered another dish, in which we found parsnips. They had been parboiled then cut lengthwise and fried in hot butter. As some of the children, though very fond of corn, objected to gnawing it from the cob through fear of the toothache, we tried the following recipe from the same book with success: Mix into a pint of grated green corn three tablespoonfuls of milk, one tea-cup of flour, a piece of butter the size of a hickory nut, one teaspoonful of salt, half a teaspoonful of pepper and one egg. Drop it by dessert spoonfuls into a little hot butter and cook on both sides. It resembles, and has the flavor of fried oysters, and is a good tea or lunch dish. Serve hot on a warm platter. Of course, this is some trouble, but this the change amply repays. We have boiled our corn in the husks this season. This it is said is practiced at the Saratoga Lake House, and it certainly tastes sweeter, though requiring more room to boil.

FLOWERS FOR THE DINING TABLE.

Of all the flowers we have ever made into bouquets for the dining table, Plumbago Capensis has pleased us most. The delicate trumpet-shaped flowers of azure blue, mingled with the pedate fronds of the Maiden-hair Fern—Adiantum pedatum—found in all damp, rocky woods, form a combination not excelled. We successfully transplanted several clumps of this fern to a "rockery" years ago, and its fronds have aided us in many a floral decoration.

PICKLED PEACHES.

Pare freestone peaches; place in a stone jar. Make a sirup in the proportion of one quart of best cider vinegar to three pints of white sugar; boil, skim and pour over the fruit boiling hot. Pour off the sirup the next day, heat and again pour over. Do this every day until the fruit is the same color to the center. Any kind of spice may be added to the sirup that is liked. MARY B.

HOME-GROWN TEA.

We received from Florida a sample of tea grown and prepared by Mrs. I. Sumner. That lady writes:—

"Inclosed find a small sample of my first crop of tea. I am disappointed that I could not make it look more like the imported article, but as it is the *flavor* we want, I suppose the looks do not matter much, and I hope to improve by practice. My plants were three years old last Spring. After this year I expect to make all we want for use in our own family. I only used the five upper leaves, which were very tender and succulent."

The tea was tested at the Rural Farm and pronounced of very good quality. We know of several Rural subscribers who are making tea enough for their own use, thus demonstrating that tea culture in some of the Southern States is not the impracticable industry it was once held to be.

ANOTHER SIDE TO THE THRICE-TOLD STORY.

Who would not like to give the woman a stirring up, who, as soon as her husband comes in from his own work, sets him doing hers? And what a pity it is that the patient victim of the woman "born tired" should not, once in a while at least, assert himself and oblige her to make a little use of her own hands and feet. The name of such women is Legion; and, more's the pity, every Gill among them has her Jack. A. E. S.

These old people whose blood has become thin and steps feeble are praising Hop Bitters for the good it has done them.—*Adv.*

News of the Week.

HOME NEWS.

MONDAY, Sept. 26, 1881.

At midnight on the 19th, the long suspense in which a nation had been waiting for many days, was broken by the death of our illustrious President. It was a grand struggle that he waged with death, but the great enemy overcame him at last, in that final onslaught which wrung from those pale lips the last cry "O I how it pains me!" Though Garfield is dead, the sublime influence of his life; the noble qualities of his manhood; his exemplary Christian character; his ideal statesmanship—all will be long cherished by a loving nation.

On Tuesday morning at 10 o'clock the President's remains, after having been viewed by hundreds of people at Elberon, were transferred to the train which was to bear them to Washington. On the foot of the black coffin lay two large and beautiful leaves of the cypress palm, typifying heroism. There was no other floral decoration. The train consisted of four cars: the first for the baggage, the second for the remains, the third for Mrs. Garfield, her children and attendants, the fourth for the members of the Cabinet and other notable personages. No demonstrations were made by the people along the route except at Princeton where the college students strewed the track for several hundred yards with choice flowers. On arriving at Washington the remains were received by a military escort and conveyed to the Capitol where they were lying in state until Friday afternoon. At that time the funeral train left Washington for Cleveland where it arrived Saturday at about 1:30 P. M. The body is to be interred to-day in Lake View Cemetery, near Cleveland, according to the expressed wish of the late President. The funeral services begin at 10 A. M. to-day.

A post-mortem examination of the body disclosed the fact that the ball, after fracturing the right eleventh rib, had passed through the spinal column and lodged about two and a half inches to the left of the spine, near the first lumbar vertebra, and there had become encysted. The immediate cause of death was internal hemorrhage, nearly a pint of blood having escaped into the abdominal cavity. The lungs were affected with bronchitis, but contained no abscesses; the liver was enlarged and fatty, and in the left kidney there was a small abscess. The weight in the body at death was 120 pounds, showing a loss of weight since he was shot of about 100 pounds.

On receiving notice from the Cabinet, Vice-President Arthur took the oath of office in this city, at 2 o'clock on Tuesday morning, September 20, and thus became President of the United States.

President Arthur again took the oath of office at noon on the 22nd in the Capitol at Washington. The oath was administered by Chief-Justice Waite in the presence of the Cabinet officers, Ex-Presidents Grant and Hayes, several senators and representatives and others. The new President delivered a brief inaugural address, in which he said that no extra session of Congress would now be called and that he should endeavor to profit by the example of his illustrious predecessor. A number of the Cabinet handed in their resignations in writing, but the President requested them to retain their positions for the present.

The deep grief in which the nation has been plunged struggles for expression. Everywhere the ominous black and white intertwined and the national colors at half-mast may be seen, and the American people can truly unite with Queen Victoria in her message of condolence to Mrs. Garfield: "Words cannot express the deep sympathy I feel with you at this terrible moment. May God support and comfort you, as He alone can." The grief is not only national but world-wide in its extent!

The late President's mother was not informed of her illustrious son's death until 8 o'clock Tuesday morning, when the sad news was broken to her. She could not realize the truthfulness of the telegram. The morning paper she read with eagerness. "It cannot be that James is dead," she murmured. "I cannot understand it. I have no further wish to live, and I cannot live if it is so." Although her general health is good at present, many fear that her words are prophetic, and Mrs. Larrabee, her daughter, does not think otherwise herself. The dead President's children wept bitterly when they heard the sad news. Two of the Garfield boys were at Williams College, Massachusetts. Harry came on to Long Branch at once, but James A., Jr., was detained by sickness. He attends the funeral at Cleveland, however.

The wretch Guiteau is closely guarded, fears of mob violence being at one time entertained. He seemed greatly affected when he heard of his victim's death, and said: "Well, I am glad the President is out of pain." According to a statute of New Jersey, where Garfield died, the criminal must be tried where the victim dies, but District Attorney Corkhill of Washington says that Guiteau will be indicted, convicted of homicide, and executed in Washington.

Notwithstanding the announcement made by President Arthur in his brief address on taking the oath of office, he, on the 23rd inst., issued a proclamation, convening the Senate on Oct., 10.

The fund for Mrs. Garfield at this writing amounts to $306,800. It is suggested that the subscription lists be kept open until the fund becomes $500,000.

"Improvement Has Been Wonderful."

A gentleman makes the following report of his wife's case: "Mrs. J——'s improvement has been wonderful since she commenced taking the Oxygen Treatment. Her digestion and appetite are good, and her strength very much restored; so much so that she has for the past month been going down a flight of steps to the dining-room to her meals, and she seemed revitalized and brighter and more cheerful than I have seen her for years." Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free*. Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Phila. Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Sept. 26, 1881.

Our weekly summary of agricultural news from all the chief points in the country, condensed from telegrams received in this city at the close of each week, should be both of interest and importance to our readers. The reports are made by people who are quite trustworthy and thoroughly posted in the matters of which they speak. They do not concern merely the points from which they come, but also the entire country commercially tributary to those centers. They nearly all reach this city on Saturday morning and all describe matters at the several points just as they are as late as Friday or still later. Thus our readers can get at one glance a fair idea of the condition of crops and markets all over the country on precisely the same day. There is no better possible way of helping our friends to form a just conclusion as to the advisability of selling or retaining produce, etc., than to show them in this way what is being done all over the country. In this as in other departments of the paper we expect to make still further improvements, so soon as we can learn in what way to do so from the expressed wishes of our friends. This news is thoroughly "live," wholly practical and entirely trustworthy.....Here are some condensed items of agricultural news telgraphed to this city between Friday noon, September 23, and date: Boston, Mass.—Hides still dull with a weak tendency. A good demand for wool and recent advance in price well sustained; sales 3,464,800 lbs.—considerably less than in the two previous weeks.....Providence, R. I.—Cotton market strong; middling uplands 12½c; middling gulfs, 12¾c. Dealers say outlook is good for Fall trade.....Buffalo, N. Y.—Breadstuff's markets active and higher. Grain rates on lakes and canal have not altered within the week, but freights tend upward.....Philadelphia, Pa.—Wool ¼@1c higher than a week ago; sales the largest ever made in the market, aggregating nearly 1,500,000 pounds for the week. Cotton moves slowly. Flour scarce and wanted at higher prices. Grains active and higher under speculative influences; but exports dull. Stocks accumulating; there are now in elevators 725,000 bushels of wheat; 1,068,000, of corn and 189,000 of oats. Dairy produce continues scarce and firm. Fruits active and strong. Provisions in brisk jobbing demand and very firm .....Detroit, Mich.—The speculative drift in grain which early in the week was "bearish," is now "bullish" with grain offerings greedily taken. Receipts of wheat decreasing owing to the acceptance by farmers of the higher prices offered for "futures" over "spot." Were the differences between prices in the different months less, the movement of wheat would be greater. Stored 840,000 bushels against 153,000 at the same time last year.....Louisville, Ky.—Grain strong and advancing. Wheat is moving slowly owing to seeding and farmers' expectations of higher prices. No reliable estimates of growing corn crop—it is so very irregular; Kentucky, however, may produce enough for bread and feed. Last week's rains enabled farmers to plow for wheat and the indications are for an increase of 20 per cent. more than last year. Late rains throughout the State have greatly helped tobacco.....St. Louis, Mo.—Renewed activity in wheat and corn, with advancing prices in both. Stock of grain accumulating; elevators reported full; preparations for further heavy speculations. Cotton steady; 10,735 bales in compress against 7,239 at same time last year; increase due chiefly to early maturing of present crop.....Kansas City, Mo.—Grain market unsettled, with a downward tendency. Cattle active; but 10@15c lower on shipping grades. Hogs steady and firm. Fruits and other produce fairly active; prices good.....Omaha, Neb.—Reports from the Republican Valley show a great falling off on the corn crop; but two-thirds of the State will have a fair yield. Corn is being held at 45c, and higher prices are expected.....San Francisco, Cal.—Last week's estimate of wheat unaltered. Considerable wheat has been cut for hay. Wheat dull with a decline of 2½ per cental from last week. Buyers holding back; $1.65@$1.67½ per cental is paid for No. 1; $1.75 asked for prime shipping. Choice yellow corn $1.55 per cental on a rising market. Barley ru.....Denver, Col.—Produce scarce and high; wheat firm. California potatoes bring good prices; Salt Lake slightly lower. Eggs scarce and high. Poultry in great demand.....Portland, Oregon.—In Oregon and Washington Territory the wheat crop of 1881 is estimated at 305,000 tons (9,838,709 bushels) of which 135,000 tons are in the Willamette Valley, 100,000 tons in East Oregon and Washington Territory. Fall wheat in the Valley not as good as expected. Eastern Washington average ought to be 25 bushels per acre; it is often from 40 to 60 bushels. The census average for Oregon last year was 17 bushels per acre.....Baltimore, Md.—Grain markets strong during the week; but little exported; freights therefore low. Oats and rye in this market unimportant. Cotton steady. Provisions jobbing trade pretty good at fair figures. Intense indignation still over elevator extra charges. These removed from Canton elevator after grain blockade ceased; but suits threatened for recovery of fees paid under protest.....Chicago, Ill.; Light receipts and heavy shipments of wheat and oats have reduced the stock of both: receipts for the week, 236,948 bushels of wheat, 2,590,844 bushels of corn; 370,837 bushels of oats. Shipments 692,081 bushels of wheat; 2,340,199 bushels of corn: and 619,583 bushel of oats. There are in elevators 11,000,000 bushels of grain, of which about 6,000,000 bushels are corn. Many believe there is a "corner" in corn for October delivery, one feature of the scheme being to put off settlement until the supply of corn is beyond the capacity of the elevators. Grain markets active with an upward tendency.....Peoria, Ill.: Receipts of grain fairly regular; market quiet and somewhat unsettled.....Cincinnati, Ohio. Wheat has a fair local demand and prices have advanced 2c. but are closing easier. Corn 1c. higher, selling at 70c. Oats, rye and barley all in good demand at higher figures. Provisions scarce and with a decided upward tendency. Leaf tobacco easy under better prospects for the growing crop.....Milwaukee, Wis: Continuous rainfall has delayed thrashing to such an extent that the mills are at a stand-still unable to get grain enough to continue running. The idea that the President's death would cause a decline in prices caused a quantity of wheat to be thrown on the market early in the week, producing a decline in prices which has been recovered.....Minneapolis, Minn; Continued wet weather throughout the Northwest has damaged wheat in the field fully 25 per cent in lowering the grade and in loss of grain. This will apply at least to 2,000,000 or 3,000,000 bushels, mostly belonging to large farmers. Very little thrashing done; grain deliveries not half enough even to supply the mills. Shipments of flour for the week 28,964 barrels—very firm and advancing.....Richmond, Va.: Late rains in this State and North Carolina have improved tobacco considerably, and the quality, too, of the short crop will not be so bad as at one time expected. Tobacco quiet now. .....Wilmington, N, C.: much complaint of crops. Loss of cotton about one third. Turpentine trees damaged 10 to 20 per cent. by late storms. Corn in demand..... Charleston, S. C., The best grade of cotton brings 11½c. and of turpentine 50c.-the highest points in this market for a year. Receipts of cotton for the week 13,807—about half the receipts for corresponding week last year. New rice coming in freely at 6¾@7½c. per pound for clean Carolina. Five steamers waiting for freight, one of them nearly loaded.....Savannah, Ga.: Cotton on Monday was higher, but since then striking 'longshoreman have embarrassed all business. The military are now under arms and more troubled is expected.....Augusta, Ga.: Weather still favorable for cotton picking. From dry weather most of the bolls are open; considerable cotton has therefore been blown to the ground, and was injured by late rains.....New Orleans, La.: A large business is being done in cotton for "spot" and "future," the latter for December showing an advance of 10 to 20 points. Rice sells rapidly. Corn firm at $1 for white and 85c. for yellow. Provisions firm. Potatoes and onions $3.25@3.50 per barrel. Bulk grain coming in slowly owing to low water in the river.....Little Rock, Ark.: Corn reports very discouraging. Highest estimate of cotton for the State is five-eighths of a crop: grain less than one-half. No bolling; no fruiting; no rainfall.....Memphis, Tenn.: Receipt of cotton unprecented; more than double that of last season, and increase of general business therefore remarkably great.....Nashville, Tenn.: Grain quiet but firm. Provisions stronger. Peanuts held one-half cent higher: stocks very light; large sales during the week at full prices. Wool firmer, with but little coming in.....

LAND has been sold in London at the rate of $5,000,000 an acre, in New York at $8,000,000, a floating paragraph says, and in Paris at $2,810,000 in a sale in August.....Wine growing is being successfully pursued in Virginia, and is rapidly assuming large dimensions. It was first introduced by Germans, but others are now taking a hand in it. One firm, with thirty-seven acres of land, has produced 3,500 gallons of wine in a season. It is reported that the yield of two counties this year will be 50,000 to 60,000 gallons. There is a ready market for all that can be produced..... Two heirs of a Virginia farm quarreled over thirty-seven cents. They went to court, and at the end of six years, when a settlement was made, the heirs received nothing, the farm being sold to pay legal expenses.....The hog products of last year in the United States aggregated 38,000,000 of which number 7,000,000 were handled at the Union Stock-Yards, Chicago..... From careful inquiries made of the guilds and labor societies it is found that the range of wages in Switzerland is $80 a year for gardeners, $50 to $60 for adult male farm laborers, and $14 to $20 for adult females, with lodging and board for all; young men on farms $20, with clothes added to board and lodging.....Complaints come from the corn-field in some sections of North Carolina that great injury is being done by thousands of squirrels that have appeared in them..... Crops in India vary widely in various districts. From Mysore it is reported that, owing to a scarcity of rain, plants are withering, prices are rising, and the outlook on the whole is gloomy. From Coorg intelligence of a similar kind has been received, but from other parts of the country the accounts are fairly satisfying. So far as Bengal and Behar are concerned, the output of Indigo is likely to be unusually short; but in the Northwest the prospects are better. The quality of the tea is said to be excellent, but it is not expected that the quantity available for exportation will reach what it was thought that it would. Compared with the first three months of last year, the imports this year have been slightly increased and the exports have slightly fallen off. Compared with the year 1879, however, the returns thus far are better.....On September 14 the Illinois Condensing Company at Elgin made its offering for milk for the six weeks ending Oct. 30. It was 13 cents per gallon, or $1.56 per 100 pounds. This was refused by all its patrons, who ask 15 cents—what is offered by Chicago milkmen. Mr. H. L. Borden, the manager, announced that the factory would close Nov. 1. This will throw 70 hands out of employment. The factory is an institution, and fixes the price for the district. It uses 3,500 gallons of milk per day....

Lydia E. Pinkham's Vegetable Compound revives the drooping spirits; invigorates and harmonizes the organic functions; gives elasticity and firmness to the step, restores the natural lustre to the eye, and plants on the pale cheek of beauty the fresh roses of life's Spring and early Summer time.

AG'L DEP'T., CORNELL UNIVERSITY, ITHACA, N. Y., Sept. 8, 1881.

MR. DAVID LAWTON—*My Dear Sir*:—I have just finished filling our Silo, using one of your Belle City Feed Cutters (No. A. 1). It did its work to my entire satisfaction, cutting the four acres as fast as two men could feed it without breakage or hindrance, and without even once sharpening the knives. I take great pleasure in recommending so good a machine.

Very respectfully, I. P. ROBERTS.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

Liver Coughs often taken for Consumption are cured almost instantly with Hop Bitters.

BURNETT'S COCOAINE

The Best of All Hair Dressings.

It allays irritation, removes all tendency to dandruff, and invigorates the action of the capillaries in the highest degree, thus promoting a vigorous and healthy growth of hair. Its effects upon the glossiness and richness of the hair is such as cannot be surpassed.

BURNETT'S FLAVORING EXTRACTS are the best.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Sept. 24, 1881.

NEVER in the annals of New York's trade has there been shown such a lifeless interest in the course of business as has been exhibited the past week. Every commercial pursuit has been reduced to the limits of mere absolute wants in the unanimous eagerness of our citizens to express their respect for the departed chief of the nation. Time and profit have been made subservient to sorrow, and the sound of traffic is muffled. Mournful manifestations profusely drape the Exchange, markets and storehouses, but beyond these sympathetic displays there is a still stronger sentiment of solemnity pervading the entire merchant community, which is significant of unfeigned love for our unfortunate late President and sincere grief for the untimely close of what promised to be a marked career in American history. Business is not likely to assume any regular movement until after the funeral of President Garfield, and it may be safely remarked that there seems to be no want of confidence as to the future among owners of goods, capitalists and speculators.

BEANS AND PEAS.—Trade supports the strong and higher figures quoted for new beans. Receipts large but well out of receivers' hands. A few Southern B. E. peas quoted $3.50 ₱ 2 bush. bag. Wisconsin green peas firm at $1.75@1.85, the latter for '81.

Marrow beans, new, $3.25; mediums, $3.20; peas, $3.20@3.25; white kidney, $2.75@3.20; red kidneys, $1 90 @2.30; black or turtle soup, 1.75.

Receipts of beans for the week, 10,536 bush.
Exports do. 583 bbls.

BEESWAX—Dull at 21½@23c., the latter for Southern.

BUTTER.—Fancy creamery is about the only grade that shows a steady sale, and as receipts of nice fresh flavored lots are small full list prices are obtainable. Stock that depends upon a wholesale trade is dull and at the moment in buyers favor, though not enough so to note a positive decline. Western butter holds up well in price as receipts of grades suitable for the market and common table use have noticeably fallen off during the week. This, however, is no test week for any item of produce.

Creamery, finest tubs, 34@35c.; good to prime, 31@33c.; other quality, 24@29c.; sweet cream, 28@30c.; State dairy tin. 24@27c.; do, half tubs, choice, 30c.; do. fair to prime, 26@28c.; Welsh tubs, 25@29c.; poor State, 23@24c.; Western imitation creamery, 20@26c.; do. dairy, choice, 24@26c.; other, 17@22c.; factory or ladle-packed June in Iowa, 18@18½c.; other, 15@17c.; common Western, 14c.

Receipts for the week, 32,534 pkgs.
Exports do. 4,700 do.
Cold storage to G. B., 90s.

CHEESE.—There is little doing; New York prices are supported by interior figures. Some of the supply goes over, but that does not matter much when it is composed of fine August make. Advices from England are adverse to free export sales. The home trade is fairly active, but a good grade of creamery skimmed calls a good deal of the demand. Heavy hard skims dull and lower. Western cheese not plenty.

State factory, fine colored, 13c.; fine white, 13c.; good to prime, 12¾@12¾c.; fair to good, 11¾@12¾c.; poor to fair, 10@11¾c.; Ohio factory, cheddar, fine 11¾@12c.; fair to prime, 10¾@11¾c.; factory, flat, fine mild, 12¾@12¾c.; good to prime, 10¾@11¾c.; fair to good, 10@10¾c.; poor, 8@9¾c.; Creamery, partly skimmed, 7@9c.; fully skimmed, 4@6c.; full-skimmed factory, 2@3c.

Receipts for the week, 85,857 bxs.
Exports do. 37,251 do.
Liverpool cable, 61s.
Steam to Liverpool, 20@22s. 6d.

COTTON.—There has been a good steady business for use. One of the features of the week is the fact that English spinners have begun to run full time again, which makes an outlet for a large consumption. Speculation has been interrupted by the calamity of the week.

Quotations are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

Strict good ordinary	9⅜	Middling	11 5-16

Receipts for week, 15,312 bales.
Exports do. 21,209 do.

DRIED FRUITS.—Apples are quiet but firmly held. A little home call may be quoted at the extreme for evaporated or sun-dried. Peaches quiet but not offered to any extent. Small fruits firm with some help from the known scarcity of other sorts.

Apples, evaporated, new, 10½@ 12½c.; do. old, rings, choice, 12c.; do. fair to prime, 10¾@11¾c.; N. C. new, sliced, extra fancy, 9½@9c.; choice, 7½@8c.; fair to good, 6½@7c.; Southern, new quarters, choice, 6@7c.; fair to prime, 5¾@6c.; inferior, 5@5½c.; State, old, fine-cut, choice, 6½@7c.; quarters, do. 6¼@6¾c.; small lots, 6½c.; Ohio and Mich. choice, 6@6¾c.; Western, fair to good, 5½@6c. Peaches, evaporated, peeled, 1880, 33c.; unpeeled, 22c.; N. C. peeled, new, fancy, 23@24c.; choice, 22@23cc.; Ga. peeled, choice, 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 9@9½c.; halves, Tenn. 9c. Plums, State, black, 17c.; Southern Damson, 14½@15c. Blackberries, 13@13½c. Cherries, Southern, dry, 19@20c. Raspberries, 22c. Huckleberries, 15c.

FLOUR.—Supplies are unusually small and holders have a firm position, especially in the high brands, as there is still a good stocking-up call. Exports light, but at the moment it looks as if some shipping grades will have to be met.

No. 2, $1.60@5.25; State and Western, superfine, $5.05@6.55; city mills, extra, $7@7.75; Spring wheat, extra, $6.40@6.85; Spring XX and XXX, $7@7.75; patents, $7.75@9.50; Ohio round hoop shipping, $6.60@—; trade brands, $7.20@7.75; St. Louis extra, $6.75@7.50; do. double extra, $7.25@7.50; do. family, $7.00@8.00; Southern extra shipping, $6.75@7.65; do. XX and family, $7.50 @8.25. Rye flour, superfine, $5.90@6.25. Corn-meal, Brandywine, $3.90; do. Western, $3.60@3.85.

Receipts of flour for the week, 94,115 bbls.; corn-meal 3,467 do.

Exports of flour for the week, 51,800 bbls.; corn-meal 3,375 do.

FRESH FRUITS.—Exports of apples, 1,808 bbls. Sweet apples dull; other standard varieties steady at full prices, with a demand for more red than are here. Pears have begun to arrive freely again and prices have eased up considerably. A fine class of stock is now coming forward. Peaches have fallen off in quality and must be in fine order to make the extreme. Plums were forced up too high for buyers; quotations have been reduced within a day or so. Grapes sell fairly; basket fruit abundant and quoted at popular prices. Cranberries are in stock, but there are few orders. The West is expected to soon bid for supplies. Peanuts dull at the advance; large buyers decline to operate.

Apples, Western New York, prime mixed lots, ₱ bbl. $2@2.25; fair do. $1.75@2; Sweet, 75c.@$1.25; Gravenstein, $2.50@3; 20-oz. near-by, $2.25@2.50; Maiden Blush, near by, $2.25@2.50; Fall Pippin, near-by, $2@2.25; Baldwin, Jersey, ₱ d.-h. bbl. $1.75@2; Greening, do. $1.75@2. Pears, Bartlett, up-river, ₱ bbl. $5@6; Western New York, prime, ₱ keg, $2.50@3; do. Inferior, $1.50@2; Boston, ₱ bush. box, $1.50@2.50; Louise Bonne, Western New York, ₱ bbl. $2.50@3; Sheldon, do. $2.50@3; Beurre Bosc, $2.50@3; Duchess, $2.50@3; Beurre d'Anjou, $3@4; Seckle, choice, $3.50@4; fair to good, $2@3; Swan's Orange, $2@2.50; cooking, $1.50@2. Peaches, New Jersey and up-river select, fancy, ₱ bskt, $2@2.50; choice lines, $1.50; good, $1@1.25; common, 60@70c.; culls, 40@60c. Plums, Reine Claude, ₱ bbl., $10; ₱ crate, $1.75@2.25; Golden Drop, $2@2.25; Copper, ₱ bbl. $8@8.50; Damson, $5.50@6; do. ₱ ½ bush. crate, $1@1.25; Grapes, Del., State, case of 18 3-lb bxs, $1@1.50; bskts, ₱ lb, 7@8c.; Catawba, State, bskts, ₱ lb, 6½@7c.; Concord, State, case 18 3lb bxs, $2@2.25; do. in bskt, ₱ lb, 3@4c.; Jersey case of 24 2-lb bxs. $1.75; up-river, loose, ₱ lb, 2½@3½c. Cranberries, Cape Cod, choice, ₱ bbl. $8; do. fair to good, $6.50@7.50; do. poor to fair, $6@6.50; do. prime, ₱ crate, $2@2.25; Jersey, do. $1.75@2; do. poor to fair, $1@1.50. Watermelons, Maryland, ₱ 100, $12@15; Jersey, Black Spanish, $12@16; culls, $3@6. Nutmeg Melons, Hackensack, choice, ₱ bbl. $2.50@3.50; Keyport, choice, $1.50@2; culls, 50c.@$1.25. Peanuts, Va., hand-picked, ₱ lb, 7½@7¾c.; fancy, 7c.; extra prime, 6¾c.; good to prime, 6¼@6½c.; shelled, screened, 6@6½c.; shelled, unscreened, 5½@6c; pecan nuts, ₱ lb 8@11c.

GRAIN.—The market generally shows a settled position. Foreign wants for wheat seem to be more urgent, and if trans-atlantic advices continue good a revival of enlarged exportation is expected. Corn has had a fair business considering the high quotations. Oats active. Buckwheat quoted 80@90c. nominally. Canada barley, $1.15@1.20. Rye not so firm as it was.

Wheat, Spring, $1.26@1.42; Spring No. 2, $1.40@1.41; red Winter No. 2, $1.40@1.43½; red Winter, $1.32@1.50; white Western and State, $1.30@1.48. Rye, $1.03@1.08. Oats, white No. 1, 52c.; No. 2, 50½@51c.; No. 3, 49c.; mixed, No. 1, 43c.; No. 2, 43½@43¾c.; No. 3, 41c. Corn, Western mixed, 65@75c.; No. 2, 73@74½c.; yellow, 72@75c.; white, 77@87c.

Receipts for the week, wheat, 1,255,542 bush.; corn, 992,700 do.; oats, 536,200 do.; rye, 1,109 do.; malt, 84,200 do.

Exports for the week, wheat, 972,930 bush.; corn, 403,224 do.; oats, 17,066 do.

The visible supply of grain, comprising the stocks in granary at the principal points of accumulation at lake and Atlantic ports, and on rail, on lakes and on Mississippi River:

	1881, Sept. 17. bush.	1880, Sept. 10. bush.	1879, Sept. 18. bush.
Wheat	20,146,548	19,848,516	15,419,985
Corn	21,488,970	24,083,101	17,303,970
Oats	6,720,368	6,789,859	1,484,594
Barley	522,721	338,732	524,950
Rye	727,384	645,309	627,026

HAY AND STRAW.—Receipts continue light and the market is circumstantially higher. Straw steady and favoring buyers.

Prime Timothy hay, ₱ 100 lbs., $1.10@1.15; medium Timothy, 90c.@$1; shipping grades, 50@80c.; clover 55@70c. Straw, No. 1 ryr, 70@75c.; short rye, 50@55c.; oat and wheat, 40c.

Exports for week, 773 bales.

HOPS.—There is a fair arrival of new hops, but brewers are using old, as a rule yet. Exports represent interior-bought stock. The market has a good, wholesome, firm tone.

Crop of 1881, choice, 22@23c.; fair to prime, 18@21c.; 1880, good to choice, 18@20c.; 1880, fair to prime, 13@17c.; 1880, poor to fair, 10@13c.; 1880, eastern, 10@18c.; 1879 fair to prime, 12@14c.; 1878, 5@8c.

Receipts for week, 1,010 bales.
Exports for the week, 321 do.

HONEY.—New is here but nominal in price.

White clover, 2-lb bxs, choice, ₱ lb, 17@18c.; fair to good, 14@16c.; buckwheat, 12@13c.

LEATHER.—Quotations are:—

HEMLOCK SOLE.

Heavy	20@—
Damaged	17@18

MILK.—The average price for commission milk is lower, as supplies are not wasting so badly by heat as they were; cans of 40 qts. average $1.79.

POULTRY AND GAME.—There is a fair demand for good dressed poultry and prices are now within the reach of several classes of buyers. This will give animation to trade. Turkeys are steady; a good many young and poor arrive. Geese scarce. Shippers had better continue to pack in ice; it is to early for straw packing.

Turkeys, Phila. prime, 17@18c.; State and Western dry-picked, 15@17c.; scalded, 14@16c.; young turkeys, 10@16c. Chickens, Phila. 17@19c.; Bucks Co. 16@18c.; Jersey, 16@17c.; State, 16@17c.; Western, 13@16c. Fowls, Phila. dry-picked, 16@16½c.; Bucks Co. 15½@16c.; Jersey, dry-picked, prime, 15@16c.; do. scalded, 1 @15½c.; State and Western, dry-picked, prime, 15@15½c; scalded, prime, 14@14½c.; inferior, 12@13c. Ducks, Spring, Phila. ₱ lb, 16@18c.; Jersey and Bucks Co. 17@18c.; State, 14@16c.; mixed State, 13@15c.; old, fair to good, 12@14c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75@2.

It has been a low week for prices, as the market has had a daily over-stock of chickens and fowls.

Chickens, New York, ₱ lb. 12½@13c.; State and Penn. 12@12½c.; Western, 11½@12c.; Southern, 11@11½c.; Fowls, Jersey, State and Penn. 13c.; Western, 12½@13c.; Southern, 12@12½c. Roosters, old, 5@6c. Turkeys, Jersey and Penn. 14@15c.; Western, 13@14c. Ducks, Jersey, extra-large, ₱ pair, 87c.@$1; Jersey, New York and Penn. 60@75c.; Western, 45@55c.; Southern, 45@50c. Geese, Jersey, N. Y. and Penn. $1.20@1.75; Western mixed and Southern, 75c@$1.12. Pigeons, full-grown, 25@30c.; young, 20@25c.

The demand is good for good game birds, but much of it turns bad or poor in appearance, which amounts to the same, and prices have a wide range. Venison lower with large receipts.

Grouse, prime, 80@90c.; soft, 50@75c.; partridges, prime, $1.25@1.50; soft, 75c@$1; woodcock, 80c.@$1.25; English snipe and plover, fresh-killed, $1.75; venison, Minn. short saddles, 18@20c.; Western, 15@18c.

PROVISIONS.—A strong corn market has supported hog products in price, but the export trade is not of seasonable magnitude. Market closes firm.

Pork, extra prime, ₱ bbl. $15@15.50; Western mess, new, $19.50@20. Lard, steam Western, ₱ 100 lbs., $11.35@12.10; prime city, $12.30. Hams, smoked city, ₱ lb. 14@14½c.; pickled Western and city, 12@12½c.; Shoulders, smoked city, 8¾@9c.; pickled, 8½c. Rib bellies, pickled, 10½@11¾c. Bacon, long clear and Western, 10½@11c. Beef, Western mess, ₱ bbl. $12@13; prime, $13@14; India mess, ₱ tce. $21.50@23.50. Beef hams, ₱ bbl., $22@23.

Receipts for the week—Beef bbls. and tcs. 630; pork, bbls 1,275; cut-meats, pkgs 24,930; lard, do. 12 200.

Exports for the week—Beef, bbls. and tcs. 2,660; pork bbls. 1,429; cut meats, lbs. 4,142,131; lard do. 5,031,988.

RICE.—Fair activity prevails in the domestic sorts, and prices are firm. Receipts of the new crop have been less than anticipated, and are sold in every instance prior to arrival.

Carolina and Louisiana, common to fair, 5½@6c., good to prime, 6¾@7¼c.; choice, 7¾@8c.

SALT.—Quotations are: Ashton's at $2.50; Higgins's at $2.40; Holmes's extra sifted, $3.40; Deakin's at $1.25; Evans's at $1.20; Washington's at $1.25; Marshall's at $1.25; Virden's at $1.20; Worthington's at $1.20; Mediterranean at 25c.

SEEDS.—Clover quiet and offered in buyers' favor Timothy in fair demand for use.

Clover, Western, 1880, job lots from store, 10½@11c.; do. in car lots on track, 9¾@10c.; 1879, do. 9@9½c. Timothy, job lots in store, $2.90@3.25. Flax-seed, American rough, $1.41½@1.50.

Receipts for the week, 3,800 bush.
Exports do. 1,427 bush.

SUGAR.—Quotations are for:

Cut loaf, 10¾c.; crushed, 10¾c.; powdered, 10¼@10¾c.; granulated, 10¼c.; mould A, 10c.; confectioners' A, 9¾c.; standard A, 9¾; off A, 9¼@9½c.; white extra C, 9@9¼c.; yellow extra C, 8½@8¾c.; C, 7¾@8)gc.; yellows, 7@7¼c.

TOBACCO.—There are no new features.

VEGETABLES.—Exports of potatoes for week, 4,100 bbls. A good many low-grade potatoes arrive, but are neglected, and prime lots of Rose and Peerless are firm. Nova Scotia begins to come, selling at $2@2.50, the former for mixed lots. Garden truck is in light supply and firm; though onions are plenty and easier. Potatoes: Early Rose and Burbank, L. I., ₱ bbl., $2.50@2.75; State and up-river, $2.25@2.50; Snowflake, $2.25@2.50; Burbank, $2@2.37; Peerless, Jersey, $2@2.12; sweet potatoes, Va. yellow, $3.25@3.50; Del. River, $3.25. Sweet corn, Jersey, prime ₱ 100, 75c.@$1; wax beans, L. I., ₱ bag, $1.25@1.50; string beans, $1.25@1.50; Lima beans, potato, $3@3.25; flat, $2.50; cucumbers, L. I., ₱ 100, $1.25@1.50; pickles, ₱ 1,000, $2.50@3; egg plant, ₱ bbl., $1.75@2; tomatoes, ₱ bush., 70@80c.; squash, Marrow, ₱ bbl., $1.50; cabbage, red and other, ₱ 100, $7@10; beets, L. I., ₱ bbl., $1.50@2; white onions, $2.25@2.50; yellow, $2; red, $2.25; Chester' $2; carrots, $1.50@2; turnips, Russia, $1.75; pumpkins, ₱ 100, $5@8.

WOOL.—The market is temporarily quiet; sellers are assured of a good demand by Oct. Last prices still holding, viz.:—

Ohio, Penn. and West Va, XXX and picklock, 43@45c.; X to XX, 41@42c.; No. 2 to No. 1, 38@45c.; coarse, 33@36c.; combing, 42@48c. State and Western X to XX 38@40c.; No. 2 to No. 1, 36@44c.; coarse, 32@34c.; combing, 38@45c.; combing unwashed, 28@34c. Virginia, West Va. and Md. unwashed, medium, 27@29c. LIVE STOCK MARKETS.

NEW YORK, Saturday, Sept. 24, 1881.

BEEVES.—Receipts for the week, 14,218 head; do. last week, 14,180 head. Trade was uncommonly dull and depressed at both market places. The demand for dressed beef is expected to be light to-morrow, and with Monday a national holiday, slaughterers were not disposed to buy ahead. In fact, buyers who not unfrequently purchase a half dozen or more car loads of cattle in every market were content with one or two loads to-day. A few lots of Texans and Coloradoes were sold at 7¾c. to 9c., to dress 55 lbs., and the reported sales of natives ranged from 8 to 11¾c., to dress 55@57c.

MILCH COWS—Active at $30@60 per head, cows fit for private sale will make $55@70.

VEAL CALVES.—With small supplies the market is firm and strong. Extra right sizes have sold above best rates. Up river dressed, 12½@13½c.

Live calves, prime N. J., 9c.; do. State, 8¾@9c.; poor to good, 7@8¼c.; Mount Hollys, 7¾@9c.; buttermilks, 4½@6c.; grassers, 3½@4c.

SHEEP AND LAMBS.—Receipts for the week, 37,844 head; do. last week, 37,191 do. There is every prospect of a light run on Monday, and butchers were induced to take the offerings at barely steady prices. Some Virginia store ewes sold at 3½c., but ordinary to prime sheep ranged from 4 to 5¾c., with lambs selling at 5½@6¾c.

SWINE.—Receipts for the week, 28,267 head; do. last week, 22,564 do. Common to prime corn-fed, $6.75@7.10 ₱ 100. Grass hogs have no quotable price. New Jersey pork, 8¾@9¼c.; city dressed, 8¾@9c.

Terms for 1881.

The subscription price of the Rural New-Yorker is

Single Copy, per year	$2.00

CLARK & CO., SOMANAUK, ILL.

For the Young.

WHAT SHALL IT BE?

RAY CLARK.

SOME time since Uncle Mark succeeded in obtaining my consent to write something for his numerous relatives.

I had not the remotest idea of how to fulfill my promise creditably, but feeling a *little* compassion for him in view of his great charge —his army of cousins—I felt that my mite should not be withheld.

I have said a *little* compassion, for I happen to know Uncle Mark's wife and am anxious to keep in her good graces; besides he once accused me of indulging in a curtain lecture; for this I have scarcely forgiven him, as my reprimand was merited.

"Then came the tug of war." What shall it be? This thought at last photographed itself upon paper and relieved me of further necessity for waste of brain material in selecting a subject.

This title is suggestive, and may be applied just now to writer and reader. What shall I write? What can you do?

Children—most of Uncle Mark's nieces and nephews I guess are registered in this class of the Census Report—I wonder if you often or ever think what you can do to make your life of use. Do you ever say, "O, I'm too small, what can I do?" If you have ever allowed yourself to think you can do nothing drive such notions away and decide to try to make yourself felt in the world; your world you know is just where you may happen to be. You need not travel, commence where you are. You may eventually need or wish to change your field of labor. Do not wait, however, but commence at once.

Now understand me, don't say, "She's some staid old maid who wants to make Jack a dull boy by giving him all work and no play," You'll not be generous if you do. As to the old maid I've nothing to say, but do not accuse me of wishing to make you old before you have been young—no, take all the enjoyment you can in life, at the same time remember that if God spares you a life work is before you. Boys and girls will be men and women, and what is needed in the land is good and useful inhabitants.

In Cincinnati two boys by their energy raised $15 for the Garfield fund, the amount, though small, was as much in proportion as many of the hundreds of dollars that have been given. Two Summers ago three little girls visited the "Five Points House of Industry" in this city, New York. First of all they attended the service in the chapel, then visited the dining room and saw how the little boys and girls partook of meals, then they were shown the sleeping and play rooms, etc. It was a pleasing sight and gave them much happiness to feel that the needy children had been provided for.

On reaching home the visit was discussed, and as they talked the idea dawned upon them that they might also give a little aid to this charity, so other companions were advised of their intention, and soon six or more little girls were seen working with a will, making articles for a fair, the proceeds to be given to the home before mentioned. Older heads conjectured failure but were agreeably disappointed. The "Busy Bees" so named, worked on, and at last held their fair and realized over $40. How proud they felt when the day came for presenting the gift! and how much better had their time been spent than if all had been passed in play. Happiness made the labor light.

What these little folks did you can all do. Let the spirit be the same although the work may be different.

I have given the girls more space in my examples of usefulness; I hope the boys will not be offended; if they are they will have to "grin and bear it," as they always have plenty of opportunities to prevail. It is to be hoped that all the cousins possess magnanimity.

Let your mind and body receive equal consideration, do not despise manual labor, but let it be governed by the intellect.

The waste basket has come into my mind—suppose Uncle Mark should say, "Too long, I meant a short article," what a disappointment it would be after so great an exertion, so I will finish by asking you to think, what shall it be?

New Members of the Club for Week Ending Sept. 24.

LETTERS FROM THE COUSINS.

DEAR UNCLE MARK AND COUSINS:—It is such a beautiful morning I thought I could spend it best in writing to you, i. e., if you will excuse all the mistakes I make, which I am afraid will be a good many, as this is my first attempt at writing for the RURAL. My home used to be in the country, but my father moved into the city of Erie last Spring. I am now visiting at my grandpa's in the country, and am having just a splendid time playing croquet, picking berries, hunting eggs and feeding chickens. I went to the woods yesterday and gathered ever so many wintergreens and had such a nice time rambling about. Grandpa has been buying a pony for Aunt Emma, and she has named it Draxy. Isn't it a funny name? I have the promise of a ride as soon as it is trained for riding. I must tell you before I close how many brothers and sisters I have. I have one brother three years old, and three sisters, one fourteen, one eight and one six. I am ten years old. I must now say good-bye, hoping Uncle Mark will not think this too poorly written to print.

Your cousin, ALICE J. LEWIS.
West Mill Creek, Pa.

DEAR UNCLE MARK:—Papa wrote to The RURAL NEW-YORKER, to ask how I could become a member of the Horticultural club, and I find the question answered in a late issue, so I have hastened to send you my name and address that I may be enrolled as a member. I am fifteen years old. I love flowers, but until lately have not been able to cultivate them, having lived in London, England till about a year ago. London is such a large city and so full of houses that there is no room for gardens, except public gardens, but now I am in America and papa has a garden and a small greenhouse, he has given me a little patch of ground for my own use to cultivate as I please. I am, also learning the botanical names of the plants in the garden. Of course I do not know much about horticulture at present but I hope by reading the RURAL to learn more.

Your niece, NELLIE F. COLLIS.

[We are very glad to welcome Nellie to our Club, especially since she is so desirous to learn all about flowers. Anything that we can do to assist her, will be done most willingly. She has carried out my wishes, I see, in regard to the little garden plot mentioned in a late RURAL. U. M.]

DEAR UNCLE MARK:—I am a little girl ten years old and have never been to school. My mamma has taught me at home. My papa takes the RURAL, which we all like very much. I love to read the letters from the cousins, and have wanted to join the Club for a long time, but have waited until I could write myself. This is my first letter; I hope it will be accepted. The seeds you sent came up well and were doing nicely when the dry weather set in. The pinks looked nicely when an old rooster and two of his wives went in and scratched them nearly all up. What they left, all except two, have died. They are blooming and are very pretty. I have one little brother (Johnnie). We are going to have a garden next year and we would like to have you put our names on your list.

KATIE AND JOHNNIE MOBLEY.
Elkton, Todd Co., Ky.

UNCLE MARK:—We see by a late RURAL that any farmer's boys or girls can join the Horticultural Club, so my sister and I would like to become members of it. We enjoy reading the cousins' letters. We just came from the East to the northern wilds of Wisconsin. We live near two beautiful lakes full of nice fish. There are a great many deer running in the woods, and some bears in the swamps, eating up the blueberries. We found this Spring thousands of wild flowers, a good many we never saw before; we find beautiful flowers and Princess Pine. We are growing the cranberry vine and pitcher plant as pot plants From our yard we can see hundreds of fragrant white water lilies, and we row around in our boat so as to enjoy them.

Your nieces, KATE AND FANNIE METZGAR.
Butternut, Wis.

Lazy, drowsy feelings are precursors of sickness which Hop Bitters will instantly banish.—*Adv.*

PERSONALS.

Captain Cook's one-cent fund in the Cincinnati Commercial amounts now to $800 from 80,000 subscribers.

Said old Cornelius Vanderbilt to a young man who came to tell him the story of how he had lost money by stock operations: "Sonny, don't ever buy what you can't pay for and don't sell what you havn't got."

"You're not worth your salt" said an Illinois farmer a few years ago to his daughter. "Yes I am" replied the damsel, and she insisted that henceforth her services must be paid for at the rate paid a servant for doing the same duties. The farmer had forgotten the contract when the daughter the other day, produced it and demanded $500, the balance due her—and got it, too, as she threatened to sue for it.

Implements and Machinery.

The Sedgwick Steel Wire Fence
Is the only general purpose wire fence in use. Being a strong net-work without barbs, it will turn dogs, pigs, poultry as well as the most vicious stock, without danger to either fence or stock. It is just the fence for farmers, gardeners, stock-raisers, and railroads; very desirable for lawns, parks or cemeteries. As it is covered with rust-proof paint it will last a lifetime. It is superior to boards in every repect, and far better than barbed wire. We ask for it a fair trial, knowing it will WEAR itself into favor. The SEDGWICK GATES, made of wrought iron pipe and steel wire, defy all competition in neatness, lightness, strength and durability. We also make the BEST and CHEAPEST ALL IRON Automatic or SELF-OPENING GATE. Ask hardware dealers, or for price list and particulars address
Sedgwick Bros., Richmond, Ind.

A $15.00 BREECH LOADING SHOT GUN FOR $5.50
WEIGHT 6½ lbs. LENGTH 4 ft.
THE SAXON BREECH LOADER

ONLY $5.50

THE SAXON BREECH-LOADING SHOT GUNS
Having been extensively introduced in ENGLAND and FRANCE, where they have given universal satisfaction; and, wishing to introduce them in the United States, we have concluded to sell a LIMITED NUMBER of this matchless weapon at a price which brings them within the reach of every one.
The **SAXON BREECH-LOADER** has a **Blued Barrel, thoroughly tested, guaranteed perfectly safe and accurate, case hardened, handsome stock,** and every part of it made of the very best material. Length 4 feet, weight 6 1-2 pounds. The improved patent breech makes it far superior to, and less liable to get out of order than any other breech-loading Shot Gun in the world.
Upon receipt of $5.50, and the attached Certificate, before March 1st, 1882, we will ship the above Gun to any address in the United States.

☞ CUT THIS CERTIFICATE OUT.—IT IS VALUABLE. ☜

Upon receipt of this Certificate, before **March 1st, 1882,** *with* **$5.50,** *we hereby agree to forward to any address in the U. S., one of our* **Saxon Breech-Loading Shot Guns,** *and guarantee it in every particular.* **SAXON IMPORTING CO.**

☞ CUT THIS CERTIFICATE OUT.—IT IS VALUABLE. ☜

The above offer is only made to introduce this incomparable gun in this country. To protect ourselves from dealers ordering in large quantities, we have concluded to **insert this Advertisement, one time only, in this paper,** hence require you to cut out the above certificate and enclose it to us with your order. We will not sell more than one gun to the same person, at the above price, and not then unless the order is accompanied by the above certificate. Our regular price is $15.00, and that amount will be charged unless order is accompanied by Certificate. **In no case** will we send more than one gun with each Certificate. If you do not wish a gun for your own use, you will have no trouble in disposing of it at a handsome profit. In selling samples of the **"SAXON" at $5.50 each,** we are making an **ENORMOUS SACRIFICE,** but we feel sure that one gun going into a neighborhood will sell ten more at our **regular price.** We wish to caution you against persons offering guns in imitation of the SAXON; to ascertain if the gun is genuine, see that the word "Saxon" is stamped on it. **The sporting papers** generally, join in praising **THE SAXON BREECH-LOADING SHOT GUN as being one of the most reliable Sporting Guns in the world. REMEMBER, this is a SPECIAL OFFER,** and will not appear again, as we wish to introduce the **SAXON BREECH-LOADER** in America as soon as possible. **We guarantee this Gun to be exactly as represented,** and will return the money if they are found to be otherwise. Should you desire it, we will **send the gun C. O. D., (with the privilege of examination) on receipt of $6.00,** to guarantee us against loss by Express charges. If we are strangers to you we refer you to any Bank or Express Office in New York City. For $1.00 extra we will send with the Gun, one of **Our New Sportsman's Cartridge Belts and 50 Metallic Base Reloadable Shells.** If you have friends in New York have them call and see us. Send money at our risk by P. O. Money Order, Registered Letter, or Bank Draft payable to our order. Address,

THE RURAL NEW-YORKER

A JOURNAL FOR THE SUBURBAN AND COUNTRY HOME.

VOL. XL. No. 1654.} NEW YORK, OCT. 8, 1881. {PRICE FIVE CENTS $2.00 PER YEAR

[Entered according to Act of Congress, in the year 1881, by the Rural New-Yorker, in the office of the Librarian of Congress at Washington.]

Biographical.

OUR PORTRAIT GALLERY.

Joseph Henry Gilbert, Ph. D., F. R. S., etc.

JOSEPH HENRY GILBERT, whose name, in conjunction with that of Dr. J. B. Lawes, is familiar to all students of agricultural chemistry, was born at Hull, Yorkshire, August 1, 1817. His father, the Rev. Joseph Gilbert, was the author of several theological works, and his mother, Ann Gilbert, who survived until 1866, was also well known as an authoress, writing before her marriage under the name of Ann Taylor, of Ongar. During his school-days he met with a gun-shot accident which greatly impaired his health for a considerable time and caused the loss of the sight of one eye. His college courses were begun at the University of Glasgow, and there, as elsewhere, he devoted special attention to chemistry, analytical and theoretical, under the late Professor Thomas Thomson. He next studied at the University College, London, where he had the benefit of Professor Graham's able lectures, besides working in the laboratory of the late Dr. Anthony Todd Thomson, then Professor of Materia Medica, Therapeutics and Toxology. To finish his course of chemical studies he next visited Germany, and spent some time in the laboratory of Liebig at Giessen, where he took his degree of Doctor of Philosophy. Returning to University College, London, he became class and laboratory assistant to Professor A. T. Thomson in the Winter and Summer sessions of 1840-41, and at the same time attended other courses at the college. On leaving the college, he devoted himself for a time to the chemistry of calico printing, etc., holding appointments in the neighborhood of Manchester.

It was in 1843, when in his twenty-sixth year, that he became associated with Mr. J. B. Lawes, of Rothamsted, then also a young man of twenty-nine, who had already been engaged for nine years in agricultural experiments—ever since he took possession of his entailed estate at Rothamsted in 1834. During the 38 years since then the two have been harmoniously engaged in a systematic series of researches in agricultural chemistry and physiology. The first of a long series of papers giving the results of their experiments appeared in 1847. These reports have been published from time to time in the Journal of the Royal Agricultural Society of England, the Reports of the British Association for the Advancement of Science, the Journal of the Chemical Society of London, the Proceedings and Transactions of the Royal Society of London, the Journal of the Society of Arts, the Journal of the Horticultural Society of London, the Journal of the Royal Dublin Society, the Edinburg Veterinary Review, the Philosophical Magazine, the Farmers' Gazette, the RURAL NEW-YORKER, and in several other agricultural papers, as well as in some official Government Reports, and elsewhere. For some years past there have been annually published memoranda of the origin, plan and results of the field and other experiments of Drs. Lawes and Gilbert, and in the issue for 1880 is given a list of 39 lengthy papers on field experiments, vegetation, etc., by both, one paper by Dr. Gilbert and Dr. Masters, and four papers, "On the Occurrence of Fairy Rings," "On Some Points in Connection with Vegetation," "On Rainfall, Evaporation and Percolation," and "On the Composition of Potatoes," by Dr. Gilbert alone. The experiments on feeding animals, and sewage illustrations, etc., comprise 20 papers by Dr. Lawes and Dr. Gilbert, and four papers by Dr. Gilbert alone.

In 1860 Dr. Gilbert was elected a Fellow of the Royal Society, and in 1867 the Council of the Society showed its appreciation of his work by awarding him, in conjunction with Dr. Lawes, the highest honor in its gift—one of the Royal Medals. He has been a Fellow of the Chemical Society of London since 1841, and is at the present time one of its Vice-Presidents. There is no branch of agricultural chemistry or physiology which the joint researches of Dr. Gilbert and Dr. Lawes have not enriched; nor is there any single laborer in the broad field of agricultural research, or, indeed, any society or association of workers in that field, to whom agricultural progress owes so much as it does to Dr. Gilbert and Dr. Lawes, whose honored names are inseparably associated in the grateful remembrance of agriculturists throughout the civilized world.

JOSEPH HENRY GILBERT--From a Photograph--Fig. 478.

Field Crops.

NOTES FROM THE RURAL FARM.

THE dry weather continues, and although this is the time generally preferred for sowing wheat, none in this locality save our own fields, has been sown and few fields have been plowed. We availed ourselves of a short rain, ten days ago, that wet the ground of our oat field two to three inches in depth, and dropping all other work, plowed the best way we could. The oat stubble had scarcely rotted; so that, though well harrowed and rolled, the surface was full of rubbish that rendered nice work in drilling in the seed an impossibility, the drill tubes clogging up continually and leaving frequent balks in spite of the attendance of a second man to free them. Whether it were wiser to have sown as we have done or to have waited, as other farmers are doing, for rain is a question which the weather of the next ten days will answer. The wheats sown in this field were: first, Oregon which, because of its hardiness, its large kernel and the strength of its straw, has been selected as one of the wheats which we shall continue to sow; second, Fultzo-Clawson of which our readers are likely to hear enough in the course of the next two or three years; third, Shumaker; fourth, Silver Chaff, and finally, Fultz which, for Long Island farmers promises to become as great a favorite as it is with our Western friends, as to yield at any rate, if not as to its flouring qualities. There is plenty of room for improvements in wheats, and it is our belief that ten years hence the kinds popular now will have had their day.

Already our wheat planted nine by nine inches apart is up far enough to mark the squares. RURAL readers will remember that we experimented with the cultivation of wheat planted (by hand) a foot apart either way, several years ago. The results were not very decisive one way or the other, and so we shall now have the opportunity of testing the system upon a more extended scale, should the season prove favorable and the dreaded Hessian fly not appear in formidable numbers.

Our experiment corn field! Are not our readers interested to know what has become of it? Let them bear in mind that the season of 1881 will long be remembered by the farmers of this part of the country as the most disastrous to corn that has occurred during the past 12 years at least. There is nowhere more than half a crop. Upon many farms, the corn was close upon an entire failure. Our readers will bear in mind also that the soil of the experiment field was very poor and except upon the fertilized acre, our sole hopes of a large yield were based upon (1) the varieties sown; (2) our peculiar system of cultivation and, last, though not least, upon a fitting of the land. Well, we are not yet ready to talk about this field, and the results of the several experiments attempted. But they are very interesting to us and, we trust, will prove instructive to those of our readers who cultivate this noblest of the cereals of America. One remark however we would make because it differs from opinions we have often seen expressed. It is that all of our upland corn, whether in or out of the experiment field, which was manured either with farm manure or concentrated fertilizers, was the first to suffer by the drought and the first to succumb. It seems natural enough that this should be so, since the more luxuriant the growth the greater is the need of water to sustain it.

Work of all kinds so presses upon us that it is difficult to do anything in a thorough manner and we feel like quarreling with those agricultural editors who at such a time can serenely talk of "forehandedness"—"keeping

everything in its place"—"destroying weeds"—"keeping things tidy" and are liberal with other well-meant advice of the same kind while stock is suffering and the crops of another year are in jeopardy for want of labor and time to give them immediate attention.

FLAX CULTURE.

PUSEY GRAVES.

In my experience in flax culture generally, but more particularly in Kansas, in order to render a crop profitable I have found it necessary to utilize both seed and fiber.

Preparation of Soil.—Plow in the Fall if possible; then, without stirring, harrow in the Spring before sowing as soon as the ground is dry enough. Sow broadcast, if for seed, one bushel of seed per acre; if for fiber only two bushels per acre; if for both seed and fiber one-and-a-half bushel per acre. Harrow well both ways or until the seed is well covered, and then roll. Any soil that will produce a good crop of corn will grow flax; but it must not be foul with weed-seed, as flax cannot be cultivated profitably if weeds are permitted to grow.

The Seed must be clean—free from rape, cockle and mustard, if one wishes to grow a marketable article of seed or a profitable crop of lint.

Harvesting.—In order to make the best fiber the crop must be harvested about the time the bloom falls; it will then possess a soft, oily feeling; but if the seed be allowed to ripen, it takes up the oil and leaves the fiber dry and harsh and more brittle, and lighter in bulk. When I wish to save the fiber and seed both, I allow one-fourth of the bolls to ripen. Competition in the market with jute-butts has to a great extent rendered the growing of flax fiber unprofitable in the West. Harvesting the crop must be attended to promptly when begun, if the weather be uncertain. It is easily damaged in wet weather. The old methods of harvesting with the cradle, the scythe and hand-pulling have passed away, and John and Mary as partners at the flax-pulling have gone to return no more. The Champion or Buckeye sickle is set close to the ground, and the rake and pitchfork do the work of 40 hand pullers.

The Value of the Crop.—It is safe to count on twelve bushels of seed per acre; it has often yielded 18 to 20 bushels here in Kansas, and its average value for the past five years has been for the whole State $1 per bushel. It has always been a surer crop and better yielder than wheat. When raised for the seed and fiber, the value of the crop is enhanced, as an average yield of fiber is 1,000 pounds per acre, which is worth $75 per ton, or $100 in St. Louis.

The experiences of farmers here have led to the opinion that the crop is exhaustive; that it leaves the soil colder and heavier and unfit to be followed by a crop of corn or oats, and hence to a great extent with many farmers the crop has been abandoned entirely. Flax stubble plowed under is a good preparation for wheat, and I have known the crop grown in Ohio preparatory to a wheat crop. Of late years we grow it here principally for the seed when grown at all, and feed the straw for hay, which is better than the prairie hay of the country and preferred by cattle. An average yield of flax straw per acre is half a ton.

The old water and dew rotting and breaking and scutching processes have all disappeared together with the hand loom and spinning wheel, that used to cheer the fire-side of the pioneer log cabins of the West. We have outgrown them all; but that we are more happy or more contented or more independent I very much doubt. The power loom and the ginny have taken the fiber from the distaff and given it back to the housewife in starched linen at rates with which she cannot compete. And unless the flax straw can be taken from the thrashing machine and the lint prepared for the manufacturer to compete with hemp and jute, the main object of the crop must depend upon the profit derived from the amount of seed that can be grown.

I have compared the reports to the Agricultural Society of this State, from 27 different counties, and the average yield per acre of seed is 12½ bushels, and the average market value $1 per bushel. The average cost in growing the crop, including the seed, is $5 per acre, leaving a net profit of $7.50 per acre. Nearly all the reporters agree that the flax straw is as good as Timothy hay for feed, and is to them valuable only for that purpose. Nearly all sold their crops as soon as thrashed, not having safe storage. My own observation has been, that clean seed in the Spring has been in active demand at from $1.25 to $1.40 per bushel for a number of years. I conclude, therefore, that the crop may be made profitable if made a specialty, and it is attended with far less hard labor than a crop of corn. An average crop of corn is 40 bushels per acre, and an average price in the West is 25 cents. The cost of growing and harvesting it is equal to that for flax; so that there are $2.50 per acre in favor of the flax. I am satisfied that if the rules I have given be followed, a good crop of flax may be grown almost anywhere in the temperate zone.

TOBACCO-GROWING NOTES.

My experiments with commercial manures for tobacco have not been satisfactory during the past dry Summer. As previously stated, I used a small quantity of the Swift-sure Superphosphate, Maryland Tobacco Food and Alkaline Bone Dust, applying them on a clay loam soil previously manured with barnyard manure in the drill over which the plants were to be set. From each of the three fertilizers a decided gain was noticeable, particularly from the Maryland Tobacco Food early in the season. But as the season advanced the difference in the appearance of the rows, where the application had been made and where none was used, was less visible until at last, when the crop was harvested, no effects from any of the several manures were clearly visible. I am not prepared, however, to lay aside all commercial fertilizers as of no value from the simple and unsatisfactory test I have given them. Had the season been a wet one, the results might have been very different.

Ordinarily about nine weeks are required for tobacco to cure properly. The leaves may be cured in a less time than this, it is true, but where the drying is rapid the quality of the product is inevitably injured. The more slowly tobacco can cure and yet escape poleburn, the better will be the quality of the leaf when cured. This fact may be proven by hanging a few plants in a cellar, or a very close, dark outhouse, as an ice-house. Here the leaves will cure very slowly, but when at last the natural juices from them and the stalk have escaped, the color and general quality of the leaves will be found admirable. This method of curing tobacco on a large scale is, of course, not practicable, but the nearer the approach to it the better.

There are very few farm crops that will stand a severe drought with less injury than tobacco, if the soil on which it is grown is in proper condition as regards fertility and tilth. The past dry Summer has proven that upon a well prepared soil a good crop is almost certain, provided the necessary care is exercised in setting the plants, and in the cultivation during the growing season. Our best tobacco farmers are, as a rule, gainers by severe droughts which shorten the crop over a large extent of country, because by obtaining large yields themselves, they reap the benefit from the advanced prices that are always paid for a good product in such seasons.

It is an excellent plan, after a crop of tobacco has been removed from a field, to run a harrow over the stubble or hills one or more times, which effectually destroys the second or after-growth of the plants, which undoubtedly draws from the soil valuable fertilizing elements, all of which are not returned to it again when the after-growth is killed by frost. The harrowing also destroys many weeds that would otherwise mature and scatter their seeds to the detriment of next year's cultivation.

It is advisable to seed a field after three successive crops of tobacco have been taken from it. A seeding to clover then is of great advantage, to be left a full year or more, after which, with the usual manuring, of course, tobacco may again be planted. The clover improves the condition of the soil, by enriching it, making it more mellow and more easily "worked," and leaves it in excellent condition again for tobacco. I have rarely seen a poor crop of tobacco grow upon a clover sod.

The danger of loss from "pole-burn" to tobacco is not confined to the first two or three weeks after the plants are hung up in the curing barn, as many suppose. The "burn" is caused by a peculiar condition of the weather, and may occur to tobacco after it is half cured. It is well to watch the weather, and tend to ventilation, so long as the plants contain any of their natural juices. G. A. G., JR.

Chemung Co., N. Y.

THE RURAL BRANCHING SORGHUM.

It is two months to-day since I first cut the above fodder plant; and the second growth is again cut, and fed to stock. It measured 10 feet in hight, and numbered from 25 to 30 stalks to the hill. The growth seems to me to be marvelous and will, I have no doubt, be discredited by many. But I can honestly say I have no interest in the matter except the good of agriculturists, who are fairly entitled to the benefit of everything that Mother Nature sends forth. The stalks of the second growth are not as thick as those of the first; they are about the thickness of a strong man's thumb, and the cattle relish them greatly. I ought to have weighed both cuttings, so as to show what could be grown on an acre, but I thought of it only when it was too late.

Our Summer has been a very dry one, and we have had only one rain for nearly two months. The Rural Branching Sorghum that I left for seed is *sixteen* feet high to the top of the seed spikes, and is one mass of seed. It still remains a deep green, and has been the admiration of everyone who has passed along the road. I have often wished that a perambulating photographer would come along, so that I could let you see how well it has done in Texas. It looks as pretty as any picture that ever appeared in the Rural, and that is certainly saying a great deal. It is certainly likely to prove a great boon down South. Mine has not been petted or pampered in the least. It received no sort of manure, liquid or solid, yet it has made so wonderfully luxurious a growth in a very dry Summer. In my opinion it deserves to be spread broadcast through the land, or at any rate through that large part of it adapted to its growth.

Our corn will not be over half an average crop; but cotton is doing well. The first "norther" of the season is blowing and the sorghum is bending like the masts of a ship in a gale.

Dayton, Liberty Co., Texas. G. G.

Specimens of Wheat Received Since the Special Wheat Number.

Scott Montgomery, Whitman Co., Wy., T.—Chili Club (heavy heads) five inches; Little Club, three inches.

G. N. Bradford, Mont, Co., O.—Bearded wheat, five inches.

A. J. Bishop, El Paso Co., Col.—26 Heads (unnamed) six inches.

John LaDow, Cedar Creek, W. T.—Little Club, 3½ inches; White Winter, Velvet Chaff, 4½ inches.

Thomas K. Donnelly, Jersey Co., Ill.—Unnamed, five inches.

M. N. Clark, Westmoreland Co., Pa.—Specimens look like the wheat sent out by the Agricultural Department, called Swamp and Yellow Missouri, 3½ inches.

D. Newton, Chehalis Co., W. T.—Blue Stem, six inches. Beautiful heavy heads with three and four grains in a spikelet.

Mrs. Leah Bean, Wabash Co., Ind.—No name, 4¼ inches.

H. E. Martin, Hardin Co., O.—Fultz, four inches; Clawson, five inches.

A. Y. Barclay, Lexington, Va.—Key's Prolific, 5¼ inches.

J. Dunlap, North Co., Pa.—Silver Chaff, six inches: Lancaster, five inches.

B. F. Davis, Williamson Co., Ill.—Patent Office Wheat, Swamp Wheat. [The former looks to us like the Silver Chaff.—Eds.]

C. M. Taylor. Address lost. Several specimens.

Delia M. Newton, Chehalis, W. T.—Beautiful heads of wheat of various kinds, also fine specimens of oats.

Yield of Various Potatoes.

Potatoes planted April 22, 1881, cut to single eyes:—

			Pieces.	Large.	Small.	Yield.
				oz.	lbs.	lbs.	lbs.
White Elephant.....	1 potato—		19	23	3½	26
Excelsior.....	1 "	—4	13	15½	5½	21
Snowflake.....	1 "	—4	12	10¾	4½	15¼
Beauty of Hebron....	1 "	—4	12	10¾	1½	12⅜
White Chester.....	1 "	—4	15	17	3½	20½

The above potatoes were planted in rows 18 feet long, three and a-half feet apart, each kind occupying one row. The ground was given a medium coat of barnyard manure last Fall. The soil was gravelly with a clay subsoil; had been cultivated five years. Those designated large are good-sized, merchantable potatoes. The yield of White Elephants would be at the rate of 269 4-5 bushels of merchantable potatoes per acre. They received flat culture: the soil was loosened up between the rows once with spading fork. The Beauty of Hebron and Snowflake were dug July 29; the White Elephant and Excelsior, August 22; the White Chester, August 26. The tops were about half dead when dug. There was an apple tree in the row of Snowflakes, which probably lessened the yield of them and the Beauty of Hebron in the next row.

Sussex Co., N. J. G. O. Wilson.

Who is Peabody and What is His Corn?

A short time ago there was some little conflict of idea expressed in the Rural as to whether a certain corn, which had the habit of multiple earing, grown in Ohio, was Peabody Corn or Blount's Corn. A correspondent of the Rural, if I remember aright, supposed the corn to be the Peabody Corn and so expressed himself, but afterwards submitted to correction. But, after all, it may be that this correspondent was right and that this Peabody Corn is a distinct variety. For I find it mentioned in Flint's Grasses and Forage Crops, which was published in May 1874, as an established variety at that time under the name of Peabody's Prolific. This corn I have observed is largely grown in Ohio and Kentucky where it is said to be an exceedingly productive variety. Now it would be interesting to know who Peabody was, and how his corn was produced and introduced. Can any one tell us? S.

Flax Raising in Kansas.

Flax will do well on almost any Kansas soil, but it prefers a heavy, black, sandy loam, which while new will produce a crop of from five to fifteen bushels. It can be sown any time in Spring, but on older ground it should be sown as early as frost is over, else the weeds or grass are apt to get started, which would be fatal to a crop. We cut it with a self-rake machine, leave it in the sun in gavels for one day, pick up with a barley fork, and stack; thrash at pleasure with wheat thrasher and separator. The seed is worth an average of $1 per bushel. Total cost of an acre, $5. Stock eat the straw and thrive on it. With mills or machinery for working up the lint the profit would be increased 100 per cent.; but we have no such convenience here yet.

Reno Co., Kansas. W. R. Austin.

STRAWBERRIES AND RASPBERRIES.

Stray Notes from Connecticut.

Another season's experience with some 20 of our new and well-known varieties of strawberries confirms my belief that

The Crescent Seedling is the most profitable berry for near market of any in general cultivation. What wonders the Manchester will do I have yet to learn. The only objections I have to the Crescent variety are, that it is a pistillate variety and yields fruit of inferior quality. But I think its good qualities more than make up for these two objections. In the first place, it will thrive well on almost any soil. Then, being such a rampant grower, I think it stands a better chance than most other varieties where the white grub is troublesome. Its enormous productiveness is another feature in its favor. It ripens with the earliest, and is of good shape and size. Then its bright scarlet color, together with its bright green calyx, makes it a very showy and attractive berry in the markets, and appearance goes a great way with the general customer. My first picking of Crescent this year was on June 8 and the last on July 2, and it maintained a good size throughout.

The Duncan, as an early berry of fine quality, I think stands without a rival. It is puffed but little by fruit-growers, for it is hardly firm enough to be called a good market berry; but I would recommend it more particularly as a berry for the family. It is an easy grower, and ripens a day or two in advance of the Crescent. The fruit is large, smooth and of delicious flavor.

The President Lincoln I am much disappointed with, as with me it is of little value after the first year.

Miner's Prolific promises well indeed. It yields profusely of large, deep, rich, red-colored berries, of good quality and sufficiently firm for near market.

The Sharpless does not come up to the standard I had hoped for it. True, it yields enormous berries of fine quality, but it fails to perform all it promises in the way of productiveness. Then the neck of the berry becomes over-ripe and soft while the tip is still white, making it, when fully ripe, wholly unfit for shipping. Mulching may, however, help about its ripening more evenly; but wherever I saw the Sharpless in market this season it was invariably with a half-ripe appearance.

The Forest Rose is of no value with me, as both plant and fruit have scalded badly the past season.

The Marvin is a weak grower on light soil, and too uncertain for general cultivation.

Hart's Seedling is an excellent variety for the home garden, being moderately productive and of first quality. The fruit is large, glossy, of deep-red color, very attractive, and sufficiently firm for near market.

Durand's Beauty, for a handsome berry, beats them all. It is, however, a shy bearer, and should be grown in hills.

The Glendale is a valuable market berry, but does not hold out as late as Kentucky or Kerr's Late.

Raspberries.

The Cuthbert I have fruited only in a small way, and am therefore able to give only a short experience with it; but from what I have seen of it I think it a most valuable variety and one that should be largely in every collection. Though not quite so hardy as the Turner, yet in size and quality it is far superior.

The Caroline is a variety that improves

steadily on acquaintance, and I think if its good qualities were better known it would be more largely planted as a market berry. From the first year's growth of canes one might think it a weak and tender variety, but it came through the severe weather of last Winter uninjured, while the Turner was somewhat damaged. Then, too, the Caroline is immensely productive of fair-sized, good-quality berries, firm enough to ship well. Although in flavor it is not quite equal to its parent—the Brinckle's Orange—yet, on account of its hardiness and productiveness, it is superior for general cultivation to any other yellow variety.

A NEW EARLY BLACK-CAP.—On the 12th of May of last year I received from Messrs. Hale Brothers, of South Glastonbury, Conn., three plants of a new early Black-cap to test. The plants were set in ordinary soil and only received ordinary attention. Though on an unsheltered spot of ground, and in no way protected through the Winter, not a cane was injured, while nearly all my other Black-caps were killed to the ground. When they came to fruiting I found them not only very early, but enormously productive. Such a quantity of berries I never saw before on year-old Black-cap raspberry bushes. If they yield proportionately as the plant attains age, a full-grown bush must be a wonder to behold. The berries are of good size, fair quality, firm and solid, and black as jet. With me it certainly promises much better than the celebrated Gregg of the same age. W. M. NASH.

Fairfield Co., Conn.

I AM really glad to learn that the Sharpless has not burned up at the Rural Grounds. I shall know where to come for a few plants, for mine are all gone, and I am sorry, for it is one of my favorites. I am afraid, however, that the editor did not quite understand me. I referred to the terrible drought rather than the liability of the plant to burn. The facts are now as follows:—First went the Sharpless, then the Red Jacket, next the Lincoln, and in quick succession the Shirts, Hervey Davis, Triple Crown, Bidwell, and so on to the end, the Downing enduring the heat the longest of all—a few plants still alive, but looking very melancholy. "Why didn't you water your plants?" Well, so I did as long as anything that looked like water was to be had; but even water got to be so dry at last that it did no good; and, in fact, we have been glad to get enough to make a show of clean hands and faces. I am trying to look at the facts from the cheerful side, but the truth is I am very sad. If I had been a woman instead of a man I might have kept my plants alive with my tears. Both my experimental plots look deplorable, even raspberries dropping their leaves. Blackberries look better, but have not grown an inch in a month. If I have ever seen anything like this before it was so long ago that I cannot remember it. I have saved a few untried things by dint of mulching and a little water, and that is all. These are cremation days.

MY experiments in preparing strawberry plants for planting came to an end weeks ago. The drought was too much for them, though not without its lesson in this direction.

THE drought and its effects have been about the only things talked of lately, the drift of conversation being in the direction of preparing for such a contingency in the future, and this certainly is wise. Farmers here and elsewhere began to cut corn to feed to stock about the middle of August, and in passing through the State of New Jersey to the Delaware River and over into a portion of Pennsylvania, during the second week in September, I scarcely saw a field of corn that was not either cut and stacked or being cut, the ears being about half formed. If there is half as much merit in the silo as is claimed for it, what an amount of fodder might now be saved that will go to waste. As far as I can learn, however, the silo, as at present constructed, is so costly as to cast serious doubts upon its economy, or at least to put it beyond the reach of the ordinary farmer. Is there no member of the RURAL family who has experimented with the silo in this direction, and who can give us reliable data as to the least cost? Every thoughtful man must see the wisdom of discussing the best means for preserving green fodder under such deplorable conditions as are now upon us. "In time of rain prepare for drought" must hereafter be an axiom in agriculture.

IT may be useful to those who have but limited space for wintering plants to know that most, if not all, of the tuberous-rooted begonias may be kept in a dormant state during the Winter. The set I use for summer-blooming I gradually dry off late in the Fall, and put in the cellar for the Winter, where they keep in fine condition, with a little water not more than two or three times. They will keep without any, but not so well. They must be brought to the light as soon as growth begins in the Spring. They bloom stronger for the rest. If the plants have been grown in the bed or the border, they may be lifted on the appearance of cold weather and placed in boxes. If cuttings be put in pots during the Fall they will make small tubers, varying in size from a pea to a hazelnut, and these, when well formed, may also be stored away till Spring, when they will make strong plants for Summer use.

SOME interesting and useful notes might be made on trees and shrubs in reference to their ability to bear a prolonged drought. In the midst of trees and shrubs going into "the sere and yellow leaf" almost before half their growth is completed, it is cheerful to see one here and there which preserves its freshness and color, like a gleam of sunshine lingering on a scene of desolation. Such plants preëminently are the Cercis Japonica, Styrax Japonica, the Wistaria and the Ailanthus, all growing in a soil even lighter than that of the Rural Farm, and yet with their greenness undiminished by three months of drought. A few others could be added to the list, but these deserve to be specially mentioned, preserving, as they do, the spirit of life and greenness where almost everything else seems dead or dying. HORTICOLA.

Pokeweed Destructive to Apple Trees.

From observing and experimenting I am convinced that poke, pokeweed, scoke or garget (Phytolacca decandra) is highly poisonous to the apple tree. The result of my observations and limited experiments may be the means of saving many valuable trees. In not a single instance where poke was allowed to grow within the rootspread of an apple tree did the tree survive. Apple trees in stages of decay having poke growing within their rootspread, have been saved from further decay and often rejuvenated, by the destruction of the weed. I think that most apple trees, once fairly grown, that die in this locality do so from the effects of poke growing near them. The time of an apple tree's life after poke is once established beneath its foliage, is limited in proportion to the number of poke plants that become established—the greater the growth of poke the shorter the life of the tree. I think pear trees are also destroyed by poke. C. W. GOOD.

Farm Topics.

FAIRS AND THEIR USES.

R. GOODMAN.

AUTUMN and the harvest turn men's thoughts toward country occupation and sports in England, and it is considered a great hardship if even Parliament continues in session after the shooting season commences. It would be a greater grievance if there was not an adjournment of the National Legislature so as to allow the members to be present at the "Derby," where "all the world and his wife" have gone from time immemorial. Our ancestors who settled in this country on the shores of New England came over before the great revolution in public sentiment, effected by the Restoration of 1660, when the Royalists came back as the party of reaction; when virtue was a public laughing-stock; when the "heroic age of England had passed away, not by gradual decay, by imperceptible degeneration, but in a year, in a single day, like the Winter's snow in Greece." They came during the long-continued struggle for constitutional rights with an arbitrary king, and only desired a home where they could "glorify God and enjoy the presence of their dearest friends" without hindrance or persecution. The bulk of these emigrants were farmers from Lincolnshire and the eastern counties of England, and they had been so harried under the Stuarts by the enforcement of games, bull-baiting and other harsh sports at unseasonable times, and even pastimes on Sunday—every minister on certain occasions being ordered to read the royal declaration in favor of such pastimes from the pulpit, under the penalty of being deprived of his living if he refused—that our Puritan forefathers naturally passed to the other extreme and avoided all those festive scenes so common at home. "Thanksgiving" was established very early as a season of prayer, church-going and moderate feasting, but the country had got well settled before the inauguration of "fairs."

Elkanah Watson, a merchant of Albany, N. Y., was the real author of the present system of fairs and cattle shows sustained and directed by agricultural societies, and the first one was held under his direction at Pittsfield, Mass., where he had a farm, in the year 1810. This was such a success that Watson soon after proceeded to organize agricultural societies and to establish fairs and cattle shows in other places, and now in every State of the Union there are more or less of them, and many are supported in part by legislative aid.

The word "fair," kindred to the Latin *feria*, a "holiday," has resumed with us its original meaning, and does not mean in the United States a mere temporary market for the sale of goods and merchandise, but a grand turn-out, for one or more days, of the agricultural population and their neighbors to exhibit and be exhibited, to eat, drink and be merry; to scan everything new in the way of implements, vegetables and household goods; bring their own and examine others' cattle, sheep, pigs and hens; try the speed of their own and their neighbors' horses, and at the end hear from some selected orator somewhat too fulsome praises of agriculture and its operations. With most, even of the farmers themselves, this is about the beginning and end of the Autumn festival, and aside from the premiums they may obtain, the gratification of a reasonable curiosity, the excitement attendant upon all large assemblages, and the enjoyment of the wives and children at this annual outing, they return to their farms content to delve again until another twelvemonth brings round a repetition of the show.

Allowing that the main purpose of these gatherings is, as it should be, the recreation of the hard-working class which composes one-half the population of the country and is the main-stay of its prosperity, the earnest farmer, the young, progressive man will find in them something more than mere amusement and leave them with a store of information which he will put to good and profitable uses. The farmer is not an inventive person—every implement he uses has been created for him, and generally by those outside of his calling, and even the continued improvements in the machines adapted to his business are suggested by the inventors or machinists who construct them. But the intelligent farmer can at these "fairs" not only learn something about the growth of crops of every kind, the varieties and improved breeds of cattle, but he can discern the value of the newly-invented machines and tools adapted to his business, which will not only make his personal labor easier, but obviate the necessity, in part, of that costliest of all of the expenditures on the farm—laborers' wages. The farmer who in this age does not in this way take advantage of these annual fairs to improve his condition is behind it—is one of the old fogies whose succulence is diminishing, and he will soon be but a dried and poor stick compared with those about him, whose eyes and ears are open and who can catch fortune as it flies. Aside from the advantages above set forth, there is not much to be gained at fairs in the way of inciting to intensive agriculture.

The efforts to make experimental stations of them have proved a failure; the men who conduct them have not the scientific education needed to carry out any system of chemical tests, hardly the ability to weigh and measure the crops upon which premiums are bestowed. On the other hand, the indiscriminate bestowal of premiums has a universal and somewhat degrading tendency, causing such slight jockeying as removing the best stalks of corn from different parts of a field and replanting them in the acre to be reviewed; denuding the rest of the farm of its proper proportion of manure so that the premium acres should be enriched even beyond their good; bestowing unnecessary time and attention upon the crops and articles to be entered for prizes, and making the acquisition of "spoons" the leading motive of the year's work.

But the crying evil of the combined fairs and cattle shows is the improper selection of judges, especially in the cattle departments. The New England Agricultural Society, which holds an annual fair in one of the Eastern States, and solicits contributions from the whole country, has always had a pernicious system of appointing judges from among its own members, and most of them upon the grounds on the opening day of the fair, when men are got in who may be more or less interested, and are usually incompetent, instead of selecting from States outside of New England breeders especially acquainted with the cattle they are to judge. The New York State Agricultural Society, on the other hand, is very particular in the selection of good judges from outside of the State to examine and award premiums upon thoroughbred stock, and consequently such awards have a value which exhibitors appreciate and purchasers rely on. At the local fairs in every State this evil of ill-selected judges is always prominent; but since the great increase of valuable neat stock there is a movement for its eradication, and farmers of influence cannot better subserve the interests of their sections than by inaugurating reforms in their societies, which will classify the cattle exhibited, apportion them in sheds, and provide judges for each breed competent to pass upon their merits. Horse-racing at fairs will continue to be a prominent and attractive feature; but the horses should be owned within the jurisdiction of the fair and a stop be thus put to the practice of allowing a vagrant, bony, leather-covered animal to come in at the last moment and carry off all the money, to the general disgust of competitors and exhibitors.

Our agricultural fairs are necessities—good safety valves for the whole population—and only need intelligent management to make them instructive as well as interesting, and the farmer who fails to reap some advantage from them to himself and his occupation is wanting in intelligence and enterprise.

Lenox, Mass.

Covering Weeds with a Plow.

The remarks of "S. T. T." upon this subject (page 634) require some explanation. I have used this device nearly every year since 1850, and although it was patented in 1866, "S. T. T." should have coupled with his statement to this effect that the Commissioner declared the granting of the patent to be an ignorant and egregious blunder of the Commissioner of Patents, in view of the fact that the device was then an old one in common use. Farmers need have no fears of claims for royalty growing out of this fraudulent patent-right after this statement of the Commissioner of Agriculture in the very year the device was patented. The short drag chain mentioned by "S. T. T." is totally useless. A trace chain with a piece of rope for the forward part of the loop is heavy enough unless the weeds are very stout, when two trace chains or a light ox-chain will be more than heavy enough. In the illustration in the Agricultural Report the chain is fastened too far forward on the plow-beam. If it be attached to the plow standard as described in the RURAL of August 20, it is just right. In fact, the RURAL'S description is correct in every way, as "S. T. T." will find if he will try it and not mind the so-called invention in the Agricultural Report. H. S.

Societies, &c.

MICHIGAN STATE FAIR.

[Special Report for the RURAL NEW-YORKER.]

THE 33d annual fair of the Michigan State Agricultural Society was held at Jackson, Mich., Sept. 19 to 24 inclusive. The weather was all that could be desired and brought out large crowds, the attendance being over 15,000 on Wednesday, and over 25,000 on Saturday. The receipts for the week ran up to over $28,000, leaving a handsome balance in the hands of the Treasurer. The show in all the departments was very large, and the fair in every way a success. Against the wishes of a large number of the members of this Society, side-shows, chariot races, etc., were allowed, and it is to be hoped that at the annual meeting in January, enough members will turn out and protest against this so that another year this nuisance will be for ever banished. The constitution of this society does not allow such exhibitions and a protest, if put in, can be enforced.

The horse element has a pretty strong hold and real agricultural horse trots took place every day; but as the premiums were what might be called breeders' premiums, style and action in some cases offsetting speed. The show in this department was very large, there being 548 entries, and the stock, especially the heavy draft animals, were good.

In cattle there were 510 entries, including no less than 34 herd entries. The Short-horns made the largest showing, there being 10 herds and a large number of single entries as well as some remarkably fine Short-horn grades. Here they breed more for beef than milk and many fine, large animals were shown. Messrs. Wood, Brooks, Phelps Bros.; Mixon and Shaw were the largest exhibitors. Most of the herds were headed by young bulls, and I noticed a lack of fine aged bulls not only in this but in other classes. There were only two herds of Devons, the show not being nearly as large in this class as at Elmira. Messrs. Leich and Burrows were the exhibitors. Holsteins showed up finely, five herds being entered and on the grounds were a number of smaller entries. The Holstein is growing in favor in this section. Messrs. Phelps, Underwood and Smalley were the largest exhibitors. Messrs. White and Col. Rodgers showed fine herds of Ayrshires and the entries in this class footed up well. The show of Jerseys was remarkably fine, but not as numerous as at Elmira. I hope to be able to furnish the RURAL with a photograph for a picture of the Jersey bull Spiræa's Lennox that carried off the first premium at the head of the Clover Lawn Herd. Messrs. Dean, Bates, King, and Kingman, were the

largest exhibitors in this class. There were seven herds of Herefords on exhibition and they made an excellent showing. Messrs. Burleigh and Bodwell, of Maine, carried off the first premium on herds and also 23 other premiums on their other exhibits of Herefords and Polled Angus, amply repaying them for their long trip. The Herefords are more popular in this State than in New York, and the breeders here show marked improvements in their exhibits over previous years. The Maine exhibit numbered 23 head and the next largest exhibitors were Messrs. Phelps and Seeley's and Parsons of Ohio. Two fine herds of Polled Angus (or Galloway's as they are here miscalled) were exhibited by Messrs. Burleigh and Bodwell of Maine, and R. B. Caruss of St. John, Mich. These cattle have been talked of considerably in the RURAL and I heard more than one prominent breeder on the grounds here say that they promised to be the coming breed in this country. They improve with acquaintance and it seems highly probable that in time they will turn out to be in this country all that the RURAL has claimed for them. The Maine herd had at its head the fine yearling bull Highlander, and carried off first premium. The Michigan herd was headed by the four-year old bull Lord Lochienor. I hope to see both of these bulls pictured in the RURAL later on.

The show of sheep was simply immense, 414 entries competing. The Merino exhibit was very fine, some of the best sheep in the State being present. The show in middle and long-wools was large but not up to that of the fine-wools in quality.

There were 160 pens of swine—not as many as I expected to see here, but the quality made up for the lack in quantity. It was difficult to get names of breeders in these classes; and I would recommend the society to adopt the N. Y. State Ag'l Society's plan of numbering and cataloguing the exhibits as a great assistance to visitors.

The poultry show was in a building adjoining one of the side-shows, and the noise of the two was sufficient to satisfy the most enthusiastic amateur. The display was not large, but good, and would have attracted more attention if it were not for the side-show band.

The fruit, flower and vegetable hall was well filled. Fruit looked better here than at Cleveland, Pittsburgh or Elmira. Apples, pears and grapes showed the effect of the long-continued drought, but not as badly as at the places above mentioned. The RURAL'S correspondent, J. S. Woodward, made a handsome display of Niagaras that looked as though there had been no drought in his section of New York. The vegetable and cereal exhibits were very large, showing that the Michigan farmers must either pay more attention, as a rule, to farm gardening than the farmers of other States, or that they think enough of their farmer friends and their State Agricultural Society to bring forth the best of their products and show what can be done. This department would put to shame all the Eastern fairs that I have yet seen or heard from. Among the large wheat and grain exhibits I noticed a handsome display made by Chas. Grant, Thornbury, Ont., Canada. Right here I think that Golden Grains or Black-bearded Centennial is coming in again at 25 cents for a small package under a new name—viz.: "French Spring." Several heads of this would-be new sort were placed alongside the illustration of the Black-bearded Centennial in the RURAL Wheat Special, and the general opinion was that they were identical.

Domestic Hall, as usual, was well filled.

The agricultural implement show was the largest I have ever seen on a fair ground outside of St. Louis. There must have been at least 20 acres filled with all the latest improved machinery. There were over 20 portable and traction farm engines in operation. Right here I must protest against the running of self-propelling engines around the grounds indiscriminately. If there is any use for a track on the grounds of an agricultural fair this is what it should be used for. After two or three people have been run over and killed, the present reckless practice may be stopped—*better stop it now.* There were acres of thrashing machines and clover hullers in full operation with steam or horse power. Twine and Wire self-binding harvesters of all descriptions, were in full force; while grain drills, cultivators, plows etc., were there by the hundreds. Although a number of great improvements were shown in different machines, I noticed only one new one. It was a combination Spring Tooth harrow and drill on broadcast seeder principle, made by B. S. Williams & Co., at Kalamazoo, Mich. The displays of the large mower and reaper concerns, such as Walter A. Wood, Bradley, Johnstons, Gregg & Co., and others, were run by shaftin so that farmers could see the principal points of the different machines. The large plow concerns made some elegant exhibits, their plows being finished and polished in the most skillful and artistic manner. The Gale M'f'g. Co.; the Oliver Chilled Plow Co.; the South Bend Plow Works were particularly noticeable in this respect. This is the country of spring tooth harrows and there must have been an acre of them. One of the pleasant incidents of the fair was the presentation to Superintendent Hanford of a handsome gold watch and chain: he has been General Superintendent of Machinery Department for 12 years.

The old reliable house of P. P. Mast & Co., Springfield, Ohio, who have a larger business in their line in this State, than any other manufacturer, and claim to have sold more drills in Michigan during the past season than all their competitors combined, made the largest and most varied exhibition of drills on the grounds. Recognizing the fact that no drill is adapted to all kinds, and conditions of soil, and having a trade that covers every State and Territory in the Union and also nearly every country where wheat is grown, this enterprising firm is now building and had on exhibition here Buckeye spring pressure drills for hard ground; Buckeye shoe drills for sandy and mellow soil; Buckeye fertilizer drills for soils that need enriching; three and five-hoe Buckeye drills for drilling wheat among standing corn and the old reliable Buckeye force-feed hoe drill which for the past 20 years has been well known to our readers. Another great improvement shown by them was their new Buckeye spring tooth harrow, which was lately illustrated in the RURAL, and which promises to meet with a large sale, as it fills a want long felt for some thing that would work the ground finer than a cultivator in preparing for wheat and do away with the annoyance of breaking pins or straining cultivators on stony or rough ground. By a lever at the side of the driver's seat, the teeth can be forced into the hardest ground and kept from running too deep if the ground is mellow, or made perfectly adjustable to follow the surface. A seeder can be attached for such as are in favor of broadcast seeding. They also exhibited a full line of Buckeye broadcast seeders, cultivators, plow sulkies, cider mills, etc.

The Albion M'f'g. Co., Albion, Mich., made a fine display of their new Albion spring tooth sulky harrow and cultivator with broadcast seeder attachment. The advantages claimed for this over ordinary dragging harrows are lightness of draft, adjustability of frame by which pitch of teeth is governed, and the perfect manner in which it follows the surface of the ground. A simple device governs the depth to which the teeth penetrate, and any boy old enough to manage a team can work it either from the seat or on the ground while the harrow is in motion, and hold the teeth in hard ground or regulate their depth in mellow or soft soil with perfect ease. By simply removing two teeth the harrow is convertible into a corn cultivator. It is provided with a pole adjustable for either two or three horses, and always follows the line of draft and the teeth will not track on sod ground or hill-side. When desired, an excellent broadcast seeder attachment is combined with it, making three perfect implements in one. A large number of these machines are now in use both East and West and are giving complete satisfaction.

W. H. K.

40th Exhibition of the Queens Co. Agricultural Society.

FIRST PRIZES ALL AROUND TO THE RURAL FARM EXHIBITS.

FIRST PRIZE TO THE

RURAL HEAVY DENT

AS THE BEST WHITE CORN.

First Prizes to Wheat and Oats.

[RURAL Special Report.]

NEXT only in general importance to the State Fair of New York is this of the above Society. The almost unprecedented drought which has injured or destroyed all late crops, and especially corn, on most parts of Long Island, would naturally have the effect to discourage farmers from entering products which there was reason to fear could neither reflect much credit upon themselves nor prove objects of interest to visitors. Nevertheless, the entire display, though inferior in quality, less in quantity, and far less varied than in the average of previous years, was remarkably full and excellent to the eyes of those whose lands have suffered the full extent of the drought. The products from the Rural Farm were viewed with notable favor and many were the complimentary remarks passed upon them. Every entry received a first premium. The awards were as follows:—

1st. For the heaviest and most perfect 12 ears, any number of rows, of white corn. Awarded to the RURAL HEAVY DENT.

2nd. For the heaviest and most perfect 12 ears, any number of rows, of yellow corn. Awarded to the Chester County Mammoth.

3rd. For the greatest number of best varieties of wheat exhibited in the straw. Awarded to the RURAL collection of 60 different kinds.

4th. For best sample of wheat, 50 heads, in the straw. The premium card was displaced so that we did not ascertain to which of our varieties this first premium was awarded.

5th. For the greatest number of grains and best varieties from one exhibitor. Awarded to the RURAL'S entire exhibit of corn, oats and wheat.

6th. For greatest number of grains to a head, bald and cultivated. This was awarded to one of the RURAL wheats originating upon the Rural Farm and not yet named.

7th. For the largest number of grains to a head, bearded and cultivated, in straw. This was awarded to another of the RURAL wheats not yet named.

8th. For the greatest number of varieties of oats. This was awarded to the RURAL collection of oats.

9th. For the best sample of oats, 100 heads, in the straw. This was awarded to Mold's Ennobled Oats.

10th. The best sample of hulless oats. This was awarded to Pringle's hybrid hulless Excelsior Oats.

The field from which the prize ears of the Chester County Mammoth were selected was manured with 400 pounds to the acre of Bowker's corn fertilizer. It is the same field upon which the great yield of Blount's Corn was harvested last year.

The field from which the prize ears of the Rural Heavy Dent were selected was manured with 600 pounds (upon one acre) of Mapes' corn manure. It is the corn experiment field of the present season. The rest of the field—save the special plots of one-twentieth of an acre each—received no manure of any kind, as our readers will remember.

Mr. Aaron A. De Graw in the cattle department exhibited some splendid Jerseys. He received the first premium for Jersey bull, "Pride of the Island," two years and four months old, a portrait of which noble animal we hope to present in a future number.

Mr. Davison took the first prize for Jersey bull (Ben Nevis) one year old: W. J. H. Kenyon for a fine Guernsey bull two years old, "Stuben Forest;" David Carll for a three-year-old Ayrshire bull, also for several Ayrshire cows and calves. Of thoroughbreds only Guernseys, Jerseys and Ayrshires were entered, though premiums were offered also for Short-horns, Holsteins and Devons.

In the implement department we saw nothing that has not frequently been alluded to in these columns.

Contrary to all reasonable expectations, the attendance was large. But the management of this fair is so complete, the grounds so ample and well suited to exhibition purposes, that visitors find plenty of enjoyment and more than enough to engage their attention for a single day. "MAJOR."

KANSAS STATE FAIR.

[Special Correspondence of RURAL NEW-YORKER.]

TOPEKA, Kansas, Sept. 22, 1881.

THE first annual fair of Kansas was opened on Monday, the 12th, under the most favorable auspices. The buildings were nearly all new and built without regard to expense, probably being as good as can be found in the West. The building for sheep was especially good, and might well be copied by older States. In the Stock Department there was a fair exhibit. There were several herds of Short-horns that would compare favorably with the Short-horns found in older States. The exhibit of Jerseys was small, and hardly up to the standard of that popular breed. In Holsteins one herd of ten head was exhibited, which were good.

In the Swine Department there was a large exhibit, mostly of the Poland-China breed, though several pens of the Berkshire and Jersey Reds were on exhibition. The exhibit of horses and sheep was small, though there were some fine animals shown, notably the imported Clydesdale stallions.

In the Horticultural Department the display of fruit was in all respects very fine, comprising over 1,800 plates, and the fruit appeared to be of the best quality. Douglas Co. exhibited 115 varieties of apples and 10 varieties of pears and as many of peaches. Leavenworth Co. exhibited 125 varieties of apples, 30 of grapes, 30 of pears, besides many samples of small fruits. Abner Allen, of Riley Co., exhibited 80 varieties of apples, besides many varieties of grapes, pears and peaches. Washington Co. exhibited 30 varieties of apples.

The State Grange of Kansas offered for the largest and finest collection and display of farm products, including the garden and orchard, $300 for first premium, $200 for second, and $100 for the third. Four Granges competed for these premiums, and the exhibit from each Grange was especially fine. Capitol Grange, of Shawnee Co., won the first premium. In fruit they exhibited 100 varieties of apples, 15 of grapes, 10 of peaches, and 8 of pears. Neosha Grange, of Lyon Co., won second premium, and Lone Elm Grange, of Johnson Co., third premium. The Lone Elm Grange exhibited 97 varieties of apples, 15 of grapes, 14 of pears, and 6 of peaches. The Atchison and Santa Fé Railway Company made an exhibit of fruits and products of ten counties in which their road runs, which was simply grand, and no one could leave the building with any doubts as to the future of Kansas.

On Thursday 25,000 people attended the fair. The Secretary said there would be money enough to pay all expenses and leave some in the treasury. The first annual State fair of Kansas may be set down as a great success. D. W. C.

Dairy Husbandry.

SKIM CHEESE AND "ANTI-HUFF."

L. S. HARDIN.

THE line of demarkation between an honest imitation and an adulteration of our food products is not always easily drawn, and the manufacturers of the genuine article are claiming that the imitation is a fraud and a great injury to them. In the process of butter making there is a large residuum—butter-milk and skim-milk—that in the private dairy can be profitably disposed of on the table or in cooking and feeding to fowls, pigs and other domestic animals. Thus the loss, if there is one, is not felt so long as butter making is confined to the farm. The erection of creameries or butter factories, bringing together thousands of gallons of milk daily to be made into butter, left, of course, an immense quantity of skim-milk and butter-milk on the hands of the factory owners. It became necessary that they should devise some means for making a profit out of this material. At first hogs in large numbers were purchased to consume it, but the immediate proximity of a large pig-pen to a butter factory is not a desirable state of affairs. Milk and cream are too sensitive to bad smells to remain unpolluted when exposed to a breeze from the direction of the pens.

Pipes a half mile long were often used to carry the milk to the pens, but without removing the trouble. After pigs had proved a poor shift, calves were tried with somewhat better results, so far as the quality of the butter was concerned, but not always with equal profit, as it is much more difficult to handle and raise calves than pigs in large droves and upon one article of diet. Later came the art of making the factory skimmed cheese hard and leathery as it was, and there has generally been more profit in it than in any other method of disposing of the skim-milk. Then, to give it a reputation to start on, only one-half the milk—the night's or morning's supply—was skimmed, thus leaving one-half the cream in the cheese. This was what the Sunday School books call the first step in a downward course. As the price of butter would rise, the creamery hands would skim closer and closer until the dealers either absolutely refused to accept the cheeses or prices for them fell below the cost of transportation.

In the competition between factories to declare the largest dividends to their patrons or owners, invention was called upon to supply the oil taken off with the cream, and this caused the first use of oleomargarine and for a time it was thought this oil would entirely supersede the use of cream even in making the finest quality of cheese. That bubble burst, however, and a new substitute has been devised called "anti-huff," it seems that when this hard, skimmed cheese is subjected to a high temperature it swells, puffs, or, as it is called in the vernacular of the cheese monger, "huffs." So to speak, it gets its back up, and looks not unlike a baked dumpling. Then it rapidly becomes too high-flavored until absolute putridity sets in. The flavor follows these changes with rapid steps from off flavor to sharp, sour and bitter, when the whole article is usually dumped into the sea. Worms have nothing to do with these changes—they do not like skim cheese. The whole trouble comes from the formation of acids and gases due to age without ripening. A cheese properly made will go on ripening almost indefinitely, but if not correctly made, decay takes the place of ripening. To prevent this puffing in cheese made of skim-milk and butter-milk several parties have within the last two or three years been putting upon the market a compound for allaying this tendency. It is generally supposed to have for a base some alkali, as potash, which by chemical action holds in subjection the gases that cause the cheese to huff.

These chemicals rarely stand still but generally insist upon forming one gas or acid or another. Their presence utterly precludes any

idea of ripening in the cheese. The alkali, however, holds the cheese in apparently good condition long enough for it to get fairly launched upon the market and well out of the hands of the manufacturer. But as evil doings are said to be not unlike to chickens that come home to roost, the maker is very apt to hear from his cheese if it should not be consumed at an early day. This has brought about some hard feeling between makers and dealers. I noticed some months since that a dealer in the Elgin Board of Trade had sold 250 of these anti-huff cheeses and then had them returned on his hands at a total loss. Another, we are told, exhibited in the Board of Trade an anti-huff cheese which was in such a demoralized condition that its maker couldn't possibly have recognized it. The alkali used in it caused it to smell like three soap factories consolidated. That one cheese should convince all factory-men that anti-huff is worthless and a trifle risky to use not only so far as the preservation of the cheese goes but for healthfulness. In support of this last point Dr. Teft at the same Board some weeks before the above occurrence, displayed a part of a stomach that he had subjected to this alkali, and it was nearly eaten away, a condition highly suggestive of its effect upon the human stomach, when used as an article of food. This anti-huff has taken for one of its fields of operation the Northwestern dairy section and it has played such havoc with the Chicago cheese dealers that we find them in arms against it.

On the other hand, Messrs. Whitman & Burrell, who are owners of one of these anti-huff patents and therefore not altogether disinterested witnesses, claim that the mixture was not the Simon Pure article; that the latter is meeting with complete success at their own factory and in those of their neighbors; that a cheap food supply demands that this skim-milk and butter-milk should be utilized; and that when properly made the genuine anti-huff contains no more potash than many other good and wholesome articles of diet. Between these claims I suppose one must let the quality of the cheese decide, which it in time will certainly do, but, in keeping with the practice announced in the war on oleomargarine, I can see no reason why this doctored cheese should not be sold for just what it is, and, for the matter of that, so should buttermilk and skim cheeses. All of them should bear upon their faces a plain and legible brand honestly designating what they are. The workers in anti-huff have formed an alliance with lard cheese, and one being about as good and honest as the other, I can see no legitimate objection to the union; but it looks advisable for dealers in honest goods to leave the whole thing alone.

The Herdsman.

GOATS.

THAT estimable lady the Baroness Burdett Coutts, now, by her marriage with an American gentlemen, Mrs. Ashmead Bartlett, is well known to be a most benevolent and philanthropic person. In pursuit of her benevolence she has of late made some persevering efforts to induce people to keep goats for the furnishing of private family dairies. Under her patronage and aided by some of the English aristocracy a British Goat Association has been formed, every member of which is pledged not only to think and speak well of the goat, but to keep one of these animals and to induce others, especially the poorer persons who are unable to keep cows, to procure goats and keep them for the sake of their milk. Not only is this idea prevailing in England and the goat under this fashionable patronage, holding up its head, so to speak, but some persons here in America are taking pains to make the goat popular. A leading daily newspaper recently in a conspicuous manner, made an attempt to palm off the goat upon us by giving it false and mistaken credit for being a valuable dairy animal. It even went so far as to state among other particular claims to this unwarranted merit, that the well known and delicious Roequefort cheese was made from goat's milk, and suggested in a somewhat indefinite manner that to the goat we owe the Neufchatel and the Brié cheeses. Now the goat by no means deserves this high credit, for as a dairy animal it is a delusion and a fraud, and there is no particular cheese that owes its existence or character to the milk of the goat. The Roequefort cheese is the product of ewe's milk and not of that of goats. A few goats are kept among the flocks of sheep at Roequefort; but among the four or five hundred thousand ewes kept there, there are but a dozen or two of goats, and the popular Neufchatel and Brié cheeses are made of cow's milk, so that the goat is given a credit that does not belong to it and the truth should be told lest the public should be led astray.

In fact there is nothing about the goat that is to its credit as a domestic animal except its voracity in regard to waste paper and rubbish which it disposes of greedily and is thus cheaply fed; but, on the other hand, there is much to be said to its discredit for its destructive habits. A report comes from Cyprus that this unfortunate island is desolated by the Cyprian goats, which have utterly destroyed the groves and woods and now prevent the growth of any more by their avidity for bark and browse. We know something of the goat here already, but so far there is nothing lovely or desirable about it, and all the service it has done has been to give a small quantity of milk in return for a hundred times its value in damage to gardens and shade trees and a thousand times the value in annoyance to the neighbors of the owners.

Breaking in Heifers to the Milk-pail.

The following is my method of breaking a heifer to be milked, etc.—After the calf has drawn the first milk from the udder, I secure the heifer by tying the head close to the manger. Then I have ready a strap about seven feet long, with a buckle on one end and holes made one-third of the length from the other. If the heifer is wild, never having been handled much before—which is frequently the case here in the West—I use a small forked stick to catch the end of the strap under the heifer, the other end being gently laid across her back just in front of the hips. The strap is then gently drawn tight—pretty tight if the animal is wild. She will probably abominate the arrangement the first time, and will very likely not be in love with it the second, but I have yet to meet the heifer that was not broken in, and that thoroughly, by this means. No heifer so girt can kick, nor get away, and if one is kind to her she quickly and quietly "accepts the situation." Although I have invariably used the strap, I have never seen any ill effects from it, and would strongly recommend it. H. T. BURRIS.

The Poultry Yard.

POULTRY FOR THE MARKET.

A LITTLE extra care and attention in preparing poultry for market will be well repaid, in the end. It is quite essential that the birds should reach their destination with a good appearance and in good condition, if fair prices are expected; hence it is for the shipper's interest to take every precaution to have these two requirements fulfilled.

The practice of "stuffing" the fowls with cooked meal or anything else in fact, for a day or so preceding their shipment, is unwise. If the food is not well digested before the fowls are killed, fermentation and putrefaction take place, and the result is that a greenish, putrid look is given the dressed fowl, and it becomes unfit for the table. It is not a good plan to let fowls run at large just before they are marketed, as the unwholesome food they are liable to pick up may taint the flesh, unless it has time to become thoroughly digested and assimilated. Moreover, they should have no food whatever for ten or twelve hours before killing.

Much depends on the manner of killing fowls to have them marketable. The best method undoubtedly is to make an incision well back in the roof of the mouth with a sharp-pointed knife, and divide the vertebræ or touch the brain. This causes instant death. The head and legs should be left on and the entrails not be "drawn." If the legs and necks of turkeys and chickens are dry-picked immediately after killing, they are not as apt to become discolored when exposed to the air. Very fat poultry may be dry-picked to advantage, as it sells a little higher and will carry a little better from distant points, but it does not improve the appearance of somewhat lean fowls.

In scalding, the water should be boiling-hot, and all pin-feathers should be carefully removed without breaking the skin. If ducks and geese, after scalding, are wrapped in a cloth for a couple of minutes, the down will then come off easily with the feathers. "Plumping," as it is called, is accomplished by dipping the fowl, after picking, in boiling-hot water for about two minutes, then placing it in cold water for ten or twelve minutes more. This gives a much brighter and fairer appearance to the flesh.

As to packing for shipment, boxes holding about 200 pounds are the best for turkeys and geese and, in fact, for all poultry, though smaller "game" may be shipped in barrels. In the bottom of the box or barrel put a layer of clean, dry straw, then alternate with poultry and straw until the package is so full that the cover will keep the contents from moving about, thus lessening the risk of bruising. Pack with the backs up, legs outstretched and the head bent under.

Now, a word concerning the marking of the package. "It's a terrible bother," said a commission merchant in our hearing the other day, "not to have packages properly marked and advised. We received a lot of pears recently without the consignor's name or address, and, some time afterwards, a postal card informed us that such a lot had been sent. But a good sale was lost." Every shipper, if he does much in that line, should have a brand or mark of his own, so as to establish a reputation for his goods, and this brand will be looked after by the consumer. Each package should bear the name of the consignor, number and variety of contents and the name of the consignee, and thus much annoyance may be averted. This is true of all shipments on commission—poultry included.

Miscellaneous.

CATALOGUES, ETC.

THE EARLY VICTOR GRAPE. We have received a descriptive circular and price-list of the new Kansas grape, "Early Victor," from Mr. John Burr, of Leavenworth, Kansas. Of this Mr. Geo. W. Campbell, the originator of the "Lady," and an excellent grape authority says:

"I regard the Early Victor, as far as tested, as the best and most promising early black grape that I have ever seen. I have grown it four years and fruited it twice. It has always made a good and perfectly healthy growth, with strong, thick, native foliage of the Labrusca type; in quality rich, pleasant and sprightly, with small seeds and very little pulp; fine flavored, without astringency or coarseness; it shows no tendency to fall from the cluster when over-ripe. It is very early in ripening, I believe earlier than the Hartford, or Moore's Early or any other black variety I have grown."

DESCRIPTIVE CATALOGUE of Fruit and Ornamental trees and plants cultivated at the Great Northern and Southern Garden and Nursery, Wilmington, Delaware, Randolph Peters, Proprietor. A catalogue of 65 pages with a colored plate of the Gibbs and Langford's Seedling Apple, and explicit details as to transplanting and culture. Free to applicants.

What Others Say.

THE POCKLINGTON GRAPE.—Green's Fruit Grower comments upon an article in the Gardeners' Monthly, which compares the Pocklington with other white grapes. The article as we find it in the Fruit Grower concludes as follows: The Pocklington is a seedling of the Concord, just as strong and vigorous a grower, fully as hardy to withstand the Winter's cold and Summer's fluctuations in temperature, or to resist mildew as its parent, the Concord. Last Fall I kept a bunch each of Lady Washington, Niagara and Pocklington till near the middle of December, on a plate in a close room. To my surprise, the Lady Washington, although the thinnest-skinned, was apparently the best keeper. I have no doubt, with a little care, either of these grapes may be kept to January 15th in good condition. To my taste the Lady Washington is entirely the best as to quality. The Pocklington is the next best, and while we are in doubt as to whether we can grow the Lady Washington successfully, it being a hybrid, I think there is no doubt whatever that the Pocklington will thrive and do well over a longer and wider extent of country than any other good grape, not excepting the Concord; for where the Concord will do well, I believe the Pocklington will do better because of its earliness. While I cannot agree with my friends who think the Pocklington grape better in quality than the best hot-house grapes, I do think it will prove the best and most valuable purely American Grape we may have for years. And on purely American and of the Labrusca species, I think we shall have to rely for our crops of market and wine grapes in most localities of this latitude east of the Rocky Mountains. I consider the Pocklington Grape, the *white* "grape for the million." We have had scores of white grapes introduced, tested, proved wanting, and discarded within the last thirty years, but the Pocklington has come to stay. It is of the largest size both in bunch and berry and the most successful white grape in taking premiums at fairs. It is seen above all others, it attracts more attention, and recommends itself—the grape-men cannot let it alone.

DAIRY PATENTS.—We find an article on "Dairy Patents and Royalties" in the enterprising Western Rural by our respected friend Mr. X. A. Willard. He says that the dairy business is now pretty well covered over with patent rights. Nearly every implement and appliance, besides some of the processes of manufacture, are loaded down with patents. A dairyman must now "look sharp" how he makes his cheese and butter, and uses his butter-milk, or he will be fastened with a royalty. Town people who enjoy a "bite of good cheese" have little idea of the manifold patents now employed in the production of this simple article of food. Let us enumerate some of them: The patent milking stool patent pail for milking: patented strainer for straining the milk; patented carrying cans; patented scales for weighing the milk: patented dumping cans: patented milk vats and patented heaters; patented agitators and patented coolers; patented rennet and coloring extracts; patented curd knives for cutting the curd; patented curd mills for grinding the curd; patented hoops and patented press, patented bandages and a patented appliance for putting them on the cheese. These are a part, and there are also innumerable patents surrounding the butter maker.

AMBER CANE IN MINNESOTA.—In a letter from Mr. Kenny of Morristown, Minn., to the Pioneer Press, he claims that Minnesota has the best climate in the United States for the production of sugar from the Amber Cane. The cane deteriorates very rapidly in warm weather after ripening or being topped and stripped. It soon begins to turn red, which means souring. But at a temperature of 60 deg. it will keep a great while, and it is easily secured from frost by being piled, but in the warmer South this treatment does not succeed. The cane, up to Sept. 15, should be ground immediately on being cut. The different cane mills vary in yield of juice. The vacuum-pan, by which the sirup can be boiled at nearly 100° below the ordinary boiling point, is much safer and better than the open pans in which the boiling must be done as rapidly as possible for best results, and the high heat burns up a portion of the sugar. There is better knowledge about clarifying, and the industry, Mr. Kenny says, is fast coming to the front.

A. W. PEARSON describes, in the Country Gentleman, an epidemic which has befallen the Wilson Blackberry in Cumberland County, New Jersey, and which threatens other sorts. It first appeared about six years ago, and is called "the double blossom," from its effect in multiplying blossoms when there should be but one, and producing small amorphic flowers in clusters, usually having no stamens and often no pistils, and therefore barren. Mr. Pearson says that he at first naturally supposed this to be a consequence of extra culture, the influence of which is generally supposed to be the primal cause of double flowering. But observations do not warrant this conclusion, as the affection is found to spread from points where it has first broken out, although not evenly, some plants remaining healthy and fruitful while all around are the reverse. It has invaded other cultivated varieties, and even, to some extent, the wild blackberry bushes of the woods.

SOLDER AND SICKNESS.—The Government of the United States, says the Inter-Ocean, might with good reason follow the example set by France, through a decree that has just gone into effect, ordering that all the cans which are to contain meats, fruit, etc., be soldered outside instead of inside, and that the cans themselves must be of plate made of or covered with pure tin instead of any of the alloys often used. The public frequently hears of families that have been poisoned by canned meats, tomatoes or fruit, but it never hears of the tens of thousands of people whose health is temporarily and painfully deranged by the same cause. Few persons realize how great the consumption of canned fruit is in the United States. All the year round these goods are used in the almost countless camps of miners, soldiers, hunters and excursionists, while in Winter they find their way into nearly every family in the land. The lead pipe scare, in connection with drinking water, has good enough reason, but in the can there not only is lead, but generally an acid to take it up far more rapidly than water could do.

FROM the Report of the Ingham Hort. Society, as reported in the Michigan Farmer, we take the following: Dr. Marshall gave his experience of several years in raising plums. He was satisfied that the only remedy for the curculio is to shake the pests on to a sheet. This is sure, and by adopting it he secures a full crop. He thought people failed in the matter by not doing the work thoroughly. It should be commenced before the trees are quite out of blossom.

"BARN-STORMING," says the N. Y. Herald, is the theatrical term for a country tour where the "combination" stops but one night in a place, and that a small place, and then moves on—if the landlord does not evince a fondness for trunks and other little articles for which landlords are strangely inclined to show an attachment at times. Time was—oh! golden happy days of rustic innocence—when our country cousins would greedily accept whatever came their way and ask for "more." But they have learned a thing or two, and now when a manager, with a worthless combination, a lot of three-sheet posters and samples of emasculated New York press criti-

cisms, reaches a moderately large town the wise ones quietly take him aside and advise him to "move on to some small village where they don't know much." So the manager goes "barn-storming" to the small towns. We do not hesitate to warn our country readers that it is best to inquire carefully into "attractions" arriving in their towns the coming Winter claiming patronage because of fictitious indorsements from New York.

THE good man bears with the faults of others very patiently; the bad man bears with his own in the same way. . . . . The man who plans a barn with modern improvements should be careful that his wife has modern improvements in her kitchen.—Iowa Homestead. . . . . If you wish to be happy you must learn to be just deaf enough not to hear some things and just blind enough not to see others. . . . . The difference between infidelity and true religion is this:—The infidel tries to make the world useful to himself, while the Christian tries to make himself useful to the world.

Everywhere.

SEARCHING FOR APIS DORSATA.

[WE have received the following communication from Mr. Frank Benton, the eminent apiculturist, who lately explored the primitive forests and tangled jungles of Java and Ceylon, in search for the famous *Apis dorsata*, which he intends to introduce into this country. He is doing a great work, and deserves the encouragement and gratitude of all who are interested in apiculture.—EDS.]

LARNACA, Island of Cyprus, Mediterranean Sea, Aug. 6, 1881.

After having passed some days in the beautiful city of Singapore (Further India) and the vicinity, a land of great palms and ever-verdant hills clothed to the summits with strange forms of vegetation, I sailed across the southern point of the China Sea, passing Britang, Lingen and a thousand other equally beautiful islands, into the Strait of Banca. We crossed the equator near the island of Lingen, but I was not fortunate enough to catch sight of that very ancient and respectable Great Circle.

Crossing the Java Sea, our good ship cast anchor before the harbor of Batavia, the great Handelsstadt of the Dutch East Indies and in size the second city of Malaysia. A portion of this city (the older part) looks much like some town in Holland—red tile roofs, a canal, etc., making the representation natural. The other part is quite East Indian, with its luxurious gardens. I traveled pretty well all over the wonderfully rich and beautiful island of Java, whose length is 600 miles, and whose population is over 22,000,000. I have some acquaintance with the Dutch language, but I found that most of the Dutch residents could speak English, French or German, so I got along very well with them in making myself understood. But my work took me into the forests and among the natives of remote villages, where there were no Europeans. No interpreters can be obtained, the European residents all having employment, and also all those natives who know anything of Dutch. Few of the natives learn the difficult Dutch language, but the Dutch all learn Malay. The Superintendent of Public Instruction for the Dutch East Indies detailed a Malay student who had learned some Dutch at the Government Agricultural School, to accompany me, but only for a few days, since his examinations were coming on. Thus with but a few weeks before me to spend in Java, I saw myself obliged to learn the Malay tongue, or enough of it to serve my purpose for the time being, so I sat down with a book and studied two or three days; then I went into the bazaars and out into the villages and talked all the while. In two weeks I could get along very well, for the Malay language is the easiest tongue I ever met with. It is called "the Italian of the East," and is, in fact, largely composed of soft vowel-sounds, and its pronunciation presents no difficulties.

By rail, coach and on foot I reached the very center of this mountain-land several times, made many excursions up the forest-covered mountains, and once reached the summit of an ever-active volcano, the Gedé, or "The Great" volcano, and gazed down into its awful, seething, steaming and thundering crater. The ground all about me was hot, and steam issued from every crevice. Acres of lava and scoria covered the plateau about the crater. Looking about I could count 50 huge mountain peaks, and far away on either hand were fertile plains stretching to the sea. Surely this was a glorious mountain land. I felt well repaid for my toilsome journey up the mountain—up, up, all night long, through the tangled, dripping vegetation of a luxurint tropical forest, through the water and over the rocks of the steep mountain path. An hour or two after sunrise this great volcano shrouds itself in clouds and only comes forth in its majesty when another day breaks. The descent took us until late in the day. I cannot stop to enumerate the twentieth part of the wonderful forms of vegetable life that met my gaze. Giant tree-ferns, sometimes reaching a hight of fifty feet, and beautiful begonias were numerous, while honeysuckles, violets, St. John's-wort, and the Royal Cowslip were strewn along the way. The beautiful flower last mentioned is said to be found nowhere else in the world.

In Ceylon I passed a month on my way home, and met with many adventures while securing the Great East Indian bees in the jungles of that island, second only to Java in richness. I brought with me some colonies of the far-famed bees, Apis dorsata, but a severe attack of East Indian jungle fever, which I had just before leaving India, and which accompanied me much of the way on my return journey, obliged me to neglect these bees, and many of them died after my arrival in Beyrout, Syria.

My work in this search for the Apis dorsata in a distant land is the first of the kind that has been attempted, and I am very grateful for the words of encouragement from eminent American and European bee-culturists.

FRANK BENTON.

RURAL SPECIAL REPORTS.

Arkansas.

BEEBE, White Co., Sept. 25.—We have had two fine rains in September, and it is cooler. They came too late for cotton, but they started the grass which the stock is rejoicing over. Some have picked corn so as to get the good of the grass. Cotton is going to be short. A neighbor has 32 acres and will make four bales. I have 26 acres and will make five bales. My rust-proof oats were the best and heaviest. The Brown Oats were not so good. New Zealand Oats were very good. The Washington Oats I did not get in time to give them a fair trial; the others were up about three inches when I sowed the Washington. The Hulless Barley did very well. White Russian Spring Wheat and Champlain both mildewed. I planted three rows of corn and fertilized one with chicken manure and two rows with sheep manure and some with unleached ashes. I dropped a handful to a hill and could soon tell the difference in the rows. The chicken manure was best, ashes next. The rows were all in the same field. My Blount's Corn did very well and I am pleased with it. In a good season it will yield well here. It is a good fodder plant also. My Elephant Potato came up well, but while in blossom the drought came and just cooked the potato tops, and some navy beans right along side were totally burned up, while the Branching Sorghum stood still but was green all the time. My Egyptian Corn was planted very late and I could not work it at all. It kept green all the dry time and I shall get quite a little amount of it. I think this dry season has injured the fruit to some extent. The buds are just beginning to swell and the strawberries are more than half killed. I had 4,000 bearing plants and a neighbor had an acre and a half, but he will not have 1,000 living plants this Fall, and many of mine have also perished. Now if J. A. J., of Grand Prairie, who lately wrote to the RURAL in contradiction of my statements, still doubts my words, if he will come to my house I will keep him and I will prove their truth to him and it shall not cost him anything while he stays. The people at Beebe Station told me a year ago if I stayed three years I could not get away unless I had friends to help me, and I believe that if I do not get away this Winter I will have to stay. I cannot say anything more about the country than I have said. J. A. J. said there were four rivers in the State, but everybody cannot live where the rivers are. Cotton is 11c. per lb.; flour, $9@9.50 per bbl.: cornmeal, shipped from the North, $1.25 per bushel of 40 lbs.; meal, made here, $1 per bushel of 50 lbs., not bolted; potatoes, Irish, 4c. per lb.; pork, shipped here, 15c. per lb.; corn, $1 per bushel. Farmers are in a dilemma on the bread question; if they feed their corn to make meat they say they will have to do without bread, and if they keep the corn they will have to do without meat. H. B.

HOT SPRINGS, Garland Co., Sept. 23.—This has been a fearfully dry Summer, a few nubbins of corn, a few bolls of cotton; no vegetables; and the only full harvest we gather is that from our hot water; but for that we'd be "gone up." Of the RURAL seeds I sowed my dianthus in full hope of enjoying their surpassing beauty, but alas for my hopes! the elements have conspired to blast them. The White Elephant produced tubers about the size of the seed. I planted for a second crop, watered thoroughly and rested in hope of rain, but it has not come. I have a half peck of very poor Washington Oats. The Branching Sorghum and asparagus have done no better, nor could they. With perfect propriety we may adopt for this section the description given by a Beebe, Arkansas, correspondent some time ago, so far as farming is concerned. But our thermal waters can beat the world in miracles and our mines will yet show up. T. J. B.

Connecticut.

WOODMONT, New Haven Co., Sept. 24.—From the seeds of the Washington Oats I obtained seven pounds; should have had more, but cows got into the field and destroyed over one-half. From the seed of White Elephant sent me I dug 70½ pounds of potatoes, very few of which were too small for market. I inclose specimens of two of the largest, though they run very uniform in size. G. A.

[The two referred to weigh one pound two ounces each.—EDS.]

Illinois.

DOVER, Bureau Co., Sept. 21.—The season here is dry and warm so far. Wheat light; oats a fair crop; corn two-thirds of a crop; grass light. My Rural Branching Sorghum came up well and branches wonderfully, but I am afraid it will not ripen here; it is just beginning to head out. The Washington Oats were drilled and I have one-half bushel by measure, but rather light; they rusted badly. The White Elephant Potatoes were nice, considering the dry weather. I had 24¾ pounds of smooth potatoes, besides some small ones I did not weigh. I am well pleased with them. My asparagus grew finely, both French and Dutch, and I will have enough to plant quite a good plot of it in the Spring. The flower seeds I gave to one of my neighbors. The Surprise Muskmelons, from seed received last year, were all destroyed but one, but I saved the seed and planted it this year and have a nice crop of fine melons, rich and good. The Beauty of Hebron Potatoes are the best I have. They ripen with the Early Rose, but the yield is one-fourth greater. Both were planted the same day, side by side, and the cultivation was the same. Only one Cuthbert Raspberry grew and that did not show any fruit this year; but there are a number of suckers from the roots, so I shall have plenty in a year or two; but I think they will not suit our prairie soil. I have tried several kinds of red raspberries here, but have not succeeded very well, though the Black-caps do well. I mean to give them a fair trial and if they do not suit me I will dig and burn them. J. B.

Iowa.

LYNN, Dallas Co.—My asparagus has done finely and the R. B. Sorghum also; but the hail and bugs took the W. E. Potato, and the hail and rust ruined the oats. S. W.

Maine.

EAST MACHIAS, Washington Co., Sept. 23.—The White Elephant Potato sent to me last Spring weighed six ounces. It was planted May 10. On Sept. 18, I dug from it 17 pounds. Some were very large and quite a number of small size. The season for potatoes has been very poor and the crop light. One of the W. E. Potatoes was boiled, and as Eastern Maine is the *habitat* of the potato, and the locality where it reaches perfection, it was found to be of most excellent flavor and as fine as flour. J. C. T.

LEWISTON, Androscoggin Co., Sept. 24.—Some six or eight weeks ago I wrote to you to know at what time and in what manner to plant out the tips of Black-caps, not the time to layer them. I have not had very good success in the planting of them. In 1880 I planted 50 Greggs and 22 lived. In 1881 I planted out 175 plants and five or six only lived out of that set. I did not do the work myself; I had to leave it for the hired men to do, as I had to be absent from the farm. I want to know if I should buy plants six months old, and if tips transplanted last Spring would not be better and surer to live than tips planted in the Spring. [We do not exactly understand the question.—EDS.] I have the Clark, Herstine, Turner, Cuthbert and Pride of the Hudson. The Hudson was the best of them all. It is one year old and has borne a crop of large, nice-flavored berries. The next is Cuthbert, large and good. There was very little difference in the hardiness of the different varieties on my grounds. Clark is a very nice, large berry and hardy, but it suffered most from the climate. Of grapes, Adirondac is as good as any with me, but a very slow grower, and mildews some; but, on the whole, it is the best I have. The Rogers's No. 3 is next. Eumelan stands third. I am inclined to think that the Whitehall would be a good grape, as I understand it is the same, or about the same, as Adirondac. The Concord is called early in your State, but it is late with us. It ripens about one year in five here. Delaware is good and ripens a little earlier with me than the Concord. I want some very early grapes that are good. The Moore's Early has proved a very slow grower with me; how is it with you? [A rapid and vigorous grower.—EDS.] I had thought of four Moore's Early, three Whitehall, three Telegraph, one Eumelan, one Prentiss, the last one trained on the south side of the house under the piazza, so that when the piazza is glassed in I can keep them warm from the sitting-room stove, and yet expose the vine to the full rays of the sun all day. I would like to know more of the Niagara, Duchess, Prentiss and Lady Washington, and which is best for me to plant, the Lady Washington or the Prentiss or Pocklington. [All are good. You can only ascertain which would be "best" in your soil and climate by making the trial.—EDS.] C. A. H.

Michigan.

PLATTE, Benzie Co., Sept. 21.—I would like to let you know how we are doing in the woods of Michigan. Hay is very good; wheat middling; rye and oats very fair; early-planted potatoes good, and corn yields about 10 bushels per acre. We have plenty of strawberries, and all the other small fruits grow wild here. We raise a good many grapes and make wine from them. I have a seedling which ripens its fruit two weeks earlier than the Hartford Prolific. This grape is excellent for the table and for wine, and the vine is a very rampant grower. No one here knows its right name. I like to read your paper very much, and I always find something to learn from it. A. G.

SHERMAN, Wexford Co., Sept. 24.—The season here has been, taking all things into consideration, very favorable for the farmers. This is a new county; it is only 18 years since the first settler moved into it. The soil is mostly of a sandy loam heavily timbered with elm, maple, beech, basswood and some hemlock, except along the Manistee River and its tributaries where there are pine, cedar and hemlock. It is well watered with clear pure water; all the streams are cold and clear, the water running over gravelly beds. This season opened up later than usual with us. Winter wheat was killed out somewhat by smothering. We had too much snow and the wheat was thin on the ground, but of most excellent quality. The yield is from eight to thirty-two bushels per acre as far as heard from. There has been no thrashing in this neighborhood yet. I think the average per acre of wheat will be about 12 bushels in this township. Oats about 30 bushels. Corn is about two-thirds of a crop. The weather was a little too dry and scorching in the latter part of July and first of August. Potatoes will be about an average crop. Not much fruit; very few orchards have yet come into bearing and this is an "off" year for apples. From the Rural Branching Sorghum I succeeded in getting only a few hills and the stalks have made but a slender growth, being only about three feet high. The White Elephant I received weighed two ounces. I cut it into nine pieces and planted one piece in a hill. I have dug them and they weigh 14 pounds of fair-sized tubers. My Washington Oats were all eaten up by grasshoppers. The flower seeds were an entire failure. There is a larger acreage of wheat sown this Fall than ever before here, and most of it is up and looking first-rate. Wheat is $1@1.10 per bush.; oats, 40@45c.; potatoes, 50@60c.; hay, $18@22 per ton; cows, $25@45 each; work oxen from $110@175 per yoke; sheep, $4@5 per head; calves, $5@10 per head; hogs, 5c. per lb., live weight; pork, fresh, 12c. per lb.; beef, 8@12c. per lb. for fresh. I. N. C.

UNION CITY, Branch Co., Sept. 29.—I wish much to thank you for the seeds sent us in the last seed distribution. We have a goodly number of asparagus plants and some beautiful pinks (wish you could see them). Planted only a few hills of Sorghum but am well pleased with it. Cut one hill down as you suggested and am convinced it is one of the best fodder plants—better than corn on account of second growth and standing the dry weather splendidly. The oats were good and so were the Elephant potatoes. I had fifteen hills (one eye to a hill) and had 37 pounds of tubers. The Pentstemons you sent in 1879 have failed to blossom as yet, though I watched them carefully. L. B. T.

Minnesota.

NEW YORK MILLS, Otter Tail Co., Sept. 19.—I have dug the White Elephant Potatoes and find they weigh 85 pounds, from 13 eyes planted one eye in a hill. One potato weighed a pound and three-quarters. My asparagus looks splendid. The sorghum did not amount to much. Washington Oats yielded well. I saved one peck; birds destroyed some. A. P.

WINNEBAGO, Faribault Co., Sept. 20.—The present season has been one of the wettest ever known hereabouts. All small grains are scarcely paying for the labor of harvesting them. The corn crop, however, is promising a fair return, but owing to the backward Spring not more than a quarter of the usual number of acres was planted. Hay, or, rather, the grass crop, is excellent; hundreds of tons, however, are rotting on the ground for lack of fine weather to cure it. The Blue Earth River, which flows from north to south through this county, never was known to be as high at this season of the year. Now it is causing back-water to many of the grist mills on its banks. Not much thrashing done yet.

Wheat on the best fields yields ten bushels per acre; on poor fields from three to four bushels, and that of very poor quality. A larger area of flax was sown than in previous years. Its appearance is very poor, as it is mixed with weeds and grass, resembling a marsh more than a cultivated field. We have hundreds of acres of unplowed land lying worse than waste, being a complete nursery of weed seeds, heavy rains preventing farmers from summer-fallowing. And yet I wish to state right here that we are not discouraged, believing this wet season is just what the country needed. Our wells were very low and and many of them dry last Summer, and a fresh supply of water was needed at the fountain-head. The potato crop was never better with me. I dug over a half bushel of good-sized ones from 13 eyes planted of the White Elephant. The Washington Oats stood the season splendidly—I never saw better oats. The flower seeds, which still keep in bloom, gave a fine display, too. In fact, all the seeds received from the RURAL grew finely. The Cuthbert Raspberry proves equal to our climate and bore excellently this season. My White Elephant Potatoes measured seven and a-half inches in length many of them. H. F. S.

Missouri.

PLEASANT MOUNT, Miller Co., Sept. 24.—We have had two or three good rains in the last ten days, which though doing crops no good, have helped to start pastures and enabled farmers to plow for wheat. There will not be as large an acreage sown this Fall as last. A great number of farmers are afraid of chinch bugs another year. Stock hogs, cattle and sheep are selling at very low prices, while fat stock bring good figures. The failuro of corn and the high prices of all kinds of feed are the causes. Such a general failure of all kinds of crops has not been seen for many a year. N. J. S.

New York.

GALWAY, Saratoga Co., Sept. 22.—The RURAL pinks are lovely, but I lost some of them before I learned that they could not bear strong sunlight. The asparagus seeds came up well; I have 63 plants. The oats were sown in a drill and grew from five to six feet in hight. We saved three pounds and nine ounces of fine oats. The White Elephant I got was small; weight about two ounces, I should think. It had 12 eyes. I raised 32½ pounds of fine tubers from it, the largest weighing 17 ounces. The Rural Branching Sorghum came up well. I sowed it at three different times, but the earliest sowing did far the best here. Cattle and hogs are very fond of it, and we think it cannot fail to prove a valuable forage plant. The second growth is over two feet high. I should like to test a few plants of Pyrethrum, or Persian Insect Powder, if you think it would grow as far north as we are. [We have no seeds on hand.—EDS.] I wish you every success in your noble efforts. G. M. C.

OGDENSBURG, St. Lawrence Co., Sept. 23.—We had a very severe thunder storm here last night and this morning, accompanied by a heavy rainfall. This rain makes it safe to sow Winter wheat. Stock had also commenced to suffer for want of water. F. K. M.

STERLING STATION, Cayuga Co., Sept. 22.—While nearly every species of vegetation on our premises is turning brown and desolate-looking from the fearful drought, our little patch of Rural Branching Sorghum gives the eye something cheerful to look upon. In spite of the lack of moisture, which has destroyed every vestige of green color near it, it still keeps up a sturdy and vigorous growth. Corn about here is scarcely half a crop; potatoes the same. Apples, prematurely ripe, are dropping from the trees, a slight wind bringing them down in showers. Peaches and pears are an abundant crop. Farmers mostly are waiting for rain before sowing their wheat; some have sown, and the seed either lies dormant or has rotted. I have heard of but one successful seeding. Upon our own farm a summer-fallow of 12 acres was sown the last of August. It has made a splendid growth; so far the drought does not seem to have affected it in the least. The land has been thoroughly tilled at various times throughout the Summer. Our forest fires are still raging fearfully, and if rain does not soon come the best timber land in this vicinity will lie in ashes. Miles of fences have been burnt and a few farm buildings. In some places the buildings have been saved only by constant vigilance. Ordinary farm work remains undone while whole neighborhoods work night and day fighting fire. Wheat is worth $1.45; potatoes, 75c., and advancing; onions, 75c., and a large crop; eggs, 18@20c.; butter, 30c., and very scarce; Fall apples, $1.25 per bbl.; windfalls, do., 25c. per bush.; pears, 75c@$1; peaches, $1.50 per bush. E. K. B.

Pennsylvania.

UNION CITY, Erie Co., Sept. 20.—Wheat is yielding about 10 bushels per acre—a middling fair yield. Oats a full crop. Corn nearly a failure—won't average more than five bushels on account of drought. Hay was never better. Potatoes are not more than one-third of a crop. My W. Elephant did remarkably well. It was cut into eight pieces each of which was planted separately a foot apart. They received good care and have yielded just an even half bushel of tubers as handsome as any I ever saw. I wouldn't take $5 for them. The W. Oats grew well till they headed out; then the rust struck them and they broke down. The pinks are very handsome. J. D.

Virginia.

MOUNT JACKSON, Shenandoah Co., Sept. 20.—The extreme drought has burnt up nearly everything in this country. I am happy to say that the White Elephant Potato did well—much better than any other variety I planted. The potato I received from the RURAL weighed three and a-quarter ounces, and I dug one peck of nice tubers. Yet I feel a delicacy in reporting this yield when I see the report of the California man who got 130 pounds. L. T.

WILLIAMSBURG, James City Co., Sept. 22.—The drought beginning here about August 1 and continuing to September 8, has seriously shortened the crops. Corn will not be more than half a crop and potatoes will be still worse. The peanut crop will not be more than half. The Rural Branching Sorghum I consider valuable for a green fodder crop. I planted it about May 5; it gave five to eight stalks from a seed. I cut it about four weeks since, six inches above the ground, when it was seven feet high. It then branched out again four and five stalks from each of the old ones, and is now about three feet high. I left some stalks for seed; they are now 11 feet high, the seed eight inches out at the top—perhaps too late to ripen. I could have planted safely a month earlier, which I think would have ripened the seed. From the White Elephant Potato I got 19 hills, giving 18 pounds. I planted another potato alongside of them, which, with the same treatment, yielded twice as much. W. P.

West Virginia.

NEW CUMBERLAND, Hancock Co., Sept. 27.—I planted the White Elephant Potato about the first of May. It weighed four ounces and had 17 eyes. I cut it into 17 parts and planted one to a hill in a moderately rich soil without any manure of any kind. I gave it the same cultivation that I gave Early Rose and Burbank's Seedling. The weather was very wet in the fore part of the season and very dry in the latter part. I dug them September 6, and there were 120 White Elephants, weighing 25 pounds, the largest one weighing 17 ounces. The Burbank's Seedling did not produce one-half what the White Elephant did, though they were planted side by side. The Washington Oats I consider a failure. But few seeds of the sorghum germinated; I have about 20 stalks; the dry weather has injured it very much; still I think it will prove a valuable fodder plant. L. S. B.

Washington Territory.

SPANGLE, Spokane Co., Sept. 20.—We received all of our seeds except the potato. They did not do very well this season. It is too cold here for the sorghum. The oats nearly all went to smut. M. B. L.

WAITSBURG, Walla Walla Co., Sept. 17.—We have not had a very warm Summer. August has been particularly cool; one could readily have mistaken the month for September. We have had an occasional shower, which kept the temperature even. Harvesting nearly over. Our Spring wheat only yielded 23 bushels to the acre. Fall-sown would have gone 28 or 30 bushels on the same ground. I have just sold 4,000 bushels for 60 cents per bushel, delivered at our new depot one mile from here. Our soil is just an average one. Near the foot-hills of the Blue Mountains the yield goes from 35 to 60 bushels, for the soil is more moist; but ours is good enough. We can raise all cereals and our vegetables are equal to those grown anywhere. We have about 50 plants of the best sort of tobacco, which are now becoming mottled and nearly ripe. Our potatoes are ripe, but undug, so I cannot give the yield, but it is good, for we often get more than a peck from one hill. We have several varieties, such as the Snowflake, Beauty of Hebron, Peerless, Goodrich, Improved Peachblow and others. I never hear of any complaints of potato rot or bugs or any other pests. Apples and plums are plentiful and bring one cent per pound; peaches in abundance and worth five cents per pound. M. A. R.

The Queries.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

"WOLF TEETH" IN HORSES, ETC.

S. H., Lowell, Mich., asks, 1, what are "wolf teeth" in horses, and what harm do they do; 2, he has a three-year-old horse to which a child lately gave too much corn, so that he became badly "foundered," but has since recovered, and our friend says he learnt of the mischief within an hour after the corn had been eaten; but he did not know what to do, and he inquires what treatment should have been adopted—should he have given the animal water to drink, and if not, why not.

ANS.—"Wolf teeth" in horses are two small supernumerary teeth which make their appearance on each side immediately in front of the first molar or double teeth on the upper jaw. The germs of these teeth will be found in the jaw of the developed foal, and they are fully formed in the yearling, ready to work their way through the gums, after which, as a general rule, they soon fall out. Sometimes, however, they remain till an advanced period of life, during which time they undergo a change in form, and become more closely like the incisor teeth in man. Among horsemen and especially among farmers there is a very strong impression that these teeth are injurious to the eyes, frequently causing blindness unless they are removed in time. Veterinarians, however, say that such a result is contrary to veterinary experience, and that if the belief were correct all horses would go blind, as all horses have these supernumerary teeth at some period of their lives, generally from the first to the fifth year. So strong and widespread is the belief in the blinding effect of these teeth that whenever a horse has an attack of specific opthalmia, these teeth are pretty certain to be looked for, and if found, they are supposed to be the cause of the disease and are at once knocked out by means of punch and hammer, or in some other equally cruel way. This process bruises the gums, causing considerable local inflammation in the parts, which, acting as a counter-irritant, attracts the inflammation from the eye, just as a blister might have done if applied at some other place, and straightway the belief grows stronger that the "wolf teeth" were the cause of the eye trouble. If one will insist on removing these teeth, he should get a common pair of dentist's forceps and pull them out. 2. The colt should not have water till it had dunged freely, as it would have the effect of swelling the corn in the stomach, and hindering digestion. Walking him gently a short distance every half hour or hour during the day, might be beneficial. After his intestines were pretty well cleared by dunging, he might have a small feed of grass or hay, with a quart or two of bran according to his size and age, to which a gill of oil meal should be added, if any were on hand. If not, the same quantity of jelly made of boiled flaxseed should have been given. This feed, with tepid water to drink two or three times per day, might have been continued till the corn was digested and discharged, and then the colt could be safely turned out to his usual feed. In such a case if physic is necessary to purge the colt, one of the safest and most effectual remedies is aloes. Try to get the pure Barbadoes, but as this drug is so often badly adulterated it is almost impossible to get it pure at ordinary druggists'. If pure, two or three drachms would be enough for a dose; if not pure, it would require more. Consult a druggist as to this, and the best way to administer it. One of the best and most simple things for foot founder if in the Summer, is to turn a horse out to a smooth grass pasture free from stones and let him remain there till well; if in Winter keep him in a dry, sandy yard or on a dry earth stable floor.

TREATMENT OF A FRACTIOUS HORSE.

S. B., Cardington, O., wishes to know the best method of breaking a horse of kicking. He has a beautiful dappled grey, seven years old, that has been worked from a colt, and always seemed gentle and kind until within a few weeks; it is now unwilling to be harnessed or even patted. Can assign no cause for it; would like to know if there is a humane treatment for such a habit.

ANS.—Some person or some animal, unknown to the owner of the horse, has undoubtedly been plaguing or injuring him in such a way as to make him afraid to let any one touch him lest he should be again hurt. Or the animal has met with some accident which has given him great pain, and he fears to be touched by any one lest this be increased. The only way to overcome this is to treat the horse with perfect gentleness, speak low and kindly, and, above all, never strike or threaten him. If when approached he is fed with a lump of sugar from a dish, or anything he particularly likes, he may permit the giver to gently pat and rub his head, then his neck, and finally his body; but in doing the latter, be careful to keep in such a position by his side that if he kicks he cannot hit you. If not vicious to other horses, it might be well to turn him out to pasture with them and the association would cure him of the trick. If this cannot be done, then let him run with young cattle that have not horns long and sharp enough to gore him. Or, if perfectly sound and well, hard, steady work with moderate feed might cure him, especially if he previously had been fed high and kept idle, for these sometimes make a horse vicious, or so playful and high-spirited that it amounts to the same thing.

PACKING FOR AN ICE-HOUSE.

H. F. B., Clinton, Mo., last year packed his ice-house with flax straw because he could not get sawdust, and in May the ice began to melt at the bottom and he lost a great deal of it on account of the flax-straw packing, he thinks. He now asks whether ice will keep well if packed with sawdust all round it, the ice to be on boards two feet from the ground with a layer of sawdust to protect it from the air.

ANS.—The trouble in this case was not so much the packing as the probable access of air to the bottom of the mass of ice. One cannot keep ice and get cold air and drippings from it. It might as well be expected to keep money in a bank when a little is drawn out every day. The drippings and cold air are merely drafts upon the stock of ice. Flax straw would make a good packing if it were cut up into chaff. The bottom of an ice-house cannot be made tight if there is a space under it. Air would pass through the seams of the floor with the greatest facility. The best bottom is the earth dug out about four feet, but it should be such as would let the moisture from the ice pass off easily. Perfect drainage for water, and yet an air-tight bottom are required to keep ice. A foot of packing should be put under the ice. The arrangement of the walls mentioned would be judicious. Sawdust is the best packing, but there are several others nearly as good, as tanbark, charcoal-dust and chaff.

Miscellaneous.

J. A. H., Kearneysville, W. Va., sends beetles for name, etc.

ANS.—They belong to the Cetoniadæ, or Cetonian family of beetles, and are known scientifically as Osmoderma scaber, or the rough Osmoderma. French naturalists gave them this name, which means scented-skin, suggested by their strong odor. Prof. Riley writes us: "Judging from the habits of the European Osmoderma eremita, and from observations made in this country on O. eremicola, it is safe to say that the species of this genus are not injurious, the larvæ living on rotton wood of deciduous trees and the beetles also feeding on decaying wood. Some Cetonians are, however, known to be injurious, *e. g.*, our common Allorhina nitida, the larva of which feeds on the roots of grasses, and Euphoria inda, which, as a perfect insect, injures peaches, apples, cotton bolls, corn, etc."

H. H. H., Iowa, asks, 1, the name of the best work on gardening, especially vegetable gardening: 2, the best on poultry: 3, the best and quickest-growing shade trees to plant along the street in front of a residence.

ANS.—1. Peter Henderson's Gardening for Profit is the best work we know of. 2. Lewis's Practical Poultry Book, $1.50, and Wright's Practical Poultry Keeper, $2, are both good. Wright's Illustrated Poultry Book, $17.50, is better still, however. These, as well as Henderson's work, can be had through the American News Co., New York. 3. The Silver-leaf Maple is a rapid grower. The Norway, Red and Sugar Maples are handsome, but of less rapid growth. The catalpa, if properly treated while young, is both rapid-growing and ornamental.

C. E. De G., Egan, D. T., having subscribed late last Spring, asks "whether he will have to subscribe again before his name is enrolled for the F. S. Distribution; 2, can the three kinds of wheat included in it be all sown in Spring, for Spring wheat is the only sort raised there: 3, where can he get a specimen of the Black-bearded Centennial Wheat.

ANS.—1. No. Any application made by any person whose name is on our subscription list is valid. 2. Yes, as well in the Spring as in the Fall, though they may not thrive as Spring wheats. 3. Some of the Chicago seedsmen should have it.

W. M., Camden, Ohio, asks whether the wheat for the RURAL'S next Free Distribution will be sent out this Fall.

ANS.—No. It would have been impossible for us to have got it ready for this season's sowing.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, OCT. 1, 1881.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 PARK ROW, NEW YORK.

SATURDAY, OCT. 8, 1881.

THIS has been in drought-visited regions a bad year for budding. There has not been enough sap to form a cambium layer so that the bark would not peel from the wood.

CONSIDERING the drought which has prevailed at the Rural Farm—the severest within our remembrance—it was very gratifying to have received the first premium at the Queens County Agricultural Fair for the Rural Heavy Dent Corn.

OUR first-page portrait of the distinguished agricultural chemist, Dr. J. H. Gilbert, the associate of Dr. Lawes, of Rothamsted, England, is from a photograph furnished at the solicitation of the RURAL NEW-YORKER.

IT IS surely worthy of note that while a plot of corn within 50 feet of the Rural Branching Sorghum has been destroyed by the drought, the latter is now (Sept. 28) as green as when it was but six inches high, and it is still growing rapidly. Our "Everywhere" columns have furnished many similar reports. During seasons of drought, we deem this Sorghum invaluable.

IT IS no easy matter for us to improve the RURAL unless we know in what respects our readers desire a change. It will soon be time for the great majority of our subscribers to renew. Would they kindly make their preferences known? Let them freely state what departments they prize most—what least. We should then have a guide as to our future course, which we should follow without misgiving that we were marching away from instead of towards our readers.

WHY shouldn't the Southern States that are anxious to obtain immigrants follow the example of Texas or Missouri? The former State has energetic agents in Europe whose business it is to explain by lectures, pamphlets, and other means, the great advantages and resources of the Lone Star State, and consequently the immigration to it from Europe is far greater than that to any other Southern State—greater, indeed, than to all the other Gulf States. The Missouri Immigration Society has recently sent to Germany 40,000 additional copies of its hand-book descriptive of the resources of that State, making a total of 100,000 distributed by its agents in Prussia alone. Like Texas, it has sub-agencies in nearly all the principal cities of Europe, and offers to emigrants very flattering inducements to settle in that State. Accordingly a large number of new-comers have lately gone thither. Few are the earthly blessings that come spontaneously to those sitting supinely with folded hands.

A SPECIMEN RAILROAD EXACTION.—We have in this city on a small scale an excellent specimen of one of the methods by which the railroad corporations fleece the public. The two railroad companies that in the last few years have constructed elevated railroads through our streets, leased them some time back to a bogus corporation under the name of the Manhattan Company, whereupon the stock was "watered" to the amount of some thirteen million dollars. The Manhattan being unable to fulfill its contract with the original companies, a Receiver was appointed about nine weeks ago, and now the President of the Company and the Receiver declare the roads cannot be made to pay expenses at the present rates of fare. It is therefore proposed to raise the rates, thus taxing the people of this city to pay interest on some thirteen million dollars of mere paper capital. In other words, New Yorkers are asked to overlook, first, the confiscation of private property or the injury to it rendered necessary by the construction of the roads; second, the extravagant cost of the roads and running stock, owing to the manipulation of a "construction company" and other gambling devices; and third, the enormous addition of "water" to the already shamefully inflated stock.

SUFFERING MICHIGAN.

RIGHT in the track of dire desolation by fire comes wasting disease to the afflicted inhabitants of the burnt districts. Pneumonia, malarial fever, and other diseases induced by long exposure are adding death to destruction. It could hardly have been otherwise! How can women and children, aye, even robust men, long endure such extremes of suffering and exposure as those poor people have been obliged to submit to! Homeless, they have been driven to seek shelter in huts of brush; hungry, they have been forced to eat the charred remains of burnt corn and wheat, or the imperfectly cooked flesh of their domestic animals; heart-broken, they have poor consolation in viewing their ruined homes and desolated fields! It is no wonder that disease finds them easy victims, and that death seems a happy relief.

The Secretary of the Michigan Relief Committee in this city has been traveling through the burnt district, and he reports that the extent of the calamity has not been exaggerated, and that the total loss may be put down at $7,500,000. It is asserted that fully 20,000 persons are now suffering there, and that no less than $2,500,000 will be required to place them in a self-sustaining condition. Up to the present time $260,000 have been subscribed for their relief, of which New York has contributed over $85,000. Besides this, clothing is being forwarded from many of the larger cities and towns. It seems as if the hand of Fate was against these people; snow, floods, droughts, fire, disease, have followed each other in quick succession, and it now remains for the more favored portions of the country to alleviate the hardships of the Michigan people by generous gifts.

How many of our farmer readers have yet forwarded the proceeds of that "Michigan bushel" of wheat?

AUSTRALIAN MEAT FOR ENGLAND.

As previously mentioned by us, several cargoes of meat have within the past year been brought from Australia in fine condition to England, where they met with a ready sale. The French steamer Frigorifique, specially constructed for the purpose, also transported a cargo or two of mutton and beef from South America to France without deterioration, the meat being preserved by means of artificially dried and cooled air, the power for making the ice for cooling purposes being furnished by the vessel's engines. The South American meat trade, however, has not grown, probably because the South American meat is poor, stringy stuff at the best; and the Australian meat trade has been suspended owing to the impossibility of carrying on a paying trade by means of steamers, because such vessels can spare no power for refrigerators and can carry barely enough coals to take them to the end of their long voyage. The experiment with the Frigorifique proved that with a sufficiency of dried, cold air, the time the voyage consumed was of no consequence, and it has therefore been determined to attempt to carry dead meat from Australia to Great Britain by sailing vessels. An engine of 100 horse power will work the refrigerating machine. To supply such an engine with coal will be vastly easier than to keep up steam for the four or five thousand horse power engines of a large ocean steamer. The sailing vessel selected for an experimental voyage is the Dunedin, of the Albion line, which left Glasgow a few weeks ago and is expected back in May, 1882, with the first cargo of Australian mutton and beef transported by sail. If she is successful, she will be the pioneer of a trade whose vast extent may be estimated from the fact that the Australasian English colonies have 60,000,000 sheep—almost as many as the United States and the United Kingdom together.

THE BOOM IN CEREALS.

DURING the past week there has been intense excitement in the cereal markets at all the chief centers, but especially at Chicago. There a "boom" in wheat set in last Tuesday, and during the day prices advanced no less than seven cents per bushel. The prices of all descriptions of produce rose in sympathy and the "bulls" had things all their own way. Wheat for October delivery opened fairly firm at $1.34, and by noon had risen to $1.36, from which point it advanced steadily without a break to $1.41 per bushel, the highest point of the day, and the highest for several years. In this city prices, rising steadily, had advanced by Thursday evening 20 to 23 cents per barrel for flour; and four to five cents per bushel for Spring and Winter wheat for prompt delivery. Corn advanced from one to two-and-a-quarter cents per bushel; oats one-and-a-quarter cent to one-and-a-half cent; rye one to two cents; and barley three to five cents per bushel. Prices for future delivery rose correspondingly. On Thursday very heavy trading was done in this line, the reported sales having amounted to 2,860,000 bushels of wheat; 2,208,000 bushels of corn and 690,000 bushels of oats. The favorite grades were: of wheat, No. 2 red; of corn, No. 2; and of oats, No. 2. November options attracted most interest, but December options are rapidly gaining in favor. In spite of low ocean freights the high prices here greatly checked exportation, as our transatlantic customers were unwilling to pay our figures. On Friday and Saturday, however, heavy European orders are reported to have been received in this city, Philadelphia and Baltimore, so that it seems likely that both in England and on the Continent the conviction is growing that the supply of breadstuffs this year is certain to be below the demand. The latest French estimate of the deficiency in wheat—that of the Paris Bulletin des Halles of September 4—puts it in at 9,000,000 hectolitres, equal to about 25,000,000 bushels. Other trustworthy accounts, however, make the deficiency much higher.

THE SUGAR BEET INDUSTRY.

WITH regard to the sugar beet industry in this country, we learn that a French gentleman, named Meyer, intends to start a sugar beet factory in one of the northern counties of this State, with a capital of $200,000. The machinery is to be made in this country, and the outfit will cost $59,000. It is expected that the beet crop will average 25 tons to the acre, cost the manufacturer $5 per ton, and yield a profit of $27 per acre, and a product of five to six per cent. of sugar. The Mohawk Valley Beet Sugar Company, that was to begin operations this Fall near Schenectady, N. Y., has been forced to delay a year, because its offered price for the machinery of the Franklin, Mass., factory having been refused, it was too late to order other machinery from Europe so as to have it in operation before next Fall. The contracts made for beets with neighboring farmers were canceled. The Delaware Beet Sugar Company, of Wilmington, Del., takes a great deal of the beets raised for the Mohawk Valley Company, paying for them at the rate of $4 per ton. The entire factory and machinery of the above Franklin Beet Sugar Company is to be sold at auction for what it will bring. Lack of ample capital is assigned for its repeated collapses. The Delaware Beet Sugar Company has made arrangements for enlarging its factory with a view to working up 150 to 200 tons in 24 hours, and has already obtained the requisite filter, presses and battery. Mr. Kerbs, the Superintendent, feels more confident than ever of success. The 400 acres of land on which the beets for the factory are grown, are rented from farmers who do the plowing, cultivating, etc. The total cost per acre is estimated at about $40, and the yield at from 10 to 20 tons. On the basis of 10 tons to the acre it is estimated that the beets will cost $4 per ton at the factory. In Los Angeles Co., California, experiments in drying beets have resulted in considerable loss of money. It is thought that unless the roots are dried by some new and more economical process the business can never be made profitable. In Canada, the machinery for the beet sugar factory at Berthier arrived last June, and the factories at Choaticooke and West Farnham are also ready. There is talk of starting beet sugar factories at Rochester, Elmira, Middletown and Wurtsborough in this State.

BREVITIES.

"THE Fair at Jackson, Mich., was simply immense," says our special correspondent.

THE price of the Hoosier Drill should read $20, instead of $15, as it does in our Premium List.

THE tomatoes from which we are saving seeds keep perfectly sound from 12 to 17 days..

THE grubs are unusually troublesome this Fall, and are killing many of our strawberry plants.

WE were pleased to receive a call, a few days since, from the distinguished pomologist, Dr. John A. Warder, of Ohio.

WE commend the letter of G. G. of Liberty Co., Texas, to our readers as showing what the Rural Branching Sorghum will do in some regions.

HENRIETTA Raspberry (Belle de Fontenay?) is now ripening a good second crop at the Rural Grounds without any rain since it bore the first crop.

THE new Champion Quince of which we have one specimen, bears two quinces this year not yet ripe (October 3). The others rot as fast as they ripen.

THE idea is getting abroad in England that the usual harvest "thanksgiving" services are peculiarly absurd this year, in view of the poor yield and quality of the crops.

ONE of the best specimens of wheat which we have received this season was sent by Prof. Ingersoll, late of Mich. Ag. Coll., now of Perdue University, Illinois. It is a cross between Lancaster and Armstrong.

DESMODIUM penduliflorum (figured in RURAL, p. 433 has not been affected by the drought in the least. It is still blooming freely and is at this time the showiest blooming shrub in the Rural Grounds. It is a very desirable little plant.

IN consequence of the short supply of milk, due to the drought and the necessity of feeding cows on winter feed, the price of milk in this city has been raised from eight to ten cents a quart by retailers. From our "exchanges" we also learn that the farmers who supply other large cities are, as a rule, raising the price of the product.

THE Liverpool cotton "corner" has triumphed, the cotton spinners having all resumed work with no intention of again suspending it in the hopes of breaking the corner. Speculators who sold cotton "short;" that is sold what they hadn't got, in expectation of a fall in prices before the date of delivery, are settling up as best they can. The chief engineer of the corner is, it seems, after all an American named Ranger.

A SPECIAL meeting of the Board of Managers of the International Dairy Fair Association and of the butter and cheese trade of New York, was held here last Friday to arrange for a grand display of dairy products at the Atlanta Exposition. A resolution was passed urging merchants, manufacturers and dairymen to contribute liberally, and the following committee was appointed to secure representation and attend the exposition:—G. B. B. Douglass, M. Folsom, W. E. Smith, L. D. D. Hunter, J. H. Goolt, B. F. Van Volkenbergh, T. H. Newman, Daniel E. Manton and Washington Winsor.

IN Herrman vs. Adriatic Insurance Company, Judge Folger, of the New York Court of Appeals, has decided that leaving a dwelling-house unoccupied during the Winter will render a fire policy void, which provides that "if the premises should become vacant or unoccupied and so remain for more than thirty days, the policy shall become void." In delivering the opinion—with regard to a country house—Judge Folger said "that an inspection of the house every fortnight by the owners and every week by a neighboring farmer would not avoid the conditions, neither would the occupation of some of the other buildings on the place and included in the same policy, avoid the condition as to the dwelling-house and the out-houses appertaining thereto."

THE latest estimates of this year's cotton crop are as follows: Latham, Alexander & Co. of this city, from sixty telegraphic reports, put the yield at 32 per cent less than that of last year's crop with four per cent. increase of acreage. The aggregate possible yield they figure out at 6,188,000 bales. A prominent New Orleans cotton house estimates the shortage of this year's crop at 30 per cent. and expects a grand total of 5,500,000 bales. Bradstreet has received reports from 839 correspondents in 500 counties in the Cotton Belt and after careful figuring concludes that the crop is 34.5 per cent. short of last year's yield; though with favorable weather henceforth there will be a slight improvement. The staple is somewhat better but the yield of lint cotton from the seed cotton is held to be smaller than usual.

IT seems likely that the continued dry weather will prevent the seeding of as large an acreage as usual to wheat this Fall, so that the unfavorable conditions of this year are likely to lessen next year's crop. Wherever timely rains have enabled farmers to put in a crop, however, the area has been considerably increased; but reports from many sections show that the seed has either entirely failed to germinate or, having done so, has been "burnt up." The potato crop throughout the country is fully thirty per cent. under the average, and thirty-two per cent. in New York, Pennsylvania, Ohio, Michigan, Illinois, Wisconsin and Iowa, which together produce three-fifths of the entire crop. The scarcity of fodder is forcing stock heavily on the market, especially the poorer sort, which has a depressing effect on prices, but will probably ultimately prove advantageous by weeding out unprofitable animals from the herds.

OWING to one of the mysteries of railroad transportation cotton can be carried from Memphis to Boston at lower rates than from Memphis to New Orleans. Says the New Orleans Democrat: "There is no visible reason why rail freights from Memphis should be cheaper to Boston than to New Orleans. The proposition is on the face an absurdity." As if, in sooth, there were not hundreds of things in railroad management that cannot be explained by visible reasons. On the face of it it is an absurdity that freight can be carried from this city to Chicago cheaper than from this city to Utica. It is an absurdity that passengers can be carried from Boston to Chicago for eight dollars when more than that must be paid to go one-fourth of the distance over the same line. It is an absurdity that the public should be required to pay heavy interest on fictitious capital created by "watering" stock. It is an absurdity—but merely to enumerate the "absurdities" of railroad management would require a whole page instead of the few lines that should be the limit of a "Brevity."

For Women.

CONDUCTED BY MISS RAY CLARK.

MOTHER'S HUCKLEBERRY PIES.

How oft goes memory back to childhood,
When picking berries on the hill,
With pail in hand I'd strip the bushes
Along with little brother Will!
What cared we for the heats of Summer
With broad straw hats tipped o'er our eyes?
For, with those very huckleberries
Our mother made those famous pies!

I see her now, dear cherished mother,
With apron on as white as snow,
Her plump arms bare up to the elbow,
And on her cheeks a rosy glow:
I seem to see her roll the pie crust,
And fill the plates of largest size;
For well she knew how hungry children
Enjoyed her huckleberry pies.

And father, he'd come in from haying,
And stand by mother very near,
And say: "Now, wife, in all the township
None make such pies as you do, dear,
Except, perhaps, my dear old mother;
Why, at the fair, you'd take the prize.
Come, children, now we'll all to dinner,
And have a feast of mother's pies."

Those dinners now I well remember,
Within the kitchen large and cool;
Those summer days of our vacation,
When we were free of books and school.
Ah! can it be of years full thirty?
And yet it must be! how time flies!
Since we sat in that farmhouse kitchen
And ate in childhood, mother's pies.

Within our modest home is sitting
An aged lady, saintly fair;
While at her side my lad and lassie
Are looking up with earnest air.
"Grandma," they say, "we picked these berries,
We meant it for a great surprise."
And Grandma smiles and says, "My darlings,
I'm not too old to make good pies."

—MAUD MILLER.

DESCRIPTION OF CUTS.

FIG. 479.—MARCHIONESS OF BLANDFORD.

FIG. 480.—COUNTESS OF CLARENDON.

FIG. 481.—MISS SINCLAIR.

FIG. 482.—MRS. CAVENDISH BENTINCK.

These cuts represent the costume of ladies at the "Olde English Fayre" held in England

FIG. 479.

in June last. The object of these reproductions is not to give portraits, but to show the style of dress. They will serve as guides for costumes for participants in fancy dress entertainments, the time of which is drawing near.

FIGS. 483, 486.—MONOGRAM IN SATIN STITCH.

FIG. 485.—CORNERS: EMBROIDERY.

FIG. 484.—MONOGRAM FOR EMBROIDERING PILLOW SHAMS, ETC.

These corners are suitable to be worked in white or colored cotton upon collars, handkerchiefs, tidies, etc.; the designs are in satin, cording, or knot stitches.

FIG. 487.—DESIGN FOR LAMBREQUIN OR OTHER DRAPE.

SUMMERING.

R. B.

AMONG the crowd of those who went from home, seeking rest for mind and body, during the Summer months, I for one have come back with a feeling of delicious refreshment, and with many pleasant memories.

I will give you just a glimpse of where and how I went—or rather we, for I did not go alone. We were a feminine trio, exhausted mentally and physically. We decided to try the Catskills as the field for our recuperation.

"Girls," said Miranda, as she folded a pitl of examination papers, "we haven't a fortune to squander this Summer, and we do not want to be bothered much about clothes; we do not

FIG. 480.

want to meet crowds of people, nor to have to be dignified and proper. Let us hunt up a farm-house somewhere, where the people are ignorant of the last new agony of style, where we can do just as we please without shocking anybody. I want to live out-of-doors, to swing in a hammock and lie on the grass, to ramble over the hills and climb the steep places and wear out my old dresses and shoes."

"That's my view of the case exactly," said Abigal. "I haven't time to get ready; all I want is to be off."

We looked up advertisements and wrote letters of inquiry at once, in answer to which we received several epistles, some of which were assurance enough that the writers had never even heard of Boston, so that we were on the right track if we wanted quiet, unconventional places.

One letter was so especially unique that its very lack of literary merit attracted us. It was written with an utter disregard of rhetorical rules, capitals were thrown in promiscuously, and it was guiltless of punctuation, except a period here and there in the wrong place. Yet there was a heartiness about it, in spite of an extravagance in announcement, that savored of impressions received from the studied perusal of the periodic circus bill. "A quarter of an aker of crokay ground and home Priveliges very long Piazza and eggs. fresh Fish and my daughter has had Musick lessons which she will exhibit to them staying here and is perfectly Grand. I'll garanty you that yewl always be sorry if you Miss Coming for were moren able to make you happy and only charge reasonable."

"If we do not like it we can change. Let us go to this private heaven. A quarter of an acre of home privileges, long eggs and fish reasonable! What more could we ask?" said Miranda.

So we went. Our journey was part of the way by boat up the Hudson, and then a veritable stage ride to our destination. We began to look out for the house with some misgivings when we found ourselves nearly there, and we fairly shrieked with laughter when the stage stopped and we caught sight of that piazza. It was indeed long, but it was undeniably narrow.

"He did not mention the width because there was not enough of it to mention," whispered Abigal. We found a typical country home, with no sign of ceramic craze or any touch of art insanity. Some framed certificates graced (?) the walls, with a sampler nearly a hundred years old. There was a cabinet organ in one corner of the sitting-room and and some wide old rocking-chairs stood invitingly about. All was severely neat and the most of the appointments were very primitive, but there was an unmistakably homey look about it all. Our hostess had a fresh, smiling face that won our hearts at once, and she was very kind and anxious to please. When we had refreshed ourselves and went down to tea we found the table all that was desired.

There was fresh, nice bread, butter that was beyond the faintest suspicion of oleo.! dried fish, cottage cheese, milk, good tea, and a large glass dish of luscious wild strawberries buried in delicious cream. We ate as we never ate before, it seemed to me, and then, after unpacking, we went to our rest in very comfortable beds.

I will not attempt to tell of the quiet, restful days that followed, how we wandered out into the little grove to read and talk, or swung in a hammock, or over in the old swing in the lane; how we betook ourselves to the cool ravine on hot days, though we did not suffer much with heat up there; how we explored the country for miles around; how we took off our dignity and our shoes and crossed the brooks on stepping-stones; how we laughed and grew brown and too large for our clothes. We pitied our friends who had gone to more fashionable places, who had to spend time and thought on toilettes, and who could not indulge in that abandon that was giving us new life and vigor.

When the time came to leave we wished we could stay longer, but visits to old friends called us in different directions; but these were really only variations of our blessed idleness.

We decided to return by a different route, so that we might have a fuller view of the mountain scenery. We therefore engaged a neighboring farmer, who kept a team and covered vehicle for such trips, to take us to a town thirty-five miles across the hills.

We started in fine spirits. The morning was a little cloudy, but all the more pleasant for that. "I never stop for cloudy weather," said Mr. Q. "My step-father always used to watch the weather, and I've known him to put off a trip for two weeks and then get a rainy day after all. When I get ready I go."

Mr. Q. was a big man with a broad, comfortable back, which rounded over in that particular shape on which the coat always rides up in ridges across from under the arms. He had a fine team and a good brake on the stage and was a model driver. He soon established quite fatherly relations, inquiring our given names, and discovered that two of ours were those of his wife and daughter and the third that of a former "spark." He entertained us with information about the "mountings" and the "mountainous region," the method of harnessing and driving "tantrum," etc., in a style and pronunciation entirely his own. We visited the Mountain House, taking in, on our way up the mountain, the Rip Van Winkle Notch. The House faces a cliff in the rocks, through which one gets a glimpse of the Hudson and the far stretch beyond. We spent a little time at the Mountain House enjoying the fine view from its elevated site, and then went on to Laurel Hill. The hotel was filled with Summer guests, who could hardly have chosen a more picturesque spot. There are the Canterskill Falls, to see which visitors pay twenty-five cents. A good path has been made and fenced above the dangerous precipice, while many flights have steps leading down to the second fall. It detracted slightly from the beautiful scene to find that the slender stream which runs constantly is increased by machinery, is literally turned on, when people go to see it. It comes then with a rush and roar, and as it falls from a great hight it descends in mist and spray, whence comes its name—The Bridal Veil.

(To be Continued.)

"J. W." ANSWERED.

As "J. W." suggests, I *am* a very busy woman, though not so overworked, day in and day out as to disgust me with labor, physical or mental. Still if he has laid that

FIG. 481.

chip on his shoulder, I think I have time to knock it off. He—of course, it is a man—seems to be in doubt whether the quotation "In the sweat of thy face shalt thou eat bread" is Shakespeare or Bible. When he has occasion to take a journey again, if he will use the Bible, the Y. M. C. A. provides for the use of the public in the cars he will find in Gen. III, 19, that labor was meant emphatically as a curse. If it was a pleasure, the boy would not have to be *taught* to labor. He would take to it as naturally as to marbles or fishing.

Intemperance is a pleasure—gambling is not labor. Very few vices have to be taught. They come naturally. All the same they are curses to humanity. The sole refuge that God gave in the beginning to stay the vast flood of turgid vice that his Omniscience saw would sweep the world through, was the necessary *curse* of labor. When the world through the eyes of Adam and Eve saw vice, "become as gods knowing good and evil," chose the evil, they could not be left idle longer. "Thorns and thistles, potato bugs, army worms, murrain, pleuro pneumonia," for the former to keep him busy. Physical suffering for the physician, hard won cases for the lawyer. The "Devil and all his works" for the preacher to fight, and dust and disorder for the good housekeeper, makes a laboring world, while the "last enemy" lies in wait at the end that we all labor to escape and circumvent.

FIG. 482.

We all try to escape the *penalty* for transgression, and calling labor a blessing only shows how demoralized the whole of humanity has become, when we "hug our chains," and do not realize our degradation. Only when the pressure is removed, and the curse lifted, will we be able to see that life without labor, and under different conditions is, the perfect life.

Meanwhile I intend to take my share of the curse cheerfully if I can, and not slide it to the man's shoulders, though originally it was not intended for the woman. O. W. D.

ABOUT WOMEN.

MARIAN HARLAND, the novelist, is the wife of a Doctor of Divinity.

THE late czar was the first sovereign under whom women were freely allowed to practice medicine in Europe.

SIGNORA RISTORI is said to be quite an English scholar. She is very anxious to play Lady Macbeth in London.

MISS LOUISA BIRD, the great traveler, the lady who has explored by herself the Sandwich Islands, ascended the Rocky Mountains, and visited the untrodden parts of Assam, is going to be married.

POOR Lady Mountmorres has had three relapses of pleurisy, now followed by an abscess. Lady Mountmorres has never recovered the shock of her husband's cruel murder in Ireland a few months ago.

THE visit of Her Majesty to the Palace of Holyrood has been looked forward to with great delight by the loyal-hearted Scots, who rejoice in the idea that those long-silent halls will again echo the tread of royal footsteps.

THE mother and wife of our late President are now at their home in Mentor, Ohio. It must be a satisfaction to them, shrouded though it is in the deepest gloom, to feel that public scrutiny is at an end and that they can mourn in secrecy yet knowing that the sympathy of all stretches out to them.

A WEALTHY lady occupying a cottage at Mt. Desert had a jewel case made in imitation of a Bible. A burglar visited her premises, of course, avoiding the Bible as the devil would holy water, he carried off the silver-

ware, but left the diamonds and their fellow jewels safely in their meek retreat.—The Rural West.

THE Princess Louise will return to Canada this month. Her Royal Highness has lent her beautiful studio in Kensington Palace to Miss Hilda Montalba. This lady, who has lately returned from Venice with her sister, Clara Montalba, is busy completing a picture began in the city of canals and palaces. It shows three Venetian girls hurrying home through the rain. Misty tints envelope the distant dome of San Marco and shroud the vistas of water and buildings, throwing into relief the brilliant tints of the Italian maidens' costumes, and their bright faces.

Literary.

THE POPPY.

THE man who roams by wild-flower'd ditch or hedge
Skirting the mead,
Or treads the cornfield path—along its edge
May mark a weed,
Whose ragged scarlet gear might well denote
A roadside beggar in a soldier's coat.

Hence! terms misplaced, and thoughts disparaging!
Oh, Poppy-flower!
Thou art a Crœsus of the field—its king—
A mystic power,
With emblems deep and secret blessings fraught,
And potent properties that baffle thought.

When thy hues catch, amid the growing corn,
The traveler's eye,
"Weeds! weeds!" he cries, and shakes his head in scorn;
But when on high
The grain uplifts its harvest-bearing crest,
The Poppy's hidden, and the taunt suppress'd.

So, when our early state is poor and mean,
Our portion small,
Our scarlet-blushing moral weeds are seen,
And blamed by all;
But as we rise in rank we win repute,
Our faults gold-hidden, our accusers mute.

THORNS AND ROSES.

CHAPTER III.

(Continued from page 675.)

Sometimes, when I was in the cottage of some friend, he would enter, meeting with a reception that showed that he was perfectly at home with poor and humble, and that they were at ease with him.

FIG. 483.

I saw him often when he did not see me, thus gaining an insight to his character, though he puzzled me much. He led a good life, I was sure, but his melancholy was seldom lifted; his gravity was undisturbed.

I had once or twice visited Newville, and Mrs. Verner was always pleased to see me, I being her favorite, as her son assured me. We saw a good deal of him, and for his selfishness I looked in vain.

Edith laughed at his visits in his absence; and once in his presence said, with affected innocence, that he must have much more time on his hands now than he had in former days; to which he replied that by his mother's desire he had given up shooting.

Edith retorted that this was scarcely the shooting season; he answered that he trusted his visits were not unwelcome, and Miss Edith might remember that in giving up the idea of shooting, he had given up many calls.

Of my cousin's character I could form no clear idea; she seemed all contradictions—now wild and sarcastic, now dull and weary; now all mercenary and cold, and then showing me glimpses of true affection.

She had a good heart spoiled by her education; a high nature unfortunately perverted; her faults might have been eradicated by careful training and a mother's love. She disliked me, yet she delighted in teasing me; she liked aunt, yet loved to play tricks on her and utter sentiments that shocked the good, unworldly lady. Nevil she treated with contempt; Brandon as she treated me.

Nevil and Brandon came in the evenings, and we four played croquet: despite Ethel's declaration that it was hideously old fashioned, and as much out of date as powder and patches; but aunt was opposed to such innovation as tennis or skittles, the very name of the latter grating on her ear.

I was very happy—happy in a new joy which I did not then understand—which I could not define but which was one day to become clear.

CHAPTER V.

The change of Summer to Autumn had brought few changes to us, not interfering with our pleasant life; the woods, though their fresh green color had gone, were yet beautiful in the changing hues of Autumn, a few late roses were in the garden, and the days of the Indian Summer were as bright to me as those gone by. Edith was still with us; she had vacillated for two days between going and staying, on receipt of an invitation elsewhere, but finally decided in favor of our home, saying that she would like to see how it ended, though what "it" was she did not explain.

Those about me seemed unchanged, but in myself I was conscious of a new feeling, only lately roused, against which my struggles had been vain. I knew that Nevil loved me, though he had never said it in words; but deeds are often more eloquent, and it was in act that he showed his love. Why, then, should I strive to crush my own love for him? Perhaps my pride caused it, and made me distant and reserved; he must often have thought me cold and haughty, but it was not in my nature to be very demonstrative in affection, nor could I give love or friendship easily, though the last kindness woke my gratitude. My world had had a limited horizon; it was limited now; and my friends had been few but faithful.

Looking back on the Summer months and Autumn weeks, I remember for how short a time I had known Nevil, and felt that we could not possibly understand each other, and was angry with myself; but I had kept my secret well; even he could not know that I loved him. That his visits were principally to me everyone seemed to understand, and as far as aunt Dorothy was concerned he was favored. I had not forgotten my cousin's words, but I did not think him selfish; a little vain he might be, yet who is without a blemish? These, when Autumn days were passing, were my feelings; and whether Edith or I read Nevil Verner rightly, time would try.

A lovely Autumn evening—calm, clear, and still—and Edith and I were walking to and fro in the garden, she, as usual, speaking against Nevil Verner.

"Oh! Kate," she said, "I wish you were not so obstinately blind to people's faults! Nevil's very conversation might show you what he is; but you are all disagreeable people here—you with your pride, Nevil with his conceit, and Brandon with his gloom! Why is he so dismal?"

"Is dismal the word, Edith? I don't think it applies to Brandon. He may have reasons for his gravity."

"I did hear that his father was unkind to him; but in that case, Brandon ought to have been relieved by his death. I saw him a little while after it, and he looked miserable; though, if his father were unkind and all the rest, there is no reason why he should break his heart for the loss of such a parent."

"He was grave as a child," I returned, little thinking how her words would come back to me. "It is his nature. He has never spoken of his father, and I don't like to do so."

"I never heard Brandon speak of him either. I suppose he died suddenly. My impression is that Brandon has had a disappointment long ago, and it has soured him.

As she spoke Braudon appeared, but not alone, for Nevil Verner followed him, at the

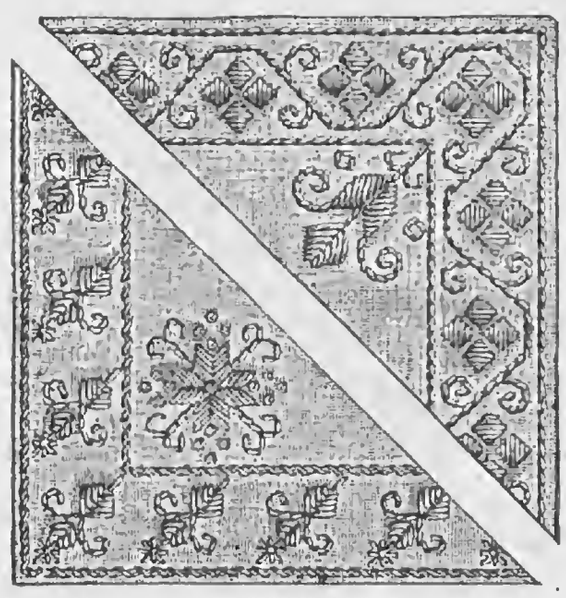

FIG. 484.

sight of whom Edith tossed her head.

"What a lovely evening, Brandon!" she said, drawing him away, after extending two fingers to Mr. Vernor.

Nevil and I followed slowly, and though I felt rather nervous, I wrapped myself in calmness as with a mantle, for I was too proud to make myself absurd.

"You have not been to see us lately, Miss Lovell. My mother missed you very much."

"I intend to call soon with Edith."

"With Edith!" he repeated, glancing towards that lady, who was devoting herself to Brandon. "How very unlike each other you two are; and I must say that you are my mother's favorite. She knows, of course, that Miss Edith is pleased to dislike me, and that influences her—her love for me being one of her faults."

"Is it a fault, Mr. Verner?"

"Some think so. A mother is blind to one's imperfections, friends are not; you are amongst them, Miss Lovell?"

"Amongst the friends or the fault-finders?"

"The friends, I pray. You are very proud, Miss Lovell, and your esteem is hard to win; I have tried to win it, and if I have succeeded, I may gain what I value still more—your love."

"Just at this moment Aunt Dorothy called us in, and Edith came running to us. We returned to the dusky parlor, and how the evening passed, what I said or sung, I do not know, for I felt as one in a dream.

Tenderly and lovingly did Nevil take leave of me, and that night my sleep was unbroken, for he loved me, and he had revealed it.

Autumn went by, and chilly winds and gray skies foreshadowed the Winter.

I persuaded Edith one day to ride with me to Mrs. Verner's, and after prophesying that we should be overtaken by a snowstorm, she consented, and we set out together. As we cantered over the common, I saw a man slowly crossing it, and wondered if he were

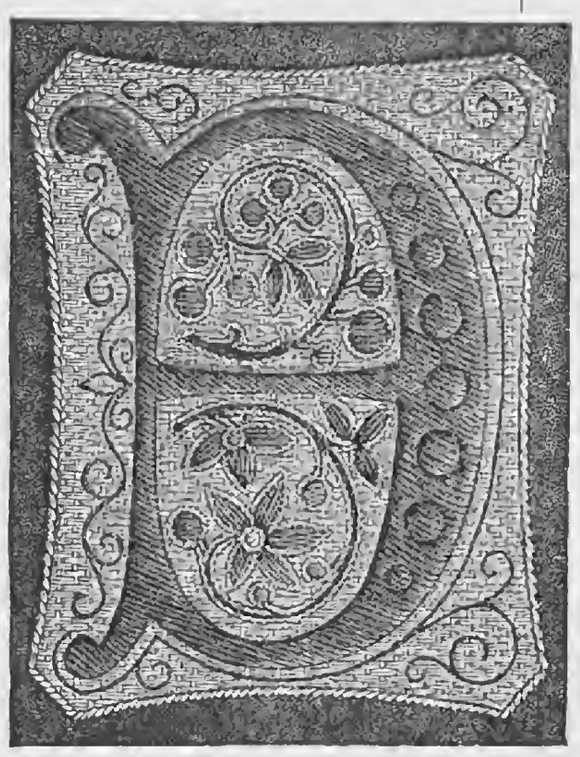

FIG. 485.

Brandon. Hearing the sound of horse-hoofs, he looked round, and stood aside to watch us go by; he was, as I saw at once, a stranger, and as such I would have passed him, but he raised his hat, and Edith bowed.

"Who is your friend?" I asked, as we rode on.

"I have seen his face somewhere," she replied.

"Why did you bow?"

"He bowed to me. Oh, I remember! he's the gentleman who traveled down to Royton with me, I know his smile, because it reminded me of aunt's gray cat."

"He claims acquaintance with you because he chanced to be your railway companion once?"

"I don't know. Perhaps he is a book-agent waiting orders. What a fuss you make!"

I was not making a fuss, only her bow had struck me as being very cordial to a stranger. On arriving at Newville, we found Mrs. Verner alone, and Edith seated herself at the piano.

We two had spoken together under cover of my cousin's music, Mrs. Verner suddenly seized my hands, looking earnestly at me and speaking softly.

"Kate, you know that my son loves you—he does indeed! From the first he admired you. He is the best of sons, and will you not think well of him.

What could I answer to the mother pleading for her son? I could not say, "I love him," for woman's pride forbade it.

"Are you angry, Kate? He tells me you are proud—that he scarcely dare speak of love to you. You must not tell him that I said this. I could not help it, because you hold his happiness in your hands."

"We have known each other so short a time," I urged.

"It is many months since you met, and you surely don't doubt him? His goodness, his upright life, his kind heart, may surely plead—"

She broke off, for Edith, rising, declared she was tired of playing, and joined in the conversation.

When our visit came to a close Mrs. Verner gave me a kind smile; but her eyes were sad, for she did not see that I loved her son, and perhaps thought with him that I was cold-hearted.

Riding home, Edith asked me if I were not tired of hearing Mrs. Verner sing her son's praises?

"It is provoking to see anyone so blind," she said; "and how meekly she worships Narcissus!"

"I wish you would talk of anything save people's faults?" I said. "You often say you are bored. Did it ever strike you that you might be boring?"

FIG. 486.

"That's like a Lovel!" she said, with perfect good humor.

But it was one of her virtues not to be easily offended.

We passed Kingston and curiously enough the stranger to whom Edith had bowed was gazing through the park gates, as though lost in admiration; but as we passed he looked round, and Edith dropped her whip. He hastened to restore it, and she smilingly thanked him, then inquired if he were going to see Mr. Lovel, for that was his residence; but the stranger was merely admiring the ground and had not the pleasure of knowing Mr. Lovel.

"Nothing but meetings, Kate!" said Edith, as we rode on. "I dropped my whip purposely; but you need not look shocked! I want amusement.

"Edith, do you think this right?"

"Don't get excited, love; calm yourself. He may be a prince in disguise, for love tales often begin on the railway; it's the fashion now-a-days."

There was a light in her eye, a smile on her lips that puzzled me: but of the stranger we said no more.

I thought often of Mrs. Verner's words and of Nevil's love, which was now apparent to us all, and, seeing it, Edith refrained from speaking against him, though she provoked him as much as ever. Why did she dislike him? He was so kind and gentle, and "the best of sons."

Was I obstinately blind to his faults, as Edith said? Was I mistaking for gold mere false, glittering metal? It could not be. I loved him because he was good, because he was kind; but who can tell why they love? "Is human love the growth of human will?"

Brandon often came to see us, and we spoke of bygone days together, to aunt's delight, and even Edith's, as she liked our grave kinsman though she ridiculed his gravity. One evening in particular of those many Autumn evenings I remember, when he came earlier than usual, feeling, he said, dull and looking very pale and weary.

"You study too much," aunt said, "and it is not good for you, because it makes you sad and absent minded. You'll lose your memory soon."

"I wish I could," he replied, in a tone that struck me and fixed the words in my mind, whilst Edith laughed and stared.

"Don't study too much," I said, when he was going, and we stood in the porch.

"Oh, no! But my books are my friends. Good night."

FIG. 487.

"Good night," I echoed, and he was gone.

* * * * *

Brandon Lovel rode home rapidly through the lane, carpeted with fallen leaves, over the bleak common, through the quiet village; until he reached home. Crossing the hall, he entered a room lighted by the flame of an antique lamp, and the red glow of the fire, and throwing down whip and gloves, he stood gazing before him in reverie, until his glance fell on an open book lying on the table; some passage attracted him, or perhaps from mere force of habit he sat down, and, leaning his head on his hand, began to read.

[To be continued]

NEW PUBLICATIONS.

THE LEGEND OF THOMAS DIDYMUS, THE JEWISH SKEPTIC. By James Freeman Clarke. Boston: Lee & Shepard.

The above-named book is a brief commentary on the life and times of Jesus Christ, depicting the belief, opinions and prejudices of the Jews. Our Lord is represented not in an ideal form, but personal, as he appeared to the people of his own day. Thomas relates much of what transpired when he accompanied the Saviour in his work of doing good, and, as it is written in an easy, fluent style, the reader is at once interested and, as it were, is made a participant in the happy scenes. We commend it to all for thoughtful perusal.

JOURNAL OF A FARMER'S DAUGHTER. By Elaine Goodale. New York: G. P. Putnam's Sons. Price $1.00.

This is a charming little work from the pen of one of the "Sky Farm Poets," and is the first prose work they have written. It is a journal of farm life, and in the first paragraph the young authoress declares that it is a pleasant, aye, and a profitable thing to be a farmer's daughter! Elaine has succeeded in relating some experiences at "Sky Farm" in a very pleasing style. It is a book which will be perused with delight.

REVISED ODDFELLOWSHIP ILLUSTRATED. By Professor Blanchard of Wheaton College, Chicago: Ezra A. Cook, Publisher.

This is a book of 281 pages, devoted to an exposition of the secrets of Oddfellowship which the author says "is a false religion and therefore utterly at variance with the religion of the Bible." It is on the same plan as "Freemasonry Illustrated" and "Knight Templarism Illustrated." It is a book which will be read with interest, as its statements are said to be made on facts.

DYSPEPSIA: HOW TO AVOID IT. By Jos. F. Edwards, M. D. Philadelphia, Presley Blakiston. Price 75 cents.

The author in this little work of 87 pages discusses a subject which many would like to know more about than they do in order to avoid the disease. There are four chapters on "Food," "Digestion," "How to cook Food" and "How and what we ought to eat." It will repay a careful perusal.

FIRST LESSONS IN GREEK. By Wm. S. Scarborough, A. M. New York: A. S. Barnes & Co., publishers. Price $1 25.

This little work for beginners in the study of the Greek language is on the plan of Jones' First Lessons in Latin. A cursory glance leads us to think it well adapted to its purpose.

THE GEORGIANS. A Novel. Published by Jas. R. Osgood & Co., Boston. Price $1.00.

This is the third of the Round Robin series, and a book in which is strikingly depicted some of the original types of Southern life and character. It is full of interest.

SINNER AND SAINT. A Story of the Women's Crusade. By A. A. Hopkins. Boston: D. Lothrop & Co. Price $1.25.

This is a notable addition to temperance literature, and, although it is written in the novel style, in it the author touches some of the vital elements of the temperance reform.

FRIENDS: A Duet. By Elizabeth Stuart Phelps. Boston: Houghton, Mifflin & Co.

Anything from the pen of the well-known authoress of "Gates Ajar" will find a hearty reception with the reading public.

ROCKLAND CEMETERY. Illustrated. By William Wales. New York: Randolph & Co.

A very nicely gotten-up book, descriptive of this beautiful cemetery in Rockland, N. Y. It contains 20 illustrations.

HAND-BOOK OF USEFUL TABLES. Finch & Apgar, publishers.

This is a handy reference book for the farmer and mechanic, and should meet with ready sale among them.

DIARY OF A MINISTER'S WIFE. By Ahuedia M. Brown. J. S. Ogilvie & Co., 29 Rose Street, New York. Issued in two parts. Price 10 cents each.

THE SCHOLAR IN A REPUBLIC. Wendell Phillips. An address at the Centennial Anniversary of the Phi Beta Kappa of Harvard College, June 30, 1881.

BRIC-A-BRAC.

THE BANGING MANIA.

O see the young girl,
In beauty rare,
Sans kink, sans curl—
Banging her hair.

And hear the young man
At the piano there,
Hard as he can—
Banging his air!

A young mother stands
Oppressed with care,
With slipper in hands,
Banging her heir.

A BOSTONIAN MISTAKE.—At a late Boston party the host said to a guest: "I beg you to entertain Mr. Blank a little; he looks utterly forlorn and bored to death. I will introduce him and you must interest him. By the way, his strong point is butter, on which he has written a book." The lady guest graciously undertook the task of entertaining the man, inwardly wondering that he should be so much interested in butter (of which she knew very little), when his face indicated a mind given to much profound thinking. However, with butter in view, she began on the weather, gradually got to the country, then onto a farm, from that to cows, and at last to butter. The man looked more bored than ever, the magic word producing not the slightest effect, and he somewhat abruptly left her, and soon withdrew from the house. "I did my best," she explained to the hostess; "I went through agonies to prove that I was deeply interested in butter, but it was all in vain." "Butter!" exclaimed the hostess, "What possessed you to talk to that man of all men on *butter?* I told you he had just written a book on Buddha, and I knew how deeply you, too, were interested in the same subject." And they said in chorus, "Gracious!"—Boston Transcript.

THE RHYME OF THE REPORTER.

With fingers blackened with ink,
With eye-lids heavy and red,
The local editor sat in his chair,
Writing for daily bread.
The small boy was by his side,
The foreman grumbled and swore,
And the office boy like an "Oliver Twist,"
Constantly cried for "more."
He had hold of a broken leg
That had never been broken at all;
He had killed off the nearest friend he had
And tore up the house in a squall,
And now he was at an end, he hadn't an item left;
And he bowed his head to the small boy's scorn,
Like a fellow of hope bereft.
They found him a corpse that night
In streets so drear and sloppy,
With the foreman whispering into his ear
And the small boy waiting for copy.—Gate City.

RECIPE TO SUBDUE A HUSBAND.—Mr. and Mrs. Topnoody were getting ready to go out to call on a friend the other evening, and Mrs. T. desiring to look well was arranging herself in a great variety of colors. Topnoody noticed it, and began to comment. Said he, "Mrs. Topnoody, I think a woman of your age ought to wear more subdued colors." "Oh, do you?" was the response. "What would you suggest as becoming to your angel wife?" "I think a black dress is simple, tasteful and always becoming." "Indeed?" "Yes, indeed." "Well, then, Topnoody, suppose you die and leave me a widow, so that I can wear the color you think most becoming to me. Of course you can't see me in it, but it would be such a pleasure and comfort to me to know that I was pleasing my poor, dear, dead husband." Then Mrs. Topnoody smiled in such a very satisfied way that Topnoody concluded his suggestions were possibly too previous, and he busied himself in tying his necktie while Mrs. T. distributed the rainbow tints as she pleased.—Steubenville Herald.

THE BOSTON GIRL.

I told her of a maid whose mind
Was filled with tender thoughts and fancies,
A lovely being of the kind
They write about in old romances.
"Knowest thou," said I, "this maiden,
Whose beauty doth my thoughts beguile?"
She answered with a dreamy air—
"Well, I should smile!"

"Her cheeks possess the rose's hue,
No form is daintier or completer,
No hair so brown no eyes so blue,
No mouth is tenderer or sweeter.
The favored youth who gains the hand
Of this fair girl, will ne'er regret it.
With modest grace she added: "And
Don't you forget it."

"O thou dear mistress of my heart!
My angel! let me kneel before thee
And say how heavenly sweet thou art,
And how devoutly I adore thee."
She turned away her lovely head,
And with a languid look that fired
My soul, in murmured accents said,—
"You make me tired."

—David S. Foster, in Scribner's for June.

EVEN the philosophers often have the laugh turned on them. A little boy said in the presence of Herbert Spencer: "What an awful lot of crows!" The philosopher corrected the youth by saying: "I have yet to learn, little master that there is anything to inspire awe in such a bird as the crow." For once the author of first principles met his match. The boy replied: "But I didn't say there was. I didn't say, what a lot of awful crows! but what an awful lot of crows!" Sound for the boy.

A merchant possessed a fine yacht
Had money, a house and a yacht;
In business he trusted,
And therefore he busted
And now it is all "gone to nacht."

A LOST OPPORTUNITY.—A Clevelander who had put in two weeks at the Flats, came down on the boat on his way home. Among his traps he had something in a box which claimed considerable attention, and a man finally approached him and said: "I see you caught one." "Yes." "Going to take him home?" "Yes." "Was it the largest one you saw up there?" "Oh, no; this is only a young one." "Going to tame him I presume?" "Well, I guess so." Did he bite you?" "Bite me? Why, they never bite. You know what sort of a bird this is, don't you?" "Of course I do. That's a St. Clair Flats mosquito, isn't it?" It was a splendid opportunity, and the temptation was great; but the Buckeye was a truthful man, and he sighed as he replied: "N-no, sir. That is a St. Clair Flats mud-hen. I didn't see a 'skeeter over half as large as this."—Det. Free Press.

CAULIFLOWER.

Oh cauliflower! thy blossom sweet
Makes most delicious food to eat,
And when I see thee float in cream
I'm awful glad you are not a dream.

It must be enough to provoke a saint,
To dream of thee and awaking, faint,
With strong desire to swallow thee down
Discover that you are not—in—town.

"HAUGHTY-CULTURE-ISM."—Lady: "Wish to leave, Parkins? But you only came yesterday!" Parkins: "Yes marm. Hin engaging I thought you was sparrergrass gentry; but when I 'ears from the cook last night that you eat pertaters and cabbige, carrots and sich-like second-hand vegetables, I ses there ain't nothing hesthetic in it, and I resigns my staff of horfice, so to speak."

FUN AND FANCY.

A plate of hash and a brindle cat
A sailing on the sea:
For your sister's beau a pink cravat,
To climb a hickory tree.

For thee a stick of taffy sweet,
(Onions are strong in the onion bed!)
A blue-eyed pug for me to greet,
(Still, oh, still are the entombed dead.)

An oyster stew or two for you,
(Oh clams are fifty cents a peck!)
For me a schooner of Mountain Dew,
(Two glasses for a ten-cent check!)

For you a stroll upon the sand,
(Red is the nose of he who drinks!)
For me three pairs in a poker hand,
(Bologna sausage is sold in links!)

—The Wild(e) poet of the Norristown Herald.

BY nature the smaller strawberries are so modest and shrinking that they crawl down to the bottom of the boxes, leaving their large brethren on top, greatly to the chagrin of the venders of the fruit, who are so self-conscious as to entertain the foolish idea that buyers will suspect them of having placed the big berries on the top for the mercenary purpose of tempting them to invest.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

DOMESTIC RECIPES.

Rolls, Rusk, Etc.

HOME-MADE ROLLS.

Put two quarts of sifted flour into a deep dish, rub a half tablespoonful each of butter and lard into the flour, make a well in the center and pour in a pint of cold, boiled milk, stir in enough flour to make a thin batter, then mix in a half cup of good, home-made yeast, a half cup of sugar and a little salt. Let become light, knead down, let rise again, then mold, roll a fourth inch thick, cut into rounds with a cake cutter, put a little melted butter on one-half and lap nearly over on the other. Place on the pan nearly an inch apart.

RUSK.

Two cups of dough, one tea cup of sugar, half a cup of butter, two well-beaten eggs, flour enough to make a stiff dough. Set to rise and when light make into high and rather narrow biscuit. When again light sift sugar and cinnamon over the top and bake.

GRAHAM GEMS.

Beat up an egg, put with it a quart of buttermilk, make a stiff batter with Graham flour, add a little salt and a heaping teaspoonful of soda. Have the gem-pan hot and greased, put the batter in and bake in a quick oven half an hour.

RAISED WAFFLES.

A quart of sifted flour, a pint of new, lukewarm milk, two thoroughly beaten eggs, a tablespoonful of melted butter, a teaspoonful of salt, and a half teacupful of home-made yeast. Let get very light and bake in a hot, greased waffle-iron.

Cakes.

ICE-CREAM CAKE NO. 1.

Two cups of sugar, one of butter, whites of eight eggs, a fourth cup of sweet milk, three and a fourth cups of sifted flour, two teaspoonfuls of baking powder, flavor and bake in jelly tins. Boil two cups of powdered sugar in a half teacup of water stirring constantly. When thick and clear, pour boiling hot over the whipped whites of two eggs. Beat until almost cold. Flavor and spread between the layers.

ICE-CREAM CAKE NO. 2.

Make good sponge-cake, bake half an inch thick in jelly pans and let get cold. Whip a pint of thick, sweet cream, until it looks like ice cream, sweeten and flavor with vanilla. Blanch and chop a pound of almonds, stir into the cream and spread very thick between the cakes.

CREAM ROSE CAKE.

Cream three cups of powdered sugar with a cup of butter, add a small cup of sweet cream, beat five minutes, flavor with vanilla, add by degrees the whites of 10 eggs beaten stiff, and four and three-quarter cups of sifted flour with two teaspoonfuls of baking powder sifted with it. Color pink with cochineal and bake in four jelly-cake tins. The cochineal can be had of any druggist, who will prepare it for you when told for what it is wanted. He will give it to you either in liquid form when a very few drops will answer, or as a powder and you can add to a pinch of it a few drops of water. Strain and stir in drop by drop until you have the right color. For the

CREAM.

Pare and grate one cocoanut, whip stiff the whites of four eggs, stir in a cup and half of powdered sugar and flavor with rose-water. Put the cake together with this cream and stir a little more sugar into that you spread over the top.

Puddings.

PLAIN STEAMED PUDDING.

Two cupfuls of sour milk with *some* cream in it, three cupfuls of sifted flour, one-half cupful of finely chopped suet, a little salt and a large teaspoonful of soda dissolved in a little hot water. Stir the milk into the flour, beat until free from lumps, add the suet and salt and at the last moment beat in the soda. Steam two hours. Eat at once with a hard sance—sugar and butter beaten together and flavored.

APPLE BAKED PUDDING.

Pare and core six tart cooking apples and place in a buttered baking dish. Pour over the following batter: a pint of milk, two beaten eggs, a little salt, two teaspoonfuls of baking powder sifted with flour enough to make a batter thicker than for pancakes.

DELMONICO PUDDING.

A quart of new milk, three even tablespoonfuls of corn-starch dissolved in a little cold milk, the yelks of four eggs, six tablespoonfuls of sugar. Heat the milk, add the sugar, then the starch, and last the beaten yelks. Flavor, pour into a pudding dish and bake in a slow oven (the top must not brown) 30 minutes. Have the whites beaten stiff, sweeten, flavor and spread over the pudding. Return to the oven and let it just brown.

Preserves.

PLUM PRESERVES.

Allow equal weights of sugar and plums. Add only enough water to the sugar to make a thick sirup, boil and skim. Wash the plums, prick in several places and place in a stone jar. Pour over the sirup and cover with a dish that will keep the fruit under the sirup. The next day drain off the sirup, heat, skim and again pour over the fruit. Repeat this for four days. Then place plums and sirup in the preserving kettle and boil very gently half an hour. Excellent!

QUINCE PRESERVES.

Take equal weights of quinces pared and quartered and sugar. Boil the fruit until tender in water just to cover. Carefully take out the pieces, add the sugar to the water, boil, skim, replace fruit and boil very slowly until clear. Place in jars and pour the sirup over.

Miscellaneous.

FLY POISON.

Boil one-fourth ounce of small quassia chips in a pint of water for 10 minutes, strain and sweeten.

IVY POISONING.

Bathe the affected parts freely with sweet spirits of nitre.

STAINS OF ANALINE DYES.

Wash the hands in a solution of common sodium sulphite.

MILDEW

is best removed by dipping the goods into a very weak solution of chloride of lime—a heaping teaspoonful to a quart of water. If the stains do not at once disappear, place in the sun for a few minutes, after which rinse thoroughly.

MIXTURE FOR SANDWICHES.

Chop fine cold boiled ham, tongue and chicken, mix with one pint of the mixture half a cup of melted butter, a tablespoonful of salad oil, one of mustard if liked, the yelk of an egg and a dash of pepper.

News of the Week.

HOME NEWS.

MONDAY, Oct. 3, 1881.

Swarthmore College was burned on the 26th ult. Damage estimated at $300,000. The fire originated from an explosion of chemicals in the physical laboratory. The Trustees on the 27th ult. decided to continue the session in the Chestnut Grove House at Media, Pa. They also decided to rebuild the college as soon as the losses are adjusted with the insurance companies.

The Presidential mourning decorations on the public buildings alone in Brooklyn, N. Y. cost $10,000.

At Council Bluffs, Iowa, a carload of gunpowder exploded recently, shaking the city to its center and demolishing the Rock Island railroad round house, repair shops, freight house and fifty freight cars. The explosion dug a hole in the ground 15 feet deep and 45 in diameter. Large windows in all parts of the city were shattered and the plaster torn from the houses. Windows were broken in Omaha, on the opposite side of the river, and up the Missouri Valley, 20 miles north. The loss will reach hundreds of thousands of dollars. It is reported that the car in front of the car containing the explosives was set on fire by a passing locomotive. This in turn ignited the next car and the explosion followed.

General Robert Patterson, of Philadelphia, left an estate of $970,333, of which $186 covers the value of the books in his family residence and $1,772 his choice wines.

The Chinese Educational Commission Home established in Hartford, Ct., several years ago, finally closed its doors on the 26th inst. The last party of students, 27 in number, have started for China, in charge of Commissioner Wood and one of the teachers and servants. The fine building, erected there by the Chinese government two years ago, will be sold. Mr. Yung Wing, attached to the Chinese Legation and who has fostered this educational enterprise since its inception, remains in this country for the present, but it is expected will return to China next Winter, after the arrival at Washington of the Chinese Minister who has been recently appointed.

Recent reductions on three notorious star routes in Oregon will save the government about $120,000 yearly. Let the good work go on.

At noon on the 29th ult. all the sub-committees of the Committee of Twenty-eight, engaged upon the consideration of the World's Fair project, met at the rooms of the Boston Board of Trade. Reports upon the site, expenses and income, co-operation of other New England cities, management and result of the Philadelphia Exposition and permanent organization were presented and carefully considered, but no decision was reached which can be given to the public at present. Two weeks will be taken for the consideration of these reports and all possible information as to the popular support will be gathered by the committee. In two weeks the Committee of 28 will meet again, and a final decision will be reached as to the expediency of holding a World's Fair.

A wind and rain storm in Guthrie, Green and Kossuth Counties, Iowa, has inflicted serious damage. Half a dozen farm houses in Guthrie were blown over, and several persons seriously injured. In Guthrie Center several business blocks were unroofed and residences moved from their foundations. The Baptist church and other buildings were damaged. A train on the Fort Dodge road was blown from the track near Ripley. Three cars were demolished and eight persons injured, two seriously.

The programme of the ceremonies at the opening of the Atlanta Exposition, on Wednesday, October 5, has been completed. The ceremonies will be exceedingly impressive. Many representative citizens from every part of the United States have accepted invitations to participate. Most of the buildings are finished and exhibitors are rapidly putting their displays in shape. The city is fast filling with visitors. Thursday, October 27, has been decided upon as Governors' Day and all the State Executives are expected, at the conclusion of the Yorktown celebration, to visit the Exposition before returning to their homes. The 1st Connecticut Regiment and other military organizations are expected to take part in the exercises of that occasion.

Typho-malarial fever, bilious colic and pneumonia are playing sad havoc among the persons rendered homeless by the recent forest fires. Many deaths have already occurred, and several of the sufferers are now lying at the point of death.

G. A. Zahn, a farmer living near Baton Rouge, La., while watching a corn-field with a gun, shot and killed Hardy Price, whom he saw stealing corn. Zahn surrendered and was acquitted by the coroner.

The depot at Irvington Station, a few miles north of Fort Dodge, Iowa, was struck by lightning on Thursday, prostrating 18 men. The first one to recover, finding the others apparently dead, dragged them out into the air. All recovered except one. Some had their clothing torn entirely from their bodies. The building was nearly destroyed. Mechanics' tools were strewn in all directions, as if there had been a powder explosion.

California papers print a report that 35 families from the Oneida Community, New York, have purchased lands near Santa Anna, Cal.

The order detailing a court-martial to try Sergeant Mason, who attempted to shoot Guiteau, will be suspended for the present by order of Gen. Hancock.

On an average, $200,000 in gold coin, bullion or jewelry is sent every day as third-class mail matter through the San Francisco Post Office. Half of this is shipped by the Government; the rest is private remittances.

The forest fires which lately devastated Eastern Michigan were not without compensation. While they destroyed many human lives and much valuable property, they also swept clean of brush and scrub growth thousands of acres of good soil, which would otherwise have remained a wilderness, but which is now ready for cultivation. Poor consolation!

Several memorials of the late President are about to be established. At Long Branch a memorial window of richly stained glass is to be put in the Episcopal church; a gold medal is soon to be issued from the U. S. mint bearing on one side a medallion of Gen. Garfield, on the other, one of Lincoln; a fund to establish a Garfield Memorial Professorship at Williams College will be raised; and a monument will be erected to his memory in Cleveland.

At Spartanburg, S. C., on the 30th ult., B. W. Hicks was hanged for murdering his wife in May last. A large number of people witnessed the death scene.

The Republican State convention meets in this city on Wednesday the 5th inst. for the nomination of State officers.

A dispatch from Wautoma, Wis., says that a terrible tornado swept a valley a short distance west of that town on Thursday, completely devastating a space 80 rods wide and five or six miles in length. Many houses, barns and outbuildings, and one grist mill were demolished. About a dozen persons were seriously injured, but nobody was killed outright.

The extra session of the Senate on the 14th inst., will be called to order by the Sergeant-at-Arms, there being no clerk to perform that duty. It is generally conceded that the Democrats will elect a President *pro tem.* The newly elected Senators will then probably be admitted and participate in the further organization of the Senate. After the new Senators are sworn in, the Senate will then stand 37 to 37, besides Davis and Mahone, and the chances therefore are it will stand for organization 38 to 38, with no one to give the casting vote.

General Garfield first met Dr. Bliss when they were both young men. Garfield, when trudging to college lost his pocket-book, containing all his worldly wealth, and Bliss found it and returned it to him.

According to the request of Queen Victoria, asking of Mrs. Garfield a photograph of her late husband, the picture has been forwarded to her Majesty, by Mr. J. F. Ryder, the photographer. It is the same size as the one that hangs in catafalque, is silver tinted and elegantly framed. The photograph sent to the Queen is considered by Mrs. Garfield the best photograph ever taken of her husband.

Mr. E. G. Booth, a wealthy Philadelphian, and a native of Virginia, is erecting a handsome villa on the bluff at Yorktown, Va., at a cost of $1,000, for the use of President Arthur at the coming centennial celebration. He has also offered to erect such stands along the bluff for the benefit of prominent visitors as might be required.

It is announced that Lieut.-Gov. Tabor, of Colorado, will next Winter found an extensive public library in Denver. The building is to cost $200,000, and will open with 100,000 volumes.

Mr. Orlando B. Potter gives $2,000 toward the publication, in form suitable for public circulation, of the late President Garfield's opinions and utterances upon the importance and necessity of reform in the civil service of the country. Mr. Potter hopes that others will contribute, and names George Wm. Curtis as custodian of the fund.

The law library of the late Judge Clifford, of Maine, is valued at $30,000.

The dome for the new Observatory at West Point Military Academy, now being constructed, of paper, is expected to have scientific uses besides that of a mere covering. It will act as a non-conductor of heat and electricity, and maintain a uniform temperature within the building, thus preventing an electrical disturbance of the instruments used.

The amateur Cabinet makers are busy assisting (?) President Arthur in appointing a new Cabinet. It seems to be the general opinion that there will be a complete overhauling of the Cabinet, which is, of course, the privilege of the new President. Attorney General McVeagh has urged the President to accept his resignation before the special meeting of Congress on Oct. 14, and Secretary of the Treasury Windom wishes to vacate his position in order to become a candidate for re-election to Congress from Minnesota. George S. Boutwell of Massachusetts, is mentioned for Treasurer. Mr. Blaine will probably insist on the acceptance of his resignation at an early day, but who will be his successor is very uncertain. Hamilton Fish, of N. Y., is mentioned for the place. If any man, now a member of the Cabinet, remains there it will be Secretary of War Lincoln. However, we are not Cabinet makers.

The physicians who attended the late President are being hauled over the coals on account of their autopsy of the remains. Dr. Hamilton reviews the case in this month's Medical Gazette, and soon the whole thing will be thoroughly aired in the cientific papers. It seems that the doctors were all at sea as to the nature of the wound, and that the case was a more desperate one than they had given out.

A Washington rumor has it that ex-Governor Dingley, elected to succeed Mr. Frye, of Maine, in the House of Representatives, will decline in favor of Mr. Blaine, who, back again in his old field, won't object to his old place of Speaker.

There are strong indications that the question of a bankruptcy law will be a prominent subject before the next Congress. The Senate committee is considering the matter and has received a large number of communications bearing on the subject.

"Better Health than for Forty Years."

A patient who has been using Compound Oxygen writes: "I am enjoying better health than I have done for forty years, and I attribute my restoration entirely to the use of your Compound Oxygen. My average weight was never over 109 pounds. I now weigh 125 pounds, and have renewed vitality, and my friends say I am looking ten years younger than when I commenced the use of the Oxygen. Our Treatise on Compound Oxygen, containing large reports of cases, and full particulars, *sent free.* Drs. STARKEY & PALEN, 1109 and 1111 Girard Street, Phila. Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Oct. 3, 1881.

THE following is a condensation of agricultural news telegraphed from all the principal points in the country between noon on Friday, Sept. 30, and date: EASTERN STATES. Portland, Me.: Food products strong and active. Dairy and farm products firm, with decreased supplies, indicating much higher prices. Continued fine weather has assured an abundant harvest to corn packers and the ripening of all the crops in this section.....Boston, Mass.: Wool still firm; but sales falling off as compared with previous weeks in Sept., amounting during the week to only 2,568,850 lbs. Hides dull and weak. General business very brisk.....Providence, R. I., and Fall River, Mass.: Cotton steady and scarce: Middling uplands, 12½; middling gulfs, 12¾. MIDDLE STATES.—Buffalo, N. Y.: Suspension of grain shipments from Chicago due to the corner in October corn has demoralized lake trade. Steamers have left there for this place with corn at ½c. per bushel, entailing a loss of ¼c. on every bushel carried. Ordinary canal shipments of grain are light, at 4½c. on wheat and 4c. on corn to New York.....Philadelphia, Pa.: Wool quieter; sales, 850,000 lbs. against 1,500,000 lbs. last week; but market very strong, and outlook favorable to sellers. Cotton quiet; stock here, 4,560 bales. Grains active on speculative account: prices higher all round. Exporters are doing nothing in wheat, as prices here are above those in foreign markets; but there is a good demand for corn. On Thursday 250,000 bushels were sold for export, and prospect good for larger exports..... WESTERN STATES. Detroit, Mich.—Movement in grain light; farmers holding back against contracts for future delivery. Great danger that land in the burnt district will be sold for much less than its value owing to the great distress of the burnt-out owners. Owing to rise in prices, the laboring classes find it difficult to obtain more than bare necessaries.....Chicago, Ill.—Grain markets active, excited and higher, the result mainly of a speculative flurry during the week. Wheat has advanced 10c to 12c per bushel, sales for November delivery being made on Thursday as high as $1.44⅛. Corn has advanced, during the week, 7c per bushel, and oats 4c. The grain is now in the hands of the Chicago clique who are pushing the Cincinnati corner to the wall. In store 6,851,475 bushels of corn, and 3,330,000 bushels of wheat. All lake freights have been as low as 1c per bushel for corn to Buffalo; for grain is higher here than there, and higher in Milwaukee than here whither 20,000 bushels of corn have just been sent. Cattle receipts are unusually heavy, those of Wednesday (10,200 head) being the heaviest on record.....Peoria, Ill.—Grain receipts very good. Weather warm. Fair in progress.....Cleveland, Ohio—No. 2 red winter wheat, $1.47; corn, 75c; high mixed No. 2 oats, 51c.....Cincinnati, Ohio.—Wheat advanced steadily till Thursday, when it dropped 1½c. Corn scarce and firm. Flour ditto, with a speculative demand. Oats, rye and barley firm. Little doing in hog products.....Indianapolis, Ind.—Wheat firm and advancing rapidly. Indications with regard to corn crop are more favorable. Fair just over.....Milwaukee, Wis.—Weather has been unsettled, with more or less rain every day, causing considerable damage to unthrashed grain. Receipts of cereals still light, owing to unfavorable weather. Contrary to expectation, there has been a sharp advance of 6@8c. per bushel in wheat. Flour in good demand; local mills taxed to their fullest capacity.....St. Paul, Minn.: Poor crops in Southern Minnesota. Bad weather still demoralizing trade. .....Louisville, Ky.: Rains are improving the tobacco crop; but Kentucky yield is not expected to be over half of last year's. Leaf market stationary at last week's prices. As compared with last week's prices, lugs are ½@¾c.; dark leaf, ¾@1½c., and good cutting leaf, 1@2c. lower.....St. Louis, Mo.: Butter and cheese in small supply, of poor quality, and advancing. Provisions dull and weakening. Horses and mules are arriving now at the rate of 250 to 300 head per day and are selling nearly as fast at good figures. Several heavy general rains during the week have tended to check speculation in grain, though wheat, corn and oats are strong and buoyant.....Kansas City, Mo.: Cattle market weak—10@15c. lower. Hogs fairly active; prices firm with an advancing tendency.....SOUTHERN STATES. Baltimore, Md.—Very large dealings in grain and considerable excitement; prices higher than at any time this season. No shipments during the week, but increased inquiry for charters on Thursday and Friday, it being understood that the "shorts" in England and the Continent are becoming alarmed and are sending orders. Provisions quiet but steady with a firm and active jobbing trade. Cotton steady with a constant demand from spinners..... Richmond, Va.—Weather excessively hot all the week. Leaf tobacco is flat. Though the markets for all bright grades is firm, the dark grades have declined 75c per 100 pounds, owing to rains two weeks since in N. C. where most of the bright wrappers are grown. The outlook for leaf of good quality is very gloomy, while in Virginia the dark crop will be considerably better than was at one time expected. Grain receipts light.....Wilmington, N. C.—Weather hot. Cotton, grain and turpentine crop reports still unfavorable. A British steamer of 1,500 tons, the largest here for years, is loading with cotton..... Charleston, S. C.—Cotton continues to come in slowly; receipts for the week, 15,888 bales, against 32,015 for corresponding week last year. Rice comes in slowly and all prices are up. Rainfall this week 0.31 inch against 1.72 inch last week.....Savannah, Ga.—Weather hot and dry. Cotton market weakened to a basis of 11⅛c@11c, owing to large sales by two "bull" houses. A light stock of rice on hand; good demand and full rates.....Rainfall, 0.20 inch against 2.17 inches last week.....Augusta, Ga.—All kinds of produce, meats, breadstuffs, etc., have advanced, and have a firm upward tendency. Cotton coming in rapidly; receipts since September 1, 22,000 bales against 32,088 at same date last year. Weather still favorable for picking, and farmers are busy gathering crop. In some places the fields are white with cotton—not sufficient labor to pick it, but generally labor is plentiful and efficient..... .....Atlanta, Ga.—Cotton crop generally short. Rainfall 0.53 inch against 0.63 inch last week .....New Orleans, La.—Cotton strong; prices advanced and operations large. Since Thursday-all grades are marked up—low ordinary from 7c to 7⅞c; good ordinary from 9¾c to 10⅛c; middling from 10¼c to 11⅜c, fair firm 12¼c to 12⅜c. Grain active and easier. Heavy rains through this and adjacent States will benefit Fall crops, particularly cane. General estimate of sugar crop 25 per cent. less than last year..... Memphis, Tenn.: Flour higher. Weather favorable for cotton picking, which is progressing rapidly. Labor plentiful and good; receipts greatly over those of last year. Average weight per bale is found to be 30 pounds less than the average weight of bales marked during same season last year. Rainfall, 0.72 inch, against 0.02 inch last week.....Nashville, Tenn.: Wheat slow in movement; sup-

ply light. Corn firm with an upward tendency. Peanuts quiet but very firm. Dealers say receipts of crop will not exceed 5,000 bushels. Cotton quiet and lower. Receipts double those of former years, owing to early ripening; the whole amount to be handled here is expected to be 25 per cent. less than last year.....

The Signal Office at Washington telegraphed here on Friday evening that the average rainfall during the previous week at its 25 stations in the Cotton Belt was 0.77 inch against 1.58 inch for the corresponding week last year .....CANADA—Quebec: Wool very firm. Dairy products have ruled dull, and close with an easy tendency. Grain trade active, and prices of wheat and coarser grains are higher. .....TORONTO—The Grand Trunk Railroad authorities, in their annual crop report, say that along their line in Canada, hay, maize and fruits of all kinds have proved failures this year; but, taken altogether, the harvest has proved a very satisfactory one, wheat, oats and barley each exceeding an average crop.

The British Board of Customs is endeavoring to prevent the introduction of the Colorado beetle into England. A fright has been caused by the rumor that Irishmen in the West were gathering potato beetles and securing them in small boxes for transportation to England.....A special from Union City, Tenn., says squirrels are crossing the Mississippi River, 50 miles south of Hickman, in fabulous numbers. They are caught by the dozens by men in skiffs. They enter and pass through corn-fields, destroying as they go. They are bearing up the country, and hundreds are seen crossing east over the Tennessee River, below Point Macon. They are from the interior of Arkansas..... Pink-eye is the name of a horse disease—said to be new—that is spreading disastrously at Chicago. Nearly every stable in the city is said to be suffering from its ravages. It has also visited St. Louis, where it is doing a great deal of damage. A few cases are reported in this city, but there is some doubt as to whether ours is the real "pink-eye," which gets its name from the color assumed by the eye in affected animals. It has doubtless appeared widely in smaller Western towns, villages and country places, of which the telegraph makes no mention.....A telegram from Quebec on Sept. 27, says: During the last few days a number of horses and calves have succumbed to a strange disease, supposed by veterinary surgeons to be a species of blood poisoning. A man who skinned one of the dead calves died himself the next day—probably some form of malignant anthrax.....

The census puts the total consumption of cotton in all branches of textile manufacture during the year ending August 31, 1880, at 1,736,326 bales, of which the Northern mills took 1,539,722 bales and the Southern mills 196,604 bales. Compare this with the Editorial Brevity in our last issue, and allow for the increase during the year, and it will seem that the Financial Chronicle's *estimate* for the year ending September 1, 1881, must be very close indeed to correctness.....Here is Bradstreet's estimate of the condition of the growing cotton crop:—

Per cent. of acreage in each State on which the crop is better, equal to or worse than at corresponding time last year.

	Better, per ct.	Equal, per ct.	Worse, per ct.
North Carolina and Virginia	1	1⅛	97⅛
South Carolina	0	0	100
Georgia and Florida	0	5⅛	94⅛
Alabama	5½	7½	87
Mississippi	5½	6⅛	88
Louisiana	9	0	91
Texas	2⅛	6⅛	91
Arkansas	¼	¾	99
Tennessee	0	0	100
Average for cotton belt	2.8	4.3	92.9

The condition and prospect of the crop based on yield are shown more forcibly in the following table. This gives the actual average condition of the cotton crop, as compared with that of last year at the same time, as indicated by the reports from each State and the average for the whole country:

	Below last year, per cent.
North Carolina and Virginia	37.9
South Carolina	39.8
Georgia and Florida	28.8
Alabama	21.7
Mississippi	28.6
Louisiana	30.6
Texas	39.1
Arkansas	51.8
Tennessee	46.2
Average for cotton belt	31.5

Bradstreet's reports show that it takes 3½ pounds of seed to give one pound of lint in Mississippi and Arkansas, 3⅛ pounds in North Carolina, Alabama, Louisiana, Texas and Tennessee, and 3¼ pounds in South Carolina and Georgia. This light yield also helps to reduce the crop. The reports indicate that a favorable Fall and late frost will improve the present condition and prospect of plants in each State, as follows: In North Carolina and Virginia, 2 per cent.; South Carolina, 3 per cent.; Georgia and Florida, 2.6 per cent.; Alabama, 1.2 per cent.; Mississippi, 1½ per cent.; Louisiana, 3½ per cent.; Texas, 4.4 per cent.; Arkansas, ¼ per cent., and Tenn., 2.3 per cent.

No More Nitre or Buchu.

After the sufferer from a trouble of the kidneys has been drenched with buchu, nitre and all sorts of diuretics, he or she will find a certain cure in Kidney-Wort. It is tonic and purifying in its action, and always effectual.—Journal of Education.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

Thousands of ladies have found sudden relief from all their woes by the use of Lydia E. Pinkham's Vegetable Compound, the great remedy for diseases peculiar to females. Send to Mrs. Lydia E. Pinkham, 233 Western Ave., Lynn, Mass., for pamphlets.

BURNETT'S COCOAINE

Will Save the Hair,

And keep it in a strong and healthy condition, because it will stimulate the roots of the hair, and restore the natural action upon which its growth depends.

Burnett's Flavoring Extracts are absolutely pure.

The Markets.

SPECIALS FROM THE CHIEF CENTERS

Until Saturday, October 1.

CHICAGO.—WHEAT strong and higher; No. 2 red Winter at $1.41@1 42; No. Chicago Spring, $1.39½@1.40; cash, $1.39⅛; October, $1.43¾@1.43⅜; November, $1.40; December, $1.39¼, all the year. CORN strong and higher, active and firm at 74@74¼c., cash; 74⅛@74¼c.; October; 73⅝@74c., November; 72c. December; 76⅛c. May; sales at 73⅝@74⅜c. October; 73⅝@74¼c. November; 75¼@76¾c. May. OATS moderately active and higher at 45¾c., cash; 45¼@45⅝c. October; 45⅞@46c. November; 46½c, December; 45½c. all the year. BARLEY, $1.10½@1.11. FLAXSEED firmer at $1.42@1.43½. PORK active and a shade higher at $19 cash; $18.90@18.92½ October; $19.20@19.22½, November; $20.60, January. Lard fairly active and a shade higher at $12.15 cash; $12.17½@12.20, October; $12,35@12.37½ November, $12.50, December; $12.80@12.82½, January. Bulkmeats easier; shoulders, 8c.; short rib. 10¼c.; short clear $10.85. HOGS—market quiet and weaker and 5@10c. lower than on Friday; very poor quality; mixed packing $6.20@6.65; choice heavy packing and shipping $6.75@7.30; light or bacon $6.30@6.75; culls and grassers $3.90@6; Western hogs freely offered, but slow at $5.50. CATTLE—total receipts for the week 40,800 head—the largest on record; exports scarce and in good demand; selling at $6.20@6.90; good to choice shipping, $5.50@6; common to medium and grassy natives weak at $3.70@5.20; butchers' weak at $2.20@4.50; stockers and feeders more active, but quite low at $2.50@3.75; Texans $2.75@3.05; half breeds and natives $3.60@4.50. SHEEP—offerings mostly inferior; thin sheep $2.50@3.50; fair to good $3.25@3.75; choice $4@4.40.

CINCINNATI, Ohio.—WHEAT firmer; No. 2 red Winter, $1.49. CORN stronger; No. 2 mixed, 73½c. OATS strong; No. 2 mixed, 45½c. RYE stronger at $1.16. PORK nominally unchanged at $21. Lard firm. Bulkmeats dull and nominal; shoulders, 8¾c.; clear rib, 10¾c. Bacon steady; shoulders, 9½c.; clear rib, 11¾c.; clear sides, 12¼c. BUTTER—Fancy creamery sells at 38c.; prime do. at 36@37c.; choice dairy at 30c.; prime to choice Western Reserve at 28@30c.; medium do. at 23@25c.; prime to choice Central Ohio at 20@23c., and common at 15@18c. per lb. CHEESE.—The market has been strong all the week and some choice mild factory is arriving which is selling at 14@14¼c. per lb.; prime but rather sharp do. sells at 12½@13½c.

ST. LOUIS.—WHEAT excited and higher, but unsettled; No. 2 red Fall, $1.47¼ cash; $1.47 October; $1.52¼ November; $1.55⅛ December; $1.58¼ January; No. 3 do. $1.37½; No. 4 do. $1.29 bid. CORN excited and higher at 66½c. cash; 66⅜c. October; 70c. November; 71⅛c. December; 72⅛c. January; 78c. May. OATS higher at 46c. cash; 46¼c. October; 48½c. November; 49¼c. December. RYE higher at $1.12¾@1.13.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 1, 1881.

BEANS AND PEAS.—Receipts of beans are large but with the crops admitted to be moderate sellers keep adding on to prices and a free demand supports them. Marrows are selling for home use as well as for export, their usual outlet. No new red kidney showing yet, they would bring $2.75 if choice; old, $2. Green peas range at $1.90@2.15 for Wisconsin, the latter for new. Southern B. E. selling in a small way at $3.5 per 2-bu. bag.

Marrow beans, new, $3.45; mediums, $3.35@3.40; peas, $3.35@3.40; white kidney, $3.25@3.40; black or turtle soup, $2.

Receipts of beans for the week, 18,712 bush.

Exports do. 317 bbls.

BEESWAX—Dull at 21@22c., the latter for Southern.

BUTTER.—There is a strong market for high grades of table stock, as they are scarce. Other styles of State are quoted well up, but trade is stock, as quotations have struck a point that reduces consumption especially as all other good items are high. Western fresh sells upon arrival; held lots are mostly nominal; they cannot be placed here and shippers do not seem to be in urgent want of the cheaper grades; choice butter is out of the reach of exporters.

Creamery, finest tubs, 35@36c.; good to prime, 32@34c.; other quality, 24@26c.; sweet cream, 28@31c.; State dairy do. 23@26c.; do. half tubs, choice, 33c.; do. fair to prime, 25@29c.; Welsh tubs, 25@29c.; poor State, 20@25c.; Western imitation creamery, 20@27c.; do. dairy, choice, 24@25c.; other, 17@22c.; factory or ladle-packed June and Iowa, 18@19c.; other, 15@17½c.; common Western, 15c.

Receipts for the week, 19,867 pkgs.

Exports do. 1,363 do.

Cold storage to G. B., 90s.

CHEESE.—The week has ruled very quiet. Most of the stock has been regarded off in quality on account of the severe weather and fine desirable lines of factory are held above shippers' views. Fine August is quoted at 13c, and a few September have made 13¼c. The lines that exporters have worked moderately in have been useful sorts at 11½@12c. Home trade fair; skims have a good share of the trade at low prices.

State factory, fine, 12¾@13c.; good to prime, 12@12¼c.; fair to good, 11@12c.; poor to fair, 10@11c; Ohio factory, cheddar, fine 11¾@12c.; fair to prime, 10½@11¾c.; factory, flat, fine mild, 12¼@13¾c.; good to prime, 11@12c.; fair to good, 10@11c.; creamery, partly skimmed, 4@11c.; fully skimmed, 1@3c.; full-skimmed factory, 1@3c.

Receipts for the week, 52,435 bxs.

Exports do. 33,473 do.

Liverpool cable, 61s.

Steam to Liverpool, 16s. 3d.@20s.

COTTON.—In a speculative way the market has alternately shifted ¼c. New crop begins to arrive in quantities and there is not likely to be any extra heavy trade in spot until stocks are in better form of estimation.

DRIED FRUITS.—Evaporated apples scarce and higher. Sun-dried steady and firm; peaches scarce; small fruits quiet but firm.

Apples, evaporated, new, 11@12c.; do. old, rings, choice, 15c.; do. fair to prime, 10½@11½c.; N. C. new, sliced, extra fancy, 8½@9c.; choice, 7½@8c.; fair to good, 6½@7c.; Southern, new quarters, choice, 6@7c.; fair to prime, 5¾@6c.; inferior, 5@5½c.; State, old, fine-cut, choice, 6½@7c.; quarters, do. 5¼@6½c.; small lots, 6½c.; Ohio and Mich. choice, 6@6¾c.; Western, fair to good, 5¾@6c. Peaches, evaporated, peeled, 1880, 33c.; unpeeled, 26c.; N. C. peeled, new, fancy, 23@24c.; choice, 22@23c.; Ga. peeled, choice, 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 9@9½c.; halves, Tenn. 9c. Plums, State, black, 17c.; Southern Damson, 11½@15c. Blackberries, 13@13½c. Cherries, Southern, dry, 19@20c. Raspberries, 28c. Huckleberries, 15c.

EGGS.—Receipts for the week, 7,357 bbls.; do. last week, 8,800 do. Hot weather has caused a pressure to sell, but with prospective light receipts prices are named strong. A good many losses are noted in count for the week; in Western only choice Mich. and Ohio make the extreme.

Near polnts, 25c.; State and Pa. 22@23c.; Canadian, 21½c.; Western, fresh, 21½@22c.. other useful sorts, 20@21c.

FLOUR.—Prices have advanced 40@50c. ₱ bbl on all the attractive grades, and regardless of the stiff figures there has been an active demand for home and export purposes.

No. 2, $4.00@5.25; State and Western, superfine, $5.65@6.25; city mills, extra, $7.00@7.85; Spring wheat, extra, $6.50@6.90; Spring XX and XXX, $7@8; patents, $8@9.50; Ohio round hoop shipping, $6.00@7.50; trade brands, $7.25@7.75; St. Louis extra, $6.75@7.25; do. double extra, $7.40@7.85; do. family, $8@8.25; Southern extra shipping, $7@7.50; do. XX and family, $7.75@8.50. Rye flour, superfine, $6@6.90. Corn-meal, Brandywine, $3.85@4; do. Western, $3.60@3.90.

Receipts of flour for the week, 99,400 bbls.; corn-meal 2,050 do.

Exports of flour for the week, 51,525 bbls.; corn-meal 3,375 do.

FRESH FRUITS.—Apples are of irregular quality and a lot must be straight and of right shipping order to make the extreme. Exporters took last week 5,100 bbls. Pears are abundant and as a rule easy as a good many varieties are here. During the glut many Bartletts were put into cold storage; they turn out badly as they meet almost as hot weather now as when they were put away. The remnant of peaches are winding up high. Recent arrivals of grapes have turned out poor and have often sold at a loss. Plums almost out. Cranberries are lower as supplies have accumulated. First class picklngs, however, are not yet here. A few Western orders have been filled at $7.

Apples, Western New York, prime mixed lots, ₱ bbl. $1.75@2; fair do. $1.25@2.50. Sweet, 50c.@$1; Gravenstein, $2.50@2.75; 20-oz. $2.25@2.50; Maiden Blush, $2.25@2.50; Fall Pippin, $2@2.25; Baldwin, Jersey, ₱ 4-h. bbl. $1.50@2; Greening, do. $1.50@2. Baldwin, Jersey, bulk per bbl. $1@1.25. Pears, Bartlett, ice-house, prime ₱ bbl. $3.50@5.50; prime to good $3@5; rime, ₱ keg, $2.50@3; do. inferior, $1.50@1.75; Boston, ₱ bush. box, $2@3.50; Louise Bonne, ₱ bbl. $2@2.50; Sheldon, $2@3; Beurre Rose, $2.50@3; Duchess, $2@2.25; Virgalieu, $2@3; Beurre d'Anjou, $2.50@3; Seckle, choice, $3.50; fair to good, $2@3; Swan's Orange, $2@2.50; cooking, $1.50@2. Peaches, New Jersey and up-river select, fancy, ₱ bskt, $2.50@3.50; choice lines, $1.75@2; fair $1.25@1.50; common, $1@1.25; culls, 62@75c. Plums, Copper, ₱ crate $1.75@2; Damson, ₱ ½ bush. crate, $1.25. Grapes, Del., State, case of 12 ℔ bxs, $1@1.75; bskts, choice, ₱ ℔, 7@8c.; poor to fair, 4@5c.; Catawba, State, bskts, ₱ ℔, 4@5c.; Concord, State, case 18 ℔ bxs, $1.75@2; do. in bskt, ₱ ℔, 2@3½c.; up-river, loose, ₱ ℔, 2@3c. Cranberries, Cape Cod, choice, ₱ bbl. $7; do. fair to good, $5.50@6.50; do. poor to fair, $4@5; ₱ crate, $1.50@2.37; Eastern, round hoop barrels $4@5; Jersey, prime, ₱ crate, $1.50@1.75; do. poor to fair, $1@1.25. Watermelons, Maryland, ₱ 100, $12@15; Jersey, Black Spanish, $12@15; culls, $3@5.

Peanuts quiet and about steady as quoted. The crop of 1881 is estimated at about one-half the average yield. Hickory nuts are in fair supply and very dull; good lots of new offered in a wholesale way at $1.75 without selling; a few small sales of choice reported a shade higher. Chestnuts in light supply; any considerable quantity could not be placed at present extreme prices.

Peanuts, Va., hand-picked, ₱ ℔, 7¼@7½c.; fancy, 6½@7c., extra prime, 6¾@6¾c.; good to prime, 5½@6¼c.; shelled, screened, 6@6½c.; shelled, unscreened, 5½@6c; pecan nuts, ₱ ℔ 8@11c.; hickory nuts, shell-bark, ₱ bu. $1.75.

GRAIN.—A strong speculative want has shown every day since our last for wheat and firm prices are ruling for spot and future dealings. It has been more than an excited market, because a wholesome high-price tone has run the list of other grains, with actual operations.

Wheat, Spring, $1.20@1.47; Spring No. 2, $1.44@1.46¼; red Winter No. 2, $1.53@1.53¾; red Winter, $1.40@1.55; white Western and State, $1.40@1.52. Rye, $1.05@1.10. Oats, white No. 1, 53½c.; No. 2, 52½@52¾c.; No. 3, 51c.; mixed, No. 1 46c.; No. 2, 45½@46c.; No. 3, 42@44c. Corn, Western mixed, 70@76½c.; No. 2, 75@76c.; yellow, 75@80c.; white, 80@90c. Barley, Canada, No. 1, $1.15@1.20; do. bright, $1.20@1.25.

Receipts for the week, wheat, 862,170 bush.; corn, 1,558,385 do.; oats, 253,000 do.; rye, 15,050 do.; malt, 70,200 do.; barley, 29,500 do.

Exports for the week, wheat, 1,081,087 bush.; corn, 515,716 do.; oats, 35,651 do.

HAY AND STRAW.—Exports for the week, 1,780 bales. Since Jan. '81, 62,400; do. '80, 90,050 do. The market is weaker for hay, as supplies are larger. Quality as a rule unattractive.

Prime Timothy hay, ₱ 100 ℔s., $1.05@1.10; medium Timothy, 90@95c.; shipping grades, 70@75c.; clover mixed, 75@85c.; clover 65@70c.; Straw, long rye, 70@75c.; short rye, 45@55c. oat and wheat straw, 30@40c.

HONEY—Offering at 17½@18c. white clover comb, choice; 14@16c. fair to good; 13@14c. buckwheat.

HOPS.—Receipts of new are larger; most lots coming to dealers who have recently bought them in the State. We see few lots coming on commission. Brewers still buy sparingly, seldom bidding above 30c. for any samples. Exporters make few inquiries in this market. The tone, however, is stronger under advices of free transactions in the interior and reports and bids have been made there above recent prices. Some parties claim that such higher bids have been made to stimulate the views of country holders and give dealers an opportunity to sell their early purchases at a profit. Exporters continue to send over a few lots recently bought in the interior. Yearlings are in small supply, good demand and firm.

Crop of 1881, choice, 22@23c.; good to prime, 20@21c.; fair to good 18@20c.; 1880, choice, 19@20c.; fair to prime, 14@18c.; poor to fair, 10@14c.; eastern, 10@15c.; 1879 fair to prime, 12@14c.

Receipts for week, 3,023 bales.

Exports for the week, 554 do.

MILK.—The average price of commission milk was $2.43, the range being $2@3. Sweet milk is scarce and sells readily. Farmers still complain of poor cooling facilities.

POULTRY AND GAME.—There is an easy feeling in dressed poultry, the weather is adverse to trade.

Turkeys, Phila. prime, 15@16c.; State and Western dry-picked, 14@15c.; scalded, 13@14c.; young turkeys, 11@13c. Chickens, Phila. 18@19c.; Bucks Co. 17@18c.; Jersey, 16@18c.; State, 16@17c.; Western, 15@16c. Fowls, Phila. dry-picked, 16@17c.; Bucks Co. 15@16c.; Jersey, dry-picked, prime, 15@16c.; do. scalded, 14@15c.; State and Western, dry-picked, prime, 15@16c; scalded, prime, 14@15c.; inferior, 12@13c. Ducks, Spring, Phila. ₱ ℔, 18@20c.; Jersey and Bucks Co. 16@18c.; State, 15@16c.; mixed State, 14@15c.; old, fair to good, 12@14c. Squabs, white, ₱ doz. $2.75@3; dark, $1.75@2.

Live is in good demand at satisfactory prices.

Chickens, New Jersey, ₱ ℔. 15@16c.; State and Penn. 15c.; Western, 13@14c.; Southern, 13@14c.; Fowls, Jersey, State & Penn. 15@16c.; Western, 13@14c.; Southern, 13@14c. Roosters, old, 6@7c. Turkeys, Jersey and Penn. 13@14c.; Western, 13c. Ducks, Jersey, extra-large, ₱ pair, 87c.@$1; Jersey, New York and Penn. 60@75c.; Western, 50@60c.; Southern, 50@55c. Geese, Jersey, N. Y. and Penn. $1.50@1.75; Western mixed and Southern, 75c@$1.37. Pigeons, full-grown, 25@30c.; young, 20@25c.

Prime partridges scarce and firm; few sales reported; prime grouse steady. Soft grouse and partridges have sold at very irregular and low prices and there have been a good many of them. Some lots of grouse have been too far gone to sell at any price. Woodcock are scarce and firm. Fresh English snipe and plover sell at about $1.50 per doz. Grass plover were there any, would sell a good deal above quotation for ordinary plover. Ice house snipe and plover are unsalable. Some lots of western ducks have arrived and sold at 75c. for Mallard and Redhead, 40c. for Teal and Wood and 30c. for common ₱ pair. Reedbirds are quoted at $1 and blackbirds at 20@30c. ₱ doz. Venison in fair request and firm when in good order; supply small.

Grouse, choice, 80@85c.; soft, 20@40c.; partridges, prime, $1.50; soft, 50@75c.; woodcock, choice $1.12@1.25; inferior 70@80c.; English snipe and plover, fresh-killed, $1.25@1.50; venison, Minn. short saddles, 18@20c.; Western, 16@18c.

PROVISIONS.—The market is active and strong and prices for all hog products seem well set. Exporters are making liberal purchases, as it seems useless to hold off for a more favorable early turn, in the present aspect of the situation.

Pork, extra prime, ₱ bbl. $13@13.50; Western mess, new, $19.50@20. Lard, steam Western, ₱ 100 ℔s., $12.45@12.50; prime city, $12.40. Hams, smoked city, ₱ ℔. 13½@14c.; pickled Western and city, 12½@13c.; Shoulders, smoked city, 9¼@9½c.; pickled, 8½c. Rib bellies, pickled, 10½@11½c. Bacon, long clear and Western 10¾c. Beef, Western mess, ₱ bbl. $12@13; packet, $13@14; India mess, ₱ tce. $21.50@23.50. Beef hams, ₱ bbl., $22@23.

Receipts for the week—Beef, bbls. and tcs. 1,108; pork, bbls 1,156; cut-meats, pkgs. 21,350; lard, do. 8,460.

Exports for the week—Beef, bbls. and tcs. 2,525; pork bbls. 2,858; cut-meats, ℔s. 4,232,733; lard do. 4,319,043.

SEEDS.—Clover is very dull. Timothy firm. Rough flax-seed nominal; held at $1.47½@1.50, without sales bbls about $1.40@1.45.

Clover, Western, 1880, car lots on track, 9¾@10c Timothy, job lots in store, $2.90@3.25.

Receipts for the week, 5,950 bush.

TOBACCO.—Seed leaf still active, but the movement smaller than last week.

Crop of 1880, 12½@21½c. for Pa. assorted; 14@50c. for New England; 14@18c. for State flats; 5@15c. for Wis. and 6½@11c. for Ohio; Ky. dull and weak at 6½@7½c. for lugs and 7¾@15c. for leaf.

VEGETABLES.—Exports of potatoes for week, 3,200 bbls. The demand is active for choice potatoes; many lots of State are running poor. Havana is calling for good qualities and the call helps to stiffen prices.

Potatoes—Early Rose, Eastern, ₱ bbl., $2.50@3; L. I. $2,62@2.75; State, $2.25@2.50; Snowflake, State, $2@2.50; Burbank, State, $2@2.50; do. L. I. $2.62@2.75; Peerless, State, $2@2.25; sweet potatoes, Va. yellow, $2.50@2.75; Del. River, $2.75@3.

Quite an extra growth of cucumbers has been secured and they are dull. Onions held with more firmness. Prime garden truck is generally firm.

Sweet corn, ₱ 100, 75c.@$1; wax beans, L. I., ₱ bag, $1; string beans, 75c.@$1; Lima beans, potato, $3@3.25; flat, $2.50@2.75; cucumbers, ₱ 100, 75c.@$1; pickles, ₱ 1,000, $1.50@2.50; egg plant, ₱ 100, $5; tomatoes, ₱ bush., 40@55c.; squash, Marrow, ₱ bbl., $1.50; cabbage, red and other, ₱ 100, $6@9; beets, L. I., ₱ bbl., $1.25@1.50; white onions, $2.25@2.50; yellow, $2.25; red, $2@2.12; Chester, $2@2.12; carrots, $1.25@1.50; turnips, Russia, $2@2.25; pumpkins, ₱ 100, $5@7; cauliflower, 75c.@2.50.

WOOL.—Trade opens slowly, but the feeling is firm and in some grades there is a possibility of advanced prices. California and Texas Fall clip will soon appear; they have opened at home at comparatively high figures.

LIVE STOCK MARKETS.

NEW YORK, Saturday, Oct. 1, 1881.

BEEVES.—Receipts for the week, 13,571 head; do. last week, 14,248 do. An important Jewish holiday occurs on Monday, and as many important buyers would not then be present, there has been active trading all the week. Sellers were very anxious to close out yesterday and liberal concessions were made, but without resulting in a clearance. Eight car-loads of Texans held over since last Monday were sold at 5c. to dress 54@55 ℔s; 12 car-loads of fresh arrivals at 7@7¼c.; a few selected out of a 16 car load brought 7¾@8c.; 13 cars of Colorado Texans changed hands at 7¾c. and upward of 30 car-loads of Colorados at 7¾@8¼c. to dress 55 ℔s.; some poor scallawags from Buffalo sold at 3@3½c. live weight. Two cars of prime Kentucky steers brought 11¾@12c, respectively, and 33 head of 1,515 ℔s average sold up to 12¼c. to dress 57 ℔s. State grass-fed bulls have declined ½c. during the week, and are hard to sell in car lots at over 2½c. live weight.

MILCH COWS.—There is a good demand for the light receipts; sales mainly at $35@55; a few extra $60@65.

VEAL CALVES—Scarce and firm; top made readily.

Live calves, prime N. J., 9c.; do. State, 8½@9c.; poor to good, 7@8½c.; Mount Hollys, 7@9c.; buttermilks, 4½@5½c.; grassers, 2½@3¼c.

SHEEP AND LAMBS.—Receipts for the week, 30,574 head; do. last week, 37,811 do. Sheep were rather dull and barely steady at the close. The supply of lambs was just about equal to the demand and sales were quick at stronger prices for prime stock. The few sales of sheep took the wide range of 3¾@5¾c. Lambs sold down to 5c. for culls and up to 7c. for choice, but 6¾@6¾c. covers most of the transaction.

SWINE.—Receipts for the week, 27,043 head; do. last week, 28,267 do. Market steady at 6¾@7c. for Western corn-fed. Some common pigs held at 4c. New Jersey pork, 8½@9½c.; city dressed, 8¼@8¾c.

ASTHMA *Quickly and Permanently*

CURED

Dr. Stinson's Asthma Remedy is unequaled as a positive Alterative and Cure for **Asthma and Dyspepsia,** and all their attendant evils. It does not merely afford temporary relief, but is a permanent cure. Mrs. B. F. Lee, of Belmore, O., says of it: "*I am surprised at the speedy effects of your remedy. It is the first medicine in six years that has loosened my cough and made expectoration easy. I now sleep all night without coughing.*" If your druggist does not keep it, send for treatise and testimonials to

THE HORTICULTURAL CLUB.

FIRST DISCUSSION.

Topic: Grapes—Their Culture, Best Varieties, etc

AT the first regular meeting of the club for discussion, Uncle Mark was chosen chairman, with but one dissenting voice, viz; his own. On taking the chair he kindly thanked the Cousins for the honor conferred, and announced the topic for discussion. He remarked that grape growing depended so much on soil and climate that it was impossible almost to consider any one variety as adapted to general cultivation. A variety that would thrive well and prove prolific in Minnesota was likely to be a failure in the South. It is an error to suppose that the vine will thrive and bear fruit anywhere, cultivated or not cultivated. It may grow, but if the soil be thoroughly worked, it will repay one for his extra labor. As to varieties the chairman considered the Wilder, Delaware, Elvira and Massasoit as good to cultivate in this latitude.

Willie Marston said that the Goethe is a favorite and if well pruned and not allowed to overbear it does exceedingly well. His father likes the Concord as it does not seem to be so easily affected with the phylloxera.

Oscar Chapman had the Concord and Malaga, as he calls it, growing in the same arbor. The latter bloomed two weeks earlier than the former and the fruit grew nicely in beautiful shaped large bunches until nearly ripe then it began to rot. He killed his vine by carelessly applying salt to its roots. He asked a remedy for the grape rot.

The chairman suggested high-trellis training in order to get freer circulation of air and better light. No sure remedy known. It is better to plant varieties not susceptible to it if possible.

Eula Chapman had some vines which became infested with insects, which were killed by an application of strong tobacco tea and potash. The Concord bears a fine crop this year.

Georgie Wilson thinks the Concord does the best of all in Florida. The Scuppernong is the most common. It has a dark copper color, a pleasant taste but rather tough skin. When a vine is ripening its fruit, a delightful aroma from it fills the air. It is said to make a good wine—four gallons to the bushel.

Henry Jacobs asked what varieties succeed best in Central New York, to which Harry French of Elmira responded that of five kinds fruited on his father's grounds the Concord stands first, being most reliable. Catawbas do not generally ripen, and growth of wood is feeble; Isabellas are apt to be frost bitten before fully ripe. Have about 40 Catawba seedlings now planted, hoping to find one at least worthy of cultivation. The Martha did not survive the last Winter.

As to a remedy for the phylloxera or grape-vine root-louse, requested by Emma Janes, the chairman stated with such varieties as the Catawba and Delaware, grafting on phylloxera-proof roots has proved beneficial.

Willie Edwards thought that the surest way to avoid phylloxera is to plant such varieties as are not subject to its ravages. The Concord, Wilder, Martha and Goethe are but little affected with the pest.

Francis Herndon thinks the Poeklington about the best white grape. The vine is a strong grower and is said to never mildew.

Ezra Morse sowed grape seeds about the middle of October; the young plants were removed to a warm building when frost came, and were covered with glass. In the Spring they were set out and have done well. Grapes should not be allowed to overbear. Thin out the blossoms on all overloaded vines and do not allow them to bear over six bunches the first year after setting. He prefers the Delaware and Concord.

The subject for the next discussion will be "Orchard fruits; their management for Winter use; packing for market; most profitable kinds, etc."

FARMING FOR BOYS AND GIRLS.

HENRY STEWART.

Oats.

OATS follow wheat in the order of value in our small-grain crop. It is a most useful grain and furnishes excellent food for man, as well as horses, cattle, sheep, pigs and poultry. It succeeds best on rich, moist soils, and 100 bushels per acre of the best varieties is sometimes grown. It will produce a fair crop, or 40 to 50 bushels per acre on poor, sandy land, and is, therefore, very generally grown, and is made a regular member of the common rotation of crops, following corn and preceding wheat. The word, oat, is derived from an Anglo-Saxon word *ate*, which means to eat, and our word eat is originally of the same meaning, or synonymous with oat. This signifies the fact that our ancestors, the Anglo-Saxons, used this grain as their chief breadstuff. The cakes which, as is related in English history, were suffered to burn by the English-Saxon king, Alfred the Great, as he was left to tend them in a hut where he had taken refuge, and for which he received a sound scolding by his hostess, were oat cakes, and no doubt the king in his temporary misfortunes, eat those cakes with as good an appetite in his humble lodgings, as he had before, and did after, in his palace.

The Latin name of the oat is *avena*. This word signifies "something desirable," and proves that this grain was highly considered by the ancient Romans, who probably introduced it into Northern Europe when they conquered and occupied it.

Oats succeed best in cool, moist climates. The best oats in the world are grown in Ireland and Scotland, where the season of growth is long and cool, and where "the rain, it raineth every day." These oats are very plump and heavy, and frequently weigh 54 or 55 pounds to the measured bushel; here, oats rarely weigh over 32 pounds to the bushel and often less than that.

There are many varieties of oats, derived chiefly from the Tartarian, Siberian, Poland, Norway and Irish potato oat. Oats are black or white, or black and white mixed. The Tartarian oat is black; the Poland and Irish potato oat are white, and very short and plump. The latter was so called from the first of its kind being found growing in a manure heap made chiefly of the stalks of potatoes. The Norway oat is black and white, or greyish, from a mixture of these colors. The Tartarian oat has a peculiar manner of growth, the panicle or head all growing on one side, from which it has taken the name of "horse-mane," or "mane" oats. The potato oat is chiefly grown where oatmeal is made, and is the best and most valuable kind grown; but it succeeds only upon rich, moist, loamy soil, while the Tartarian yields well upon light, sandy soil, and produces a fair crop where the heavier oats would fail.

Oats are usually sown upon corn stubble, early in Spring, and two and a-half bushels of seed per acre are used. It is supposed by some that oats do not require careful sowing and that the seed will grow if it is even not well covered. This is a great mistake. "What is worth doing is worth doing well," in respect to oats as to everything we have to do. The reason why the yield of oats is so small and our grain is so light is, no doubt, that sufficient pains are not taken to prepare the ground and cover the seed in a thorough manner. In all the work of the farm this truth should always be remembered—that it pays to do everything in the best manner.

Oats should be harvested before they are thoroughly ripe, otherwise the very slender and weak pedicel by which each grain hangs to the stalk gives way, and a great deal of the grain is wasted and lost. Oats should be cut as soon as the straw near the head becomes yellow, and when the grain is still so soft that it may be crushed between the finger-nails, but is yet not milky or doughy, but dry when squeezed and broken. At this period the straw is of the most value for fodder and there will be little loss of the grain. Oat straw is both nutritious and soft, and is readily eaten by horses and cattle. It is far too valuable for feeding to be used for litter.

Oats are rarely manured, as they come after corn, to which manure is usually applied. But no other crop pays better for liberal manuring or for an application of artificial fertilizer. Salt has an excellent effect upon oats when used at the rate of three to five bushels per acre; and superphosphate of lime, at the rate of 150 to 300 pounds per acre, is remarkably beneficial to this crop.

NOTE.

OUR first "Discussion" appears in another column, and it will serve to give an idea of what I want the members of the Club to do. I did not receive as many "opinions" as I expected to, but shall hope that all will be more interested in the discussions hereafter. It will do you much good to learn to express your views upon a subject, and, uniting study with experience, this ought to be a good means toward gaining increased knowledge in horticulture, etc. Now then for the next discussion, which will be published in three weeks, let *all* show their interest by dropping me a few lines on a postal card. We want short notes and such as will enable us to impart the most information one to another. Of course our meeting is rather an imaginary one, hence these discussions may be considered as reports of said meeting; but don't *all* imagine that some one else will do the writing. This is just the time to consider the subject proposed for the next meeting, and I think that most farmers' boys can write something from experience. The girls, too, should have a word to offer on so interesting a topic. Now hurrah! for the one on Orchard Fruits. U. M.

Arboricultural.

PLANTING BLACK WALNUTS.

I AM glad to see the RURAL advocating the growing of nut-bearing trees, and especially the black walnut, which is so valuable for timber. These trees are so easy to get started and grow so rapidly that no one need hesitate to make the effort. They will grow on any kind of rough land, however exposed, among the rocks, on dry knolls, or on bottom land if it is not covered with water. Our oldest black walnut trees we are confident will bear nuts another year. We have let them grow with the limbs low down, which has a tendency to make them fruit earlier. They are eight years old and will measure 10 inches in circumference at the foot. These trees were planted by digging a hole in the slaty ground with a pick-axe, into which the nuts were placed as soon as they were ripe. In some instances the soil had to be brought from a distance to cover them, as there was not sufficient ground among the stones to do so. They were put in, three or four nuts in a place, six inches deep, and the ground pressed down firm with the foot.

The little trees come up in the early Summer strong and vigorous, and unless the grass is too rank they will take care of themselves and grow finely without any further care. If the grass is likely to be rank about the spot where the nuts are planted, it should be spaded over at the time they are planted. If planted in rows, the ground can be plowed before the nuts are put in. We have done this and then plowed a shallow furrow into which the nuts were scattered and then covered. It is the best plan to put the nuts into the ground where they are to grow, in the Autumn, unless there is danger of the squirrels digging them out, which they are sure to do if the location is near their haunts. The nuts may be spread upon the ground as soon as gathered and covered with leaves or coarse manure and left until Spring; or they may be put into a box and mixed with sand and left out-of-doors uncovered until Spring. The box should be so open as not to hold water. In either case the nuts should be put into the ground as early in the Spring as it can be prepared.

There are many farms with hill-sides or spots unsuited for cultivation, in which these nuts can be planted and a grove started with no expense or trouble worth mentioning. These same places would furnish as much pasture with the trees as without them, and in many cases more, as the trees would bring moisture. When these trees are grown for timber they can be planted closer together, and should be trimmed to give them an upright growth. They should be put in rows six feet apart, the trees four feet from each other. In after years every other tree can be cut out, if it is found they are too thick, to give room for those remaining. While young, the ground should be cultivated, to make a more rapid growth; but when the trees are large enough not to be injured by cattle or sheep the land may be pastured and no further trouble be incurred. In 30 years the trees will be large enough to cut market logs. F. D. C.

The Vineyard.

RAISIN MAKING IN CALIFORNIA.

I RECENTLY visited three of the largest and most successful grape growers on the coast. One of them was Mr. R. B. Blowers, of Woodland. Mr. B. is making a specialty of raising grapes for raisins. He says that the Muscatel is the best grape for this purpose. He has until recently cured them by laying them on thin boards or platforms, about two by three feet, which he lays in the furrows between the rows of vines. It takes from two to three weeks to cure them in this way. After they have laid several days he turns them by placing another board over the top and turning them over, then removing the top board. Could one depend on fair weather and no rain this way of curing them would be the cheapest and best; but as the grape does not mature until just about the season they expect rain, it very often happens that a storm comes up and destroys the whole crop. So it has become a matter of necessity, in certain portions of California, that those making a business of converting their grapes into raisins must use fruit-dryers that will enable them, in the case of rain, to save their crops. Mr. Blower has, no doubt, the best raisin-dryer in the country. Its capacity is about 20 tons; time required to cure the grapes is from eight to ten days. He introduces heat at 100 degrees into the separate drying chamber and after it is charged with moisture exhausts it by means of an exhaust fan. After the grapes are taken from the dryer they are put in sweat boxes and left from one to two days, the object of which is to equalize them, or, in other words, some that are not as dry as others will absorb the moisture of others. After being taken from the sweat-box they are carefully assorted and boxed.

The seedless Sultana is a favorite raisin grape, and will eventually be the raisin of the future. It is not much larger than our currant, and is seedless; does not take so long to cure, and makes a finer and better raisin. The time is not far distant when California will supply the United States with its raisins. The quality is about as good now as the best imported, and the grape-growers of this State are just waking up to the fact that they can make more money out of their grapes by converting them into raisins than wine The result is that there have been and will be more vines set out this year than in many years past, and California raisins will soon be sought for in preference to those imported.

Sacramento, Cal. VINEYARDIST.

642. Nitrate of soda, imported by the Mapes Formula and Peruvian Guano Co., New York and Hartford; sent by J. W. Hemingway, Plainville, Ct.

Analysis.

[Nitrogen	15.79]
Equivalent to nitrate of soda	95.90
Moisture	3.00
Undetermined matters	1.10
	100.00

Nitrogen costs 26.9 cents per pound.
Costs $12.75 per 300 pounds in New York.

612. Swamp muck, sent by N. P. Perkins, Williamantic, Ct.

This muck was dug last November and has since lain in an open field.

Analysis of 612.

The undried sample contains, per cent.

Water	77.59
Organic and volatile matter [with nitrogen 0.41]	15.65
Ash	6.76
	100.00

The ash contains

Silica and substances insoluble in acid	6.15
Oxide of iron, alumina and phosphoric acid	.38
Lime	.14
Other matter not determined	.09
	6.76
Poisonous iron salts	trace

The dry muck contains

Organic and volatile	69.82
Ash	30.18
Lime	.62
Nitrogen	1.83

The organic matter contains

Nitrogen	2.92

The sample of Soluble Pacific Guano, 565, reported in Bulletin 58, April 28, was from a small quantity remaining over from last Fall in the hands of the dealers, H. A. Stillman & Co., Hartford, and is stated not to represent the article in market during 1881. Its price the manufacturers tell us should have been given as $42 per ton and not $45.

S. W. JOHNSON, Director.

PERSONALS.

Annie Muller committed suicide, in Detroit, because her sweetheart gave his trousers to another girl to mend.

General Rosecrans says that while Garfield was a member of his military family he was lovable and impulsive, and so devoted to his party that he would sometimes give way to partizan zeal.

Mr. George B. Loring, Commissioner of Agriculture, is in Chicago. He is not as enthusiastic about the cultivation of the tea plant in America as Le Duc was. He sees a great development in the cultivation of the sorghum sugar-cane.

Another of the sons of Guinness, the great stout brewer, has married into the peerage, Capt. Guinness having married a daughter of the late Earl of Howth. They were joined at Howth, where her family have resided 700 years without intermission, and in direct succession. Her brother is thirtieth Baron.

Guiteau's mail is every day very large, and consists mostly of postal cards. Some writers condemn him to hell; others volunteer to be his counsel for the sake of the notoriety. One Texas man sends him a bundle of switches with which to whip himself to death; a Georgia man wants to be hangman. There are pictures also. Guiteau is not aware that these things are sent to him.

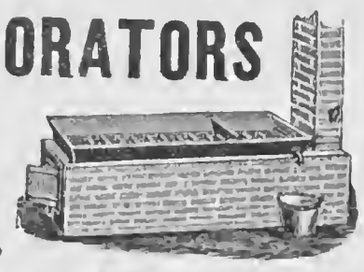
HOPE FOR THE DEAF
Dr. Peck's Artificial Ear Drums
PERFECTLY RESTORE THE HEARING and perform the work of the Natural Drum. Always in position, but invisible to others. All Conversation and even whispers heard distinctly. We refer to those using them. Send for descriptive circular with testimonials. Address, H. P. K. PECK & CO., 858 Broadway, New York.

THE IMPROVED
EVAPORATORS
Make better
SYRUP, SUGAR, AND JELLY,



with less fuel and labor than any other apparatus. Will condense Sorghum Juice faster than any evaporator in use, and consequently make lighter syrup and whiter sugar. The best apparatus known for making jelly from sweet cider. Send for descriptive circulars of Evaporators, Cane Mills, &c. Agents wanted.
VERMONT FARM MACH. CO., Bellows Falls, Vt.

MOUND CITY FEED MILL.

Our Latest Invention.
The most Rapid Grinder ever made. We make the only Corn and Cob Mill with *cast cast-steel Grinders.* If we fail to furnish proof, will give you a Mill. Ten different styles and sizes. The only mill that sifts the meal. We also make the Celebrated BIG GIANT.
☞ Send for Circular and Prices. J. A. FIELD & CO., St. Louis, Mo.

$777 a Year and expenses to agents. Outfit free. Address P. O. VICKERY, Augusta, Me.

AN OFFER
—TO—
CONSUMERS
—OF—
Tea & Coffee.

We have made a specialty for the past *five years* of giving away as Premiums to those who get up Clubs for our goods, *White Tea Sets, Gold Band Tea Sets, Dinner Sets, Silver Plated Ware, &c.* Our goods are warranted equal to any in the country. Full line of every kind and variety. Send postal for Price and Premium List, and mention Rural New-Yorker.

GREAT LONDON TEA CO.,
801 Washington Street,
Boston, Mass.

PRESIDENT GARFIELD.
WE mail, postage pre-paid, on receipt of 25 cents, a fine life-like Steel Engraving of President James A. Garfield, together with a facsimile of his autograph.
CLEVELAND ENGRAVING CO.,
50 Atwater Building, CLEVELAND, OHIO.

CLARK'S IMPROVED ROOT CUTTER

PERFECTION OBTAINED IN
Cutting Roots.

This Cutter has *received* the First Premium *at every Fair*, and has no *equal*. Do not fail to examine it.

The Neatest, Strongest, Simplest, Cheapest, and most Perfect Root Cutter in the Market.

This Cutter is built with a heavy oak frame, well bolted together; is staunch and strong, neatly finished, handsomely striped and ornamented. The cutting apparatus consists of *twenty-five Steel Knives*, (gouge-shaped), so arranged on a wrought-iron shaft that they are perfectly secure; no chance of becoming loose or breaking. The roots are neatly cut in pieces suitable for feeding. No coarse ungainly pieces are left by this Cutter. A boy can easily cut 35 to 40 bushels per hour, so easily does it do its work.

☞ Don't fail to examine it.

We are manufacturing three sizes, designated by numbers, 1, 2 and 3.

Nos. 1 and 2 designed for hand use.

No. 3 is the Power Cutter and will cut 100 bushels per hour.

Price, No. 1..... $12.00
" No. 2..... 14.00
" No. 3..... 22.00

D. LANGELL'S ASTHMA & CATARRH REMEDY.
Having struggled 20 years between life and death with ASTHMA or PHTHISIC, treated by eminent Physicians and receiving no benefit, I was compelled during the last five years of my illness to sit on my chair day and night gasping for breath; my sufferings were beyond description. In despair I experimented on myself by compounding roots and herbs and inhaling the medicine thus obtained. I fortunately discovered this WONDERFUL CURE for ASTHMA or CATARRH, warranted to relieve the most stubborn case of Asthma in FIVE MINUTES, so the patient can lie down to rest and sleep comfortably. Any person not fully satisfied after using one-third of a box can return the remainder to the proprietor and the money will be refunded, or send me your address for a trial package FREE OF CHARGE. Should your druggist not keep the remedy, I can send it by mail on receipt of the price $1.00. For sale by all Druggists. Address D. LANGELL, Proprietor, Wooster, Ohio, or ALBERT IMGARD, Manager, 46 Astor House Offices, New York City.

LANDRETH'S GARDEN SEEDS
Founded 1784.

It is manifest that from GOOD SEEDS ONLY can Good Vegetables be obtained.
The character of LANDRETHS' SEEDS has been substantiated *beyond all question.*
They are the STANDARD for Quality.
Over 1500 acres in Garden Seed Crops under our own cultivation.
Ask your Storekeeper for them *in original sealed packages*, or drop us a postal card for prices and Catalogue.
Wholesale trade prices to dealers on application.
DAVID LANDRETH & SONS, 21 and 23 S. Sixth St., Philadelphia.

PRESCRIBED BY PHYSICIANS.
TROPIC FRUIT
LAXATIVE
Prepared from tropical fruits and plants.

A Delicious and Refreshing Fruit Lozenge, Which Serves the Purpose of Pills and Disagreeable Purgative Medicines.

TROPIC-FRUIT LAXATIVE is the best preparation in the world for Constipation, Biliousness, Headache, Piles, and all kindred Complaints. It acts gently, effectively, and is delicious to take. Cleansing the system thoroughly, it imparts vigor to mind and body, and dispels Melancholy, Hypochondria, &c. *One trial convinces.* **Packed in bronzed tin boxes only.**
PRICE 25 and 60 CTS. SOLD BY ALL DRUGGISTS.

CARPETS.
AT RETAIL
By the Manufacturers.

We have now open an immense stock of Carpetings, including full lines of all the New Fall Patterns and Styles.

Being the product of our own factories, we warrant every Carpet as represented, and full satisfaction is guaranteed or the money refunded.

Axminster Carpets—We offer 300 pieces of these desirable goods at **$1.75** per yard, the same quality as sold last season at **$2.75.**

French Axminsters—A full line of our own importation at **$1.65** per yard.

American Moquette Carpets—400 pieces at **$1.40** per yard—the cheapest carpets ever offered. These goods cannot be found elsewhere in the city at anywhere near the price.

Velvet Carpets—The largest and best stock of Velvet Carpets in the United States at **$1.50** and **$1,60.** Extra good value.

Body Brussels—Best quality, full five frame, at **$1.25** per yard, special patterns at **$1.40** and **$1.50.**

Tapestry Brussels—A very large assortment of popular patterns at **75 cts.** per yard—same goods as sold elsewhere at **90 cts.** Finer grades at **90 cts.** and **$1.05.** A splendid assortment.

Ingrains—Extra superior quality—a very full line from **75 cts.** to **90 cts.** Also a good line of all wool ingrains from **65 cts.** to **75 cts.** per yard.

Persia and **India Rugs** and **Mats** of our own importation, a large assortment at low prices.

SOUHEGAN OR THE SKOWHEGAN BLACK-CAP RASPBERRY.

E. WILLIAMS.

EARLY in July I received an invitation to visit Messrs. Hale Brothers, South Glastonbury, Ct., to see the above new Black-cap. Owing to a mistaking of dates I did not reach there till the day after the general gathering, so that I had the whole field to myself. The fog that had enveloped us all night through the Sound, and all the morning on the river, had lifted just before reaching the landing, and as I stepped ashore the sun shone out with apparently greater intensity, as if to make up for lost time. Taking the wagon path from the landing, a half-mile walk brought me to the village where I inquired my way, and another mile or so brought me to Elm Fruit Farm.

It *was* hot, but from the village out the road was devious and the noble maples and elms lining it on either side, afforded a grateful shade much of the way, and the rolling country, growing crops, and diversity of scenery, rendered the walk a pleasant one.

I went direct to the Black-cap patch where I found one of the proprietors and his pickers gathering the crop. A few rows of the Souhegan, however, had been left untouched and I had a good opportunity to see and taste it. It certainly was very fine and productive, reminding me of the Doolittle as I used to grow it before it was troubled with the blight. *Possibly* the Souhegan may be more productive than the Doolittle as grown there alongside of it; but as the latter had been gathered I could not judge. I think I have seen Doolittles fully as productive, which is saying enough on that point. I believe the new berry will probably average a trifle larger, a little more acid, and a deeper jet black. If a week earlier, as claimed, therein lies its chief merit, and where a local market will take any quantity of them at 16 cents per quart, as the Messrs. Hale were then disposing of them, it will pay to raise them.

A severe rain the previous day had softened the berries somewhat, yet a quart box of them wrapped in a tight package, proved in first-rate condition on reaching home, 48 hours after picking. If the Souhegan has enough vigor of constitution successfully to withstand or resist the blight so destructive to our other Black-caps, it will prove a welcome acquisition, otherwise there is little encouragement to attempt to grow any of them except on a limited scale. A first-quality red raspberry that will stand up like that, would be a great acquisition. Who will produce it?

Returning, I spent a day with your occasional contributor P. M. Augur, of Middlefield, the Pomologist of the Conn. State Board of Agriculture, who with his sons are quite extensively engaged in fruit growing. They have several young peach orchards that are looking well, and the older trees were carrying double the crop they ought to. Crops generally were very promising.

Montclair, N. J.

THE SOUHEGAN BLACK-CAP.

SEVERAL times during the past two months mention has been made in the RURAL of a new Black-cap raspberry the orthography of which has been given as Skowhegan, and as it gives promise of being by far the most valuable of any Black-cap, it seems important that it should at least be given its correct name. This is Souhegan, a name that it takes from that of a small river in New Hampshire, near where it originated some ten years ago. I have watched it carefully during the past three fruiting seasons and find it more hardy than any other Black-cap, and very productive. The fruit is large, jet black, without bloom, very sweet and rich, and ripens *one week in advance of* the Doolittle growing in the same field, and on this account it must prove very valuable for market, as it comes in just at a time when there is a scarcity of fruit, strawberries being nearly all gone and red raspberries and the other Black-caps not being quite ripe. Our first pickings the past season were sent to market along with the Windsor Chief, Glendale and Kentucky Strawberries, and sold at 25 cents per quart, and our whole crop of a little over 100 bushels was sent to market before we picked a single crate of the Gregg, the latter selling from 11 to 16 cents per quart, while the Souhegan sold from 15 to 25 cents per quart. The greater price was obtained not because they were really worth more than the Gregg, but simply because they came earlier when there was less competition, and on this account we shall plant it very extensively. While at the New England Fair of Worcester as well as at the meeting of the American Pomological Society, in Boston, I talked with a number of fruit growers from Massachussetts and New Hampshire, and every one of them spoke very highly of it, all agreeing that its *extreme earliness* and great productiveness, as well as the vigor and hardiness of the plant must make it the most profitable of Black-caps not only for market, but for the family garden as well.

SOUHEGAN OR SKOWHEGAN RASPBERRY.—From Life.—Fig. 488.

The Souhegan originated in 1871 with John A. Carleton, Hillsborough, N. H. from seed of the Doolittle. The fruit you show is from plants set in the middle of July, 1879. The points of value of this variety are: hardiness of the plant—it passed through last Winter all right while the Gregg, Doolittle and Mammoth Cluster in the same field were more or less damaged; productiveness and early ripening, ripening in Connecticut about June 25, or a week before the Doolittle. When first brought to our notice, Mr. Carleton, the originator, claimed that it would produce four times as much as any variety in cultivation, and offered to pay our expenses to New Hampshire and back if we did not find it as represented. We therefore paid him a visit and were so well satisfied that we purchased the entire stock and have now about an acre in cultivation.

Mr. Downing, under date of July 16, 1881, writes: "A friend near me has two plants of the Souhegan Black-cap which I saw last week, and I was much pleased with them, as they are quite early, of large size, very productive, quite firm and of a deep black color and sweet flavor. From what little I have seen of it, I would think it a very promising variety for the market."

All of the experienced berry growers who have seen it on our grounds unite in saying that it is far ahead of any other Black-cap now in cultivation.

South Glastonbury, Ct. J. H. HALES.

[We had pretty good authority for calling it Skowhegan; for in answer to our inquiry on this question Mr. Charles Downing wrote: "It is Skowhegan, but as it is more generally known as Souhegan it would be well to say Skowhegan or Souhegan."—EDS.]

RAYS.

ON the occasion of the meeting of the American Pomological Society at Boston the other week, what a happy time we had and a profitable! Jolly Berckmans came from Georgia, well-skilled Warder from Ohio, profound Lyon from Michigan, good-hearted Watson from far-off Texas, matter-of-fact Saunders from Washington, exuberant Coleman from Missouri, refined Parsons from Long Island, and such a lot of other "boys" were there from everywhere, the happiest and the jolliest of men. And how we greeted dear old friends and long absent faces, and joyfully received introductions to the planets we had not seen before, and thus absorbed in mutual love and sympathy with one accord sat down and tried who best could work and best agree. But still there was a gap as there is everywhere—there was no Douglas there or Meehan, nor were there many others that we wished to see, but we forgot them not.

* *

BUT don't we men folks catch it in "What Others Say" p. 566! And what Turk-rascals those rich farmers in those rich agricultural regions are to impoverish their wives and children so, and feed and house and care so well for horses, cows and sheep! If they had some of my neighbors' wives around, they would quickly learn that women in America have mighty rights—and know it.

* *

AND a little further on I find—the men of family, in a majority of cases, and not the women, are barbarians! Good gracious! Why? Because there are no flowers around the house. "Go where we will in the United States, the flowers about the house are almost infallible signs that there is a woman about." No such thing. Tending flowers is easy, happy, pleasant work, a becoming pastime task for women; men yield it over to them as they do the cook-stove. But men who live alone in settled homes in which are no women, old bachelors we may style them if you please, usually have neat and comfortable dwellings, and almost invariably lots of flowers.—But let me give you a striking instance from the far Northwest:

* *

LAST year in the interest of the Tenth Census of the United States, Sereno Watson, the eminent California botanist, traveled in the far Northwest and was now in the mountains that separate Montana from Idaho. He had taken the Lola Trail and experienced in it great difficulty and peril—* "For five days and for over 100 miles we were up as it were among the clouds rarely below 6,000 feet altitude and as often above 7,000, the greatest difficulty, however, being the scarcity of grass for our horses * * * the animals were for two nights without anything to eat. But as there comes an end to all things, good or bad, we at length reached the end of the spur which we had been following, and came down into a grassy meadow with a stream * * * Pushing on the next day down the valley and coming upon signs of inhabitants, cattle, a mown meadow (and the grass cut with a mowing machine, too), Indians preparing camass, and finally a fine, large ranch with wheat and oat fields, a comfortable house, and a nice garden with vegetables, fruit and flowers—'There must be a woman here," I said. But I was mistaken—two bachelor brothers again. Here we got fodder for our horses, good "square meals" for ourselves, and sleep on the hay-stack—as I find in my note-books."

* *

SPEAKING of the dwellings in the mountains, Mr. W. says: "These solitary houses, of which I came upon many in my journeying, are occupied usually by single men, old bachelors that is, sometimes alone, sometimes in pairs, squatters upon some bit of meadow land, perhaps, which they have found in the mountains, and which they have fenced in and cultivate in the hope that it may some time be valuable

* From MSS. given me by the author, Mr. Watson.

and in the meantime give them occupation and a living. Their cabins are often as neat and orderly as though woman had been there, but they readily admit their loneliness."

* *

EMPLOYER to workman sneeringly—"Well Walt. feel warm out there?" "Warm!" exclaimed Walter, "Why, hot is no name for it, it is regular roasting. You come out and try it." "No sir," said his employer. "You s e what it is Walt. when I was young I saved my money and now that I am getting old I can afford to sit comfortably in the shade and hire shiftless fellows like you to do my work."

* *

UNDER the name of Petunia hybrida florepleno fimbriata I got a packet of seeds last Spring and paid a big price for it. The seeds were very few because the petunia in question was an exceedingly fine, new novelty, but they germinated readily, grew well, were planted out and in due time blossomed. Mostly all had fimbriated, or frill-edged, flowers, about one in eight was double; all were of the coarsest-growing nature and the colors of the flowers among the most miserable found in petunias. But under the name of Petunia hybrida nana compacta I got another packet of seed (and for one-third the price of the double-fimbriated one) which gave me good satisfaction. The plants, though not so neat and pretty as their pictures, are compact, neat and copious, and without exception their blossoms have been beautifully striped, or, if plain, intensely colored.

* *

One of our finest September perennials is Chrysanthemum uliginosum; it grows some three to five feet high and bears a copious crop of large, showy, white, daisy-like blossoms. It is grand with me just now. But my good friend, John Saul, the nurseryman at Washington, has had sad experience with it. A few years ago, wishing to add some of the finest hardy herbaceous plants to his nursery stock, he imported this chrysanthemum, and since then has propagated, advertised and sold it. But what an amount of abuse it has brought him! It has grown well and bloomed well, but some of his customers declared it was only a White Weed, and heaped opprobious imprecations on the head of honest John, who when he failed to pacify them by explanation, refunded to them their money. Now, this shows a deplorable lack of ordinary observation on the part of those customers. The leaves, manner of growth and time of blooming of the chrysanthemum in question are entirely different from those of the White Weed.

* *

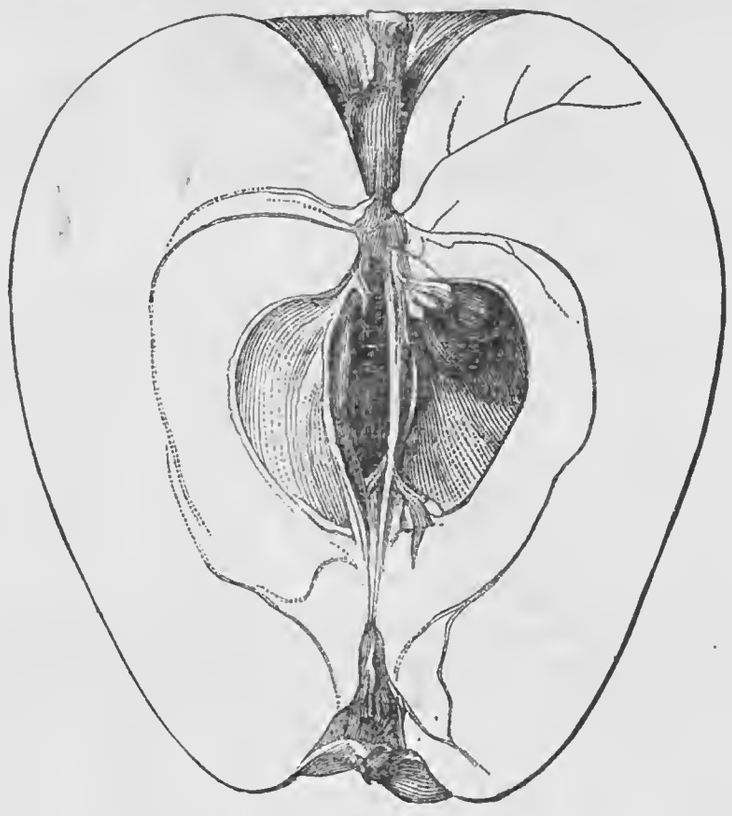
SOMETIMES plants behave differently in different places, as is the case with Parry's Marigold, botanically named Tagetes Parryi. This is a "new" species indigenous to the mountains of northern Mexico, where it was discovered in 1878 by Drs. Parry and Palmer. Dr. Palmer who first discovered it (and not Dr. Parry as the name would imply) told me that as soon as he saw it he knew it was something good for cultivation, it was growing in the rocks and a solid mass of yellow. He gave me some seeds and I have grown lots of it ever since, but I cannot recommend it as a decorative plant—it grows too much, blooms too little and smells too bad. Why should cultivation change its habits? Because we change the natural conditions of its growth. In its native habitat it ekes a scanty living high and dry among the rocks, and by its true perennial nature assumes a scrubby habit more incitant of flowers than leaves. A year or so later Hallock, Son & Thorpe, of Queens, L. I., advertised and sold it as a novelty under the impression that in cultivation it would at least maintain the reputation it received as a wilding. But their customers reported unfavorably of it, and the firm repented having sent it out. But the firm was not to blame. In fact, I admire and endeavor to encourage that spirit in our florists which seeks that which is new and of good repute, to disseminate it. Wild plants, home or exotic, are usually improved by cultivation, and this case of Parry's Marigold being the reverse is simply because we have reversed the conditions of its natival state.

* *

I WISH I could attend the horticultural exhibition now being held at Cincinnati, but I cannot do so conveniently; however, I am informed they have a fine and well patronized display of plants and flowers, and surely they made great preparation for it. My eminent Ohio friend, Dr. John Warder, called on me the other day; he was as radiant and brilliant as ever, and expressed himself highly pleased with the Cincinnati exhibition so far as the plants were concerned, but, oh, how he deplored the floral abominations in the shape of bouts and monkeys and such-like wretched nonsense. Show cut flowers singly, in bunches or gracefully and harmoniously mixed in bouquets, so that every flower shall mean a flower and maintain its individuality as a blossom, and use not these lovely jewels to paint a vile contortion.

* *

BUT on the occasion of the meeting of the A. A. A. S., at Cincinnati a few weeks ago, I had an opportunity of observing the preparations being made in the horticultural department of the Great Industrial Exposition now being held there. Though the building is a large one, it was said to be barely ample for the flower show. There is a large grotto built of shaggy stone and cement, and overhead the roofs and archways in it are



THE CHENANGO STRAWBERRY APPLE.—FIG. 488.

lined with unequal ropes of tow in imitation of tree roots and the whole thing whitewashed in drab and sprinkled over with minced glass for effect's sake in gas-light. The front of this rockery is thickly clothed with mosses, ferns, vines and little trailing plants and dwarf firs and spruces, while adown its steep and rugged face a torrent of Ohio water came splashing over. And wimpling through the building, in a cemented, tortuous bed well jarred and jagged with rocks, a goodly stream of water spread, its sides being lined and banked with ferns and mosses and other appropriate plants. The bank-heads and plots were to be sodded over, and on these, as tables, the exhibition plants were to be set. On a clump of irregular tree-limbs in a corner were to be suspended the handsome East Indian pitcher plants belonging to the Cincinnati Floral Company. The end of the building were shrouded in long-running vines, as the Madeira, and the walls were hidden altogether in wood-moss. This moss, brought mostly from Kentucky, had been gathered in sheets in the woods and now stuck to the walls with paste just as we would paper.

LEON.

Green Peas in the Fall.

In answer to the inquiry "whether any of the readers of the RURAL have ever been so successful as to obtain a good crop of green peas in the Fall months," p. 666, I would state that a few years ago I forked over a plot of ground from which a crop of Philadelphia Extra Early Peas had been taken, and fertilized and sowed it to turnips, and a fine self-planted crop of peas sprang up and yielded well. I never saw finer peas of that variety. I have never renewed the experiment, because I have never had an occasion to do so. I usually plant four or five varieties in the Spring, planting for a succession, and get all the peas I want without the trouble of planting a second crop. I should, however, plant a second crop with a good deal of faith that they would succeed, though I very well know that the garden pea has been persistently bred as an early Spring or cool-weather vegetable.

Georgia, Vt. O. S. B.

Pomological.

THE CHENANGO STRAWBERRY APPLE.

THE Chenango Strawberry Apple is one that, not only from its showy appearance but from its quality, meets with a very ready sale in our markets during September and October, too. Our drawing is from a specimen sent to us by Mr. J. T. Lovett, of New Jersey, and is of a fair average size. It originated in the town of Lebanon, Madison Co., N. Y. Mr. Downing says that it is much esteemed as a table fruit wherever grown. The tree is vigorous, spreading. The fruit is of a whitish color, shaded, splashed and mottled with light and dark crimson over most of the surface. The flesh is white, very tender, quite juicy, mildly subacid. It thrives best in Kentucky, it would appear, according to the reports of the American Pomological Society, and very well in Nova-Scotia, New Hampshire, New York, Ontario, Michigan, Wisconsin, Ohio, Nebraska, Utah, Alabama and Louisiana.

MARSHALL PEAR.

WHILE at the Mineola Fair we were presented with a box of Marshall Pears by Mr. P. H. Foster, Babylon, Long Island, This pear originated on the farm of William Marshall, N. Y. and is now, we believe, for the the first time offered for sale. It reminds us, in appearance and in quality, of the Buffum, though the flesh is finer-grained, more buttery and of a perceptibly higher flavor. As shown in our engraving, which is a portrait of one of those presented to us by Mr. Foster, the shape is roundish—somewhat obtuse-pyriform. The skin is well covered with russet; the stalk very long; cavity small. In quality it may be described as buttery, juicy, somewhat aromatic and vinous. The flesh is white. The tree is said to be moderately vigorous though very productive. It ripens 10 days after the Bartlett and, it is claimed, possesses first-class shipping qualities—a claim which, on account of a rather hard skin, is no doubt just. See illustration, page 700.

PACKING APPLES FOR MARKET.

IT is no uncommon thing in the country to hear fruit raisers complain that their shipments to city markets do not bring as good prices as they should, and the blame is at once saddled upon the commission merchants. Now, there is said to be a cause for everything, and the cause of poor prices for fruit must be in the condition of the fruit itself, in its unwholesome appearance when it arrives at the market, in the poor quality or variety, or it is owing to an over-stocked market. A great many disadvantages, however, may be largely avoided by care in assorting and packing the fruit for shipment.

A careful assorting is quite essential in order that no unsound fruit may find its way to the barrels and that one variety only as uniform in size and quality as possible, may be put in each package. It is an unfortunate habit, which some have fallen into—that of pouring the picked fruit directly from the picking bag or basket into the shipping barrel, leaves, broken twigs, etc., included, and still more unfortunate is it to put even fair-looking "wind-falls" into the package, and sell them for picked fruit.

An interesting experiment, as tried a few years since at one of our agricultural colleges, was as follows: Two barrels were filled with apples, just as picked from the tree; then two barrels were carefully graded and marked No. 1 and No. 2. The ungraded brought in the New York market the same price as No. 2, though probably three-fourths of them were as good in quality and size as No. 1, and the barrel marked No. 1 brought 50 cents more than No. 2. Assorting will pay.

In packing, turn the barrel bottom-side-up; remove the head which is opposite the one on which the address is to be stamped, and place a layer of apples, with stems down, upon the head. Then fill the barrel, shaking it down occasionally, so that the head must be pressed in snugly with a lever. This can be easily done by nailing a cleat upon any upright standard, a couple of inches higher than the top of the barrel; then, rolling the barrel up to the standard, place a piece of joist six inches long upon the barrel head, on which to rest the lever, while one end is placed under the cleat. While one person presses down on the lever, another can nail in the head. Mark the barrel plainly with names and addresses of both consignor and consignee, and the amount and variety of fruit contained in it and it is ready for shipment.

Our foreign friends are disposed to find fault with the American method of packing fruit, and they have reason for so doing. Nothing is surer to destroy our good reputation in commercial transactions with foreign countries than deception and dishonesty. Already they have found out that in the packing of fruit there is a too general tendency to place the best on the top of the package where it may give a good name to an inferior article beneath. Such a practice should not be allowed to go on, and the fruit-growers are the ones to remedy it. What is true of foreign dealers is equally true of home-dealers—all deprecate the practice as something tending directly to injure trade in this line, and to foster a feeling of distrust on the part of the purchaser, and this once established is not easily removed.

Field Crops.

RYE AS A SOILING CROP.

HENRY STEWART.

THE dry season has brought into prominent notice the subject of green fodder crops. Pastures and meadows have been seriously injured by the drought and the Winter store of fodder has been already drawn upon for the support of the stock. There cannot fail to be a scarcity of fodder in the Spring, and it will not do to turn cattle upon the meadows already weakened by the want of rain for ten weeks consecutively. Some provisions for the supply of the cows will be required. There is none that can be so easily made as by sowing now a few acres of rye. This should be done as soon as possible, because an early start, if the ground is good and the season propitious, will afford some pasturage before the Winter sets in. To secure this will repay the cost of a moderate application of fertilizer, which will not only begin to return its cost this season, but will make a second dividend in the Spring. For soiling or for pasturage, rye will be found the most valuable crop of the season. It is cheaper than wheat, is far better as a fodder, and is ready for use earlier. It is productive of milk if it is cut before it is hard and dry, and the surplus, if cut before the grain is formed, makes excellent hay. It will make a good crop of fodder upon poor soil and on this account is especially adapted for the beginning of a course of improvement of a poor farm.

But there are some points in regard to its culture and uses upon which erroneous ideas are current. In the first place, there needs to be a thicker seeding than is usual, when the crop is grown for grain, and the poorer the soil the thicker should be the seeding up to four or five bushels per acre. I have sown all the way from two-and-one-half to five bushels to the acre, and three-and-one-half or four, have given the best yield of the best fodder, which is all the better the finer it is. Thick seeding gives a thin, slender, tall, leafy growth which is the best for both fodder and hay. With three-and-one-half bushels of seed and 300 pounds of a "complete" concentrated fertilizer, I have grown a crop which cut 110 pounds of green fodder to the square rod, or more than 8¾ tons to the acre early in May. This is quite equal to the maximum expectation of the yield of soiling crops, which is, that the produce of a square rod should support a cow for one day, and an Ayrshire or Jersey cow will not consume more than 60 pounds of green rye in a day, when she is provided with four or five quarts of meal with it.

The most disappointing mistake in regard to this crop is that it can be cut several times in the season. This is altogether out of the question. The habit of growth of rye is to throw out a bunch of radicle leaves, or imperfect stalks with spreading leaves, in the Fall. If the season is warm and long-continued, the roots spread by throwing out new sets of similar leaves until the ground is completely covered as with a sod; if the seed has been sown early and the warm weather continues, the stalks may throw up from the center of each an ear-bearing stem, the ear of which may or may not emerge from the sheath. In either case, to cut this or permit it to be grazed off, destroys the ear, and the plant must throw up new off-shoots from the roots or the crop of grain is destroyed, so that a very vigorous crop needs to be pastured down in the Fall, not so much to prevent smothering in the Winter, as some think, but to check its luxuriance and succulence, which encourages the growth of seed stalks in the Fall and which cause it to succumb to the frost or to rot under the close covering of a deep, wet snow. In the Spring the plants do not tiller so much as in the Fall, unless when very forward and vigorous they are pastured down and checked somewhat; but they soon throw up the ear shoot. If the crop is cut, this

must be done before the sheath has come into range of the scythe, otherwise the embryo ear is cut off and the crop is confined to those stalks which have so far been delayed in their growth by the vigor of the leading ones. At any rate, then the cutting must necessarily be done while the herbage is small and before the main shoots have grown to a length of three inches, else the second growth will be very light. The first cutting of rye, in fact, will be so light as to be hardly worth taking, and, if it is worth it the second growth will be very light. I have grown rye for soiling more or less for 15 years, and have never yet found it to yield a double cutting worth the labor; if the first is good for anything, the second is next to worthless; and if the second is to be good, the first must be taken so early as to be of little value. There is very little growth in rye before April, and as rye often shows ears in April it must be very clear that there cannot be time to make much of a first cutting and yet get a second one. In fact, one may, under favorable circumstances, turn a few calves on to the rye in the Fall or Spring, but not cows, excepting under special and rare circumstances, and then merely to save the rye, rather than to feed the cows a full meal.

When the heads appear the cutting of rye may begin and may last until it is in full blossom, when it should be cut and made into hay. At this time, which will be in June, the clover and early grass will be ready for cutting and the rye will be getting hard and woody. Rye has often disappointed those who have grown it for soiling, because it has been cut too late; for as soon as it gets tough and hard, it is a poor milk-producing food; but when it is young it is different. As soon as the blossoms appear it should be cut and not left a day longer.

When there is ample store of fodder, the rye cannot be put to a better use than to plow it under as a green manure for corn. This can be done with ease, when it is five or six feet tall, by means of the drag chain recently described in the RURAL, and the stalks completely covered; the surface should then be rolled, and harrowed only with a sloping-tooth harrow, so that the rye is not torn up. This course pursued for a few years, with rye and corn alternately, and the rye sown again on the corn stubble, will make a light soil as rich as a garden. If this is done or proposed to be done, there should be twice as much rye sown as will be cut, and then one-half can be plowed in, in alternate years. In cutting the rye it should not be forgotten to leave a sufficient quantity to the last, and put it in sheaves and dry it for making bands for binding the fodder corn in sheaves. This is the most convenient manner of putting up fodder corn, and rye straw is the best material for binding.

CORN NOTES.

C. A. GREEN.

I PLANTED pure white seed corn without one kernel of mixture with any other color, yet on harvesting I find one quarter of the crop is pure unmixed dark red in color, and nearly twice as productive as ordinary varieties, the ears being much more numerous, and of amazing length. There was no red corn growing in the vicinity—indeed this freak of the red ears is not a new one, but it appears in this variety of white corn regularly. I shall plant the red corn by itself next season and note the results. Our corn, being on low ground, was not at all injured by the protracted drought. There are few crops that reward the farmer more generously for attention in selecting desirable seed than corn. By selection we can, in time, make a variety combining almost any qualification desired.

I have now, Sept. 27, a considerable portion of my 10 acres of corn husked. I have never been able to see the policy of deferring corn-husking until the weather becomes so cold as to benumb the whole person, and render a full day's work impossible, and until the days are so short and the weather so uncertain as to prolong the job indefinitely. I instruct my men to husk only the merchantable ears, considering the safest place for the soft ears and nubbins to be with the stalks, where the stock will find and consume them without waste. I believe the time will come when we shall have perfected machinery for husking rapidly in the field, or else for thrashing out the corn, as we now thrash wheat. Corn is a wonderful crop, full of beauty, utility and profit; but the ingenuity of the age has not yet grappled with the problem of harvesting it economically. It is not only our main reliance for fodder, for pork, mutton, beef, and alcohol, but now does much towards supplying us with sugar and sirup. The loss of no crop is felt so keenly, as we are all likely to realize after the present light yield. Who will invent machinery for harvesting and thrashing this important product. A reaper should cut and leave it in gavels, where it should lie until partially cured. Then it should be bound with willow bands in small bundles and shocked until fully cured. Then we should have some machine for thrashing it. If the thrashing could not be done otherwise, the stalks and corn could be run through a ponderous cutter and chopped into pieces, and then thrashed. There is certainly some way of securing the desired end. Where the corn is designed to be fed on the premises, these chopped stalks and corn can be fed without waste to all stock except swine, and this is an economical method of harvesting. A husking machine is now manufactured, but how far it is successful I have not been able to learn. A publisher solicited its advertising, and was advised that as the demand for machines far exceeded the supply, the company could not spend money in advertisiug. But as I have not found this machine, or any other, on exhibition where every opportunity was offered to show farmers what it could do, and considering the multitude of machines that could be manufactured in an emergeney, I suspect this invention is not perfected far enough to induce farmers to use it largely. I am not posted, however, and should be glad to hear from those who are.

Monroe Co., N. Y.

Sprouting Crab-Grass---Panicum Proliferum.

THIS is an annual grass having smooth leaves and stems. The leaves are a foot or two in length, flat and rather broad. The culms are thick and succulent and much branched. The panicles are large, pyramidal, the slender branches spreading, the culms become two or three feet high, or much higher. It is found on salt marshes, especially on sandy soils, from Massachusetts southward. It flowers in August and September. The anthers are orange-colored. Cattle and horses seem very fond of the plant. In the South it is quite a common weed in corn fields. Mr. Mohr, of Mobile, in the Agricultural Report, says: "In damp, grassy places it prefers rich ground, throughout the coast region. It commences to vegetate vigorously in the hottest part of the Summer months. The foliage is rich and tender, and the succulent, rather thick stems are sweet and juicy. After cutting, it throws out numerous sprouts from the lower joints, which grow rapidly so as to allow repeated cuttings until frost."

Mich. Ag'l Coll. PROF. W. J. BEAL.

SPROUTING CRAB-GRASS.—FIG. 469.

JUTE CULTURE IN LOUISIANA.—Herewith I send the RURAL a sample of jute fiber obtained from my Point Clear plantation in this parish. The seed was sown in the latter part of last March and in the first days of August the plant had reached a hight of from 10 to 14 feet. A part of it was cut down and steeped during eight days, when the bark was entirely gone, having dissolved like so much starch and leaving the fiber hanging loosely to the stalks. This was easily separated by hand and thrown on the ground to dry. It was afterwards worked through a "hackle" by hand and then washed in clear water. Nothing more was done to it—and the fiber speaks for itself. I calculate that, planted in drills four feet apart, it will yield 1,200 pounds, and sown broadcast not less than 2,000 pounds. I have 25 acres of jute covered with seed, which I shall permit to mature, as I intend to make a heavy planting next year—say 300 acres, and shall then have a good supply for sale. I do not seek notoriety but merely desire to show to what additional use our rich soil can be put.

[The sample is three feet long, the fiber strong and silky.—EDS.]

The Herdsman.

STOCK-FEEDING UNDER DIFFICULTIES.

PROFESSOR E. W. STEWART.

Suggestions for the Season.

PERIODICALLY our farmers are forced to face a failure of pastures with short forage and grain crops. "Misfortunes seldom come single," but skill is only shown under difficulties. If the farmer's crops were always good, his cattle always thrifty and healthy, prices always satisfactory, I fear there would be less progress than now. The farmer must learn to face all his difficulties and conquer them all.

This season has brought one of the most severe droughts ever experienced. It literally went to the root of pasture grasses and dried up their juices in a remarkably short time. Its extent is the whole country, commencing first in some of the Southern States, but reaching all the States before the middle of August. The favorable point is that many of the States affected by drought matured a fair hay crop before the dry weather became severe; and this will lighten the situation in those States very much. The corn crop is so much reduced that its price will be raised at least 60 per cent. over last year's price. This will be a very serious obstacle in those States where the corn crop furnishes the staple article, both of grain and coarse fodder, for winter-feeding and fattening. It will reduce exportation of corn, which I do not think a calamity, for it is much more profitable to feed our corn and export our meat instead.

The straw crop is also a moderate one, and was formerly considered of little account in feeding, but is now better appreciated. The method of harvesting the corn crop in the Western States renders the stalks, or stover, of very little value as food for cattle, and still less for sheep. They become mere dried, woody fiber. If the corn were put in shock as soon as the ear reaches the dough state, and while the stalk is green, the stover would have a value of one-half to two-thirds that of hay.

FALL MANAGEMENT IN DROUGHT.

The question first to be considered is that forced upon farmers everywhere for immediate decision—What is the best plan of Fall management in view of the severe drought? The first and general answer to be given to this question, and in which all good feeders will agree, is to supplement the pasture with other food to make a full ration. Nothing can be more opposed to profitable feeding than to compel young and growing cattle or milch cows to live upon short rations during the mild weather of the Fall. Nature indicates a mild temperature as the most favorable condition for producing growth, flesh, fat or milk from a given quantity of food. The same food will produce during October from one-third to two-thirds more growth, fat or milk than in cold weather. Young cattle should be pushed so as to reach Winter in fine, thrifty condition, and those intended for fattening should be made to lay on flesh and fat as fast as possible during the mild weather, so as to render the finishing process in cold weather the more easy. If they are suffered to reach cold weather in a thin and unthrifty condition, they are less able to withstand the cold, and with impaired digestion can make only very slow progress with full feeding in Winter. It is, therefore, simply strict economy to feed such growing and fattening cattle a full and generous ration during the mild Fall weather. And for milch cows good feeding is most imperative, or the profitable production of milk, for which the cows are kept, will cease. This principle of feeding is most evident to all who have studied the subject.

DRIED GRASSES AND CLOVERS.

Where prudent foresight has been exercised, clover, at the first indication of blossom, has been cut early in June, nicely cured and put away for a time of need. This is only slightly less nutritious and appetizing to cattle than the green clover itself. And the time of need is now everywhere that pastures are short. The cattle, put into barn and fed over-night with this sweet-smelling clover hay, will go into the pasture in the morning with such satisfaction as hardly to miss its aforetime freshness. Those farmers who sow Timothy and clover for home feeding, and have cut it when the clover reached its first blossom, will find this delicate, preserved grass most welcome to their cattle now. The miscellaneous grasses of our meadows, cut also in the greatest succulence, and nicely cured, will furnish a most excellent supplementary food to the brown and bare pastures. All these grasses and clovers will also have yielded a second crop, even in this past season. Being cut so early, the grass starts anew and so vigorously as to produce a respectable second crop before the drought stops its growth. These second crops, thus cured, are the best substitutes for pasture

obtainable, except when the same grasses and clovers are preserved in silo.

GRAIN A SUBSTITUTE FOR PASTURE.

But when the farmer has not cut these early crops of clover and meadow grasses, and has only common hay, then it is profitable for him to use grain in some form to feed with common hay as a substitute for pasture. The farmers of our Eastern and Middle States are quite accustomed to regard grain as a comparatively expensive food; but this is a misapprehension of the facts. Hay throughout the Eastern States will at present average about $20 per ton, and is not much less in any of the Middle States. Let us, therefore, make a comparison between hay and grain, including by-products of grain and manufactures of oil-bearing seeds. The painstaking Germans have endeavored to find the feeding value of different grains and forage plants from actual feeding trials assisted by chemical analyses. They have taken meadow hay as the standard of value and compared these other foods with it. The following table will show the digestible constituents of hay, grain and by-products used as cattle food, and also the value of each compared with hay. This table will be convenient for reference for the reader who wishes to know the comparative prices he can afford to pay for different foods:—

	Digestible nutrients.			Nutritive Ratio.	Compared with meadow hay.
	Albuminoids.	carbohydrates.	Fat.		
Meadow hay medium	5.4	41.0	1.0	8.0	1.00
Red clover hay "	7.0	33 1	1.2	5.9	1.08
Alfalfa " "	9.4	28.3	1.0	3.3	1.10
Swedish clover	8.6	34.8	1.8	4.6	1.19
Timothy hay	5.8	43.4	1.4	8.1	1.09
Upland grasses, average	5.3	40.9	1.1	8.2	1.00
Indian corn	8.4	60.6	4.3	8.6	1.73
Oats	9.0	43.3	4.7	6.1	1.53
Barley	8.0	58.9	1.7	7.9	1.47
Rye	9.9	65.4	1.6	7.0	1.68
Millet	9.5	45.0	2.6	5.4	1.45
Buckwheat	6.8	47.0	1.2	7.4	1.19
Peas	20.2	54.4	1.7	2.9	2.25
Flax seed	17.2	18.9	35.2	6.1	3.85
Cotton seed	17.1	14.7	27.3	4.7	3.24
Wheat bran	10.0	48.5	3.1	5.6	1.58
Wheat middlings	8.9	54.8	2.6	6.9	1.56
Rye bran	10.6	50.0	2.3	5.3	1.56
Buckwheat bran	13.5	44.0	3.9	4.1	1.79
Pea-meal bran	9.2	45.8	1.2	5.3	1.34
Millet bran	4.5	38.8	2.7	10.1	1.02
Barley bran	11.5	43.2	3.6	4.5	1.62
Corn bran	6.2	55.1	3.6	10.3	1.42
Corn-starch meal	8.2	19 3	1.8	7.4	0.60
Brewers' grains	4.8	11.3	1.2	3.0	0.56
Malt sprouts	20.8	43.7	0.9	2.2	2.08
Linseed cake	27.6	27.0	10.4	2.0	2.98
Linseed meal (extracted)	27.8	33.9	2.1	1.4	2.51
Cotton seed meal (decorticated	33.2	17.6	16.2	1.8	3.60
Cotton seed meal (undecorticated	17.5	14.9	5.5	1.7	1.75

The above table is based upon 100 pounds' weight of each article. Meadow hay means the miscellaneous grasses grown in old meadows, and this represents the unit of value, 1; and when the other articles of food have a higher value, the figures show the fraction above, or if less, below; as, for instance, Swedish or Alsike clover is 1.19; corn, 1.73; that is, corn is worth 73-100 more than good common hay. Thus, if 100 lbs. of hay are worth $1, then 100 lbs of corn are worth $1.73, or 97 cents per bushel; wheat middlings worth $1.56, and oats $1.53 per 100 lbs., or 49 cents per bushel. Peas would be worth $2.25 per 100 lbs. or $1.35 per bushel; barley, 70 cents per bushel; rye, 94 cents; buckwheat, 51 cents; flax-seed, $2.15 per bushel. This comparison will show that grain of the various kinds is not dearer than hay at the market prices, except, perhaps, barley, which, on account of its large use for malt, bears an exceptionally high price. As compared with hay at $20 per ton, corn, oats, rye and peas are usually cheaper than hay.

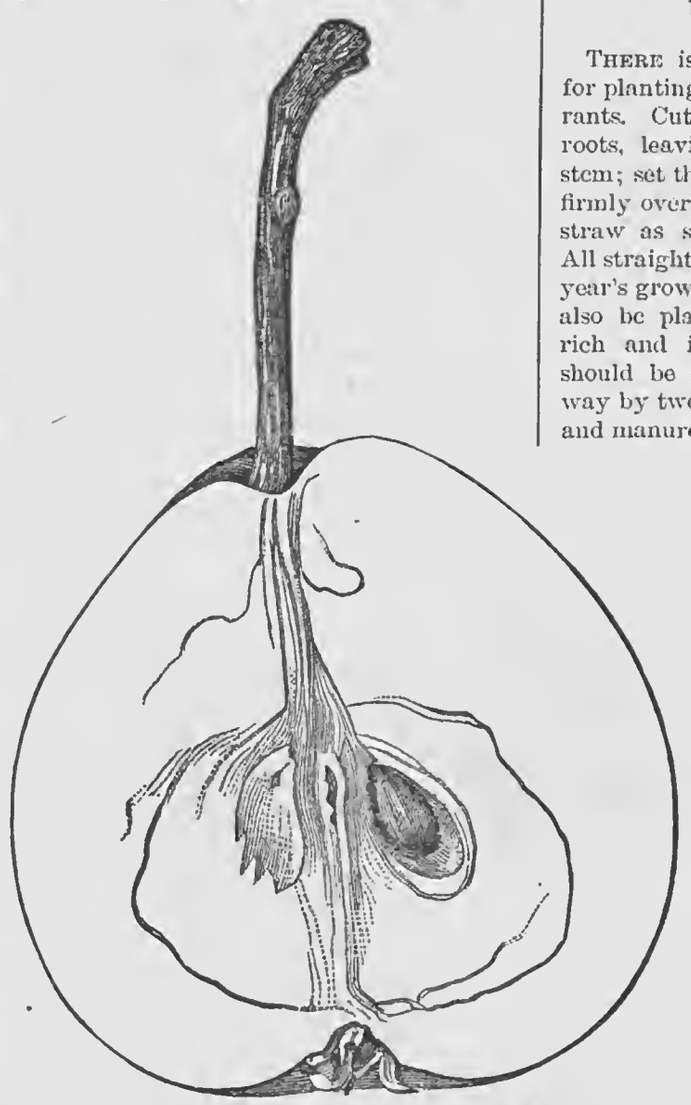
REFUSE OR BY-PRODUCTS.

But we shall find the most economical substitute for pasture in wheat middlings, bran, malt sprouts, linseed meal and cotton-seed meal. Let us figure these with hay at $15 per ton or 75 cents per 100 lbs.; then middlings and the different kinds of bran would be as cheap at $23.40 per ton or $1.17 per 100 lbs.; linseed meal (extracted or new-process) would be as cheap at $1.93 per 100 lbs.; decorticated cotton-seed meal at $2.70 per 100 lbs.; malt sprouts at $1.66. Now all of these can be bought, where on sale, at less than these figures, except middlings, and some of them for 30 to 40 per cent. less. We thus see that the prevalent opinion that grain is a more expensive food than hay, is quite erroneous. Another important advantage in favor of grain is that it is easily combined with all kinds of coarse fodder, so as to make it a well-balanced ration. This enables the farmer to feed everything profitably. Let us now examine the

RATION FOR CATTLE ON PASTURE.

The object is to give all animals full rations for growth, fattening or milk. As we have seen, the farmer cannot afford to let his animals go with scanty, unnourishing rations, and the question is—What ration is the cheapest to fully make up for the short pasture?

The table I have given above will offer a large number of foods to select from. And, first, if a stable is near to the pasture, then it is better to feed in the stable; if not, long troughs may be used in the pasture for young and fattening cattle. The farmer who is provided with a cutter to run by power, may cut several tons of hay in the barn, which may be carried to the field in a large box as wanted. This cut hay, put into the troughs, may be mixed with grain or ground feed. If middlings or any fine feed is used, it may be mixed with the cut hay in the barn and carried to the field ready mixed; or the hay may be placed in the trough and the ground feed or grain spread on top in due proportion and mixed in slightly. Long hay may be used in the same way. The cattle will then, necessarily, eat the hay and grain together—a matter



THE NEW MARSHALL PEAR.—FROM LIFE.—SEE PAGE 698. FIG. 491.

of a good deal of importance in the digestion of corn especially.

Among many other rations the following may be fed. For one to two-year-olds: 2 lbs. middlings,, 2 lbs. new-process linseed meal, 4 lbs. hay; or 2 lbs. of oats and 2 lbs. of corn; 2 lbs. of decorticated cotton-seed meal, 2 lbs. of wheat bran; or 2 lbs. of wheat middlings and 2 lbs. of malt sprouts soaked for a few hours—the hay being used with each ration.

For cattle of 1,200 lbs.: 2 lbs. of corn or corn-meal, 4 lbs. of linseed cake, or new-process meal, or cotton seed meal, with 4 lbs. of hay. If the cattle are to be sold for beef early then double or treble the amount of corn or corn meal; or, probably the best ration in Fall on poor pasture, for cattle of this weight would be, 3 lbs. middlings, 3 lbs. corn or meal, 4 lbs. new-process linseed meal and 4 lbs. hay. This is not a heating ration, but well adapted to lay on flesh or fat, and the variety would make it palatable—a matter of importance in fattening. The feeder can combine a large number of rations from the above table, choosing those most easily and cheaply obtainable.

MILK RATION ON POOR PASTURE.

With the dairymen this extra feeding must not be delayed on such sun and drought-burned pastures. No profitable milk production is possible without full rations. And the dairyman is in a situation, with butter at 35 cents a pound, to look with complacency upon this extra feeding, for the milch cow repays him every night with good interest for all his extra rations.

It is important to provide for the health and strength of a cow as well as the production of milk. Professor Horsfall, of England, always combined 2 lbs. of bean meal with the ration for his cows, on account of its richness in muscle-forming and bone-renewing elements. We have a substitute for this in new-process linseed meal, and it costs less to us than bean meal does to the English farmer. The following ration for dairy cows will be in every way satisfactory: 2 lbs. new-process linseed meal; 2 lbs. wheat middlings; 3 lbs. corn-meal and 4 to 6 lbs. of hay to be eaten with it. This will cost 10 cents besides the hay per day; whilst any respectable cow with this ration, will produce from 20 to 25 cents' worth of butter per day; besides, it assists to put her in good condition for wintering. In feeding for milk, variety of food should always be considered. I will give suggestions for Winter feeding of stock in another article.

Miscellaneous.

RURAL BRIEFLETS.

THERE is no better time than the present for planting blackberries, raspberries and currants. Cut the first two back nearly to the roots, leaving only two or three inches of stem; set them in mellow soil; pack the earth firmly over the roots and cover with litter or straw as soon as freezing weather arrives. All straight stems of the currant plants of this year's growth may be left. Grape-vines may also be planted now. Unless the ground is rich and in every way suitable, trenches should be dug not less than five feet either way by two in depth. Fill in with sandy loam and manure of any kind. Then set the vine firmly, having spread out all of the roots, and cover with hay or straw after cold weather has fairly set in—not before. It is always better to provide stakes or trellises before the vines are planted. We would also remind our readers that if they intend to make new plantations of small fruits of any kind *in the Spring*, there is no better time than now to prepare the plots. The days are pleasant; work is a pleasure, and farm work is no longer pressing.....

A few weeks ago, one of Dr. J. B. Lawes's articles, written for this journal, appeared in the Mass. Ploughman without credit. We alluded to the oversight in a letter to the editor, whereupon the Ploughman publishes the following explanation:

☞ The very valuable article written by Dr. J. B. Lawes, which appeared in the Ploughman of Sept. 3 should have been credited to the RURAL NEW-YORKER where it originally appeared. The article was copied into the Ploughman from one of our exchanges where it did not appear as original, accordingly due credit could not be given.

In the course of every year, we see many RURAL articles appropriated by other journals; and always with regret, not alone because we have been defrauded of what belonged to us just as much as the very name of our journal; but because ostensibly respectable papers setting themselves up as moral teachers and condemning right freely the shortcomings of others, should themselves be guilty of this lowest species of pilfering.....

OVERSIGHTS do occur among the most conscientious journals, as in the case of our respected contemporary the Mass. Ploughman; for the managing editor cannot *always* give personal attention to every department. But he is always ready to make a correction or to give due credit as soon as he ascertains to whom it belongs.....

FOUR or five years ago, as we remember, we raised half a dozen plants from seed of the Eucalyptus globulus which was then first talked of as the great Australian Fever Gum Tree. One plant—about five feet high—was exposed to frost of three or four degrees and the consequence was that it died. Still the tree is commended as one not only suited to the Southern and Middle, but for the Northern States.....

MR. A. M. PURDY writes to us that he has grown the Naomi Raspberry for 12 to 14 years and that he *knows* it and "Lost Rubies" to be one and the same. We have always had the Naomi, but Lost Rubies has not yet fruited, so that there has been no opportunity of comparing them together.....

LOST RUBIES and Shaffer Raspberries were received from Chas. A. Green, May 9th. Both have made a sturdy growth, the canes of the former being purple; those of the latter green.

.....

MR. GREEN says that he is propagating the largest raspberry in the world—Shaffer's Colossal. The canes are colossal also, other varieties appearing like dwarfs in comparison. It throws out strong branching roots like a sapling. He challenges the world to show a raspberry averaging so large. We presume that Shaffer and Shaffer's Colossal are the same.....

FROM a personal correspondence between two noted swine breeders we copy the following: "In a recent agricultural journal the inquiry is made as to the relation of dished faces and heavy jowls to well marbled meat in Berkshires. My impression is that heavy jowls indicate a disposition to lay on fat apart from the lean meat. Am I right?" He is answered as follows: "I think you are right in regard to heavy jowls. Those Berkshires with thinner jowls make the best hams, shoulders and bacon—lean, tender, juicy meats mostly—very little fat. Heavy-jowled swine make fatter pork, etc. I used to breed the lighter jowls in preference to the heavy, and from them have had hams weighing 20 pounds or more, very sweet, tender, and juicy with a rim of fat round them not over half an inch thick. Such are the *most profitable* for consumers, and they are most readily sold in market at an extra price.....

THE RURAL has received many favorable reports of the Washington Oats and many unfavorable ones. They seem to have smutted more than other kinds. Summing up the evidence of these reports and adding our own, we should say that the Washington Oats are no very decided improvement upon old, well-tried kinds.....

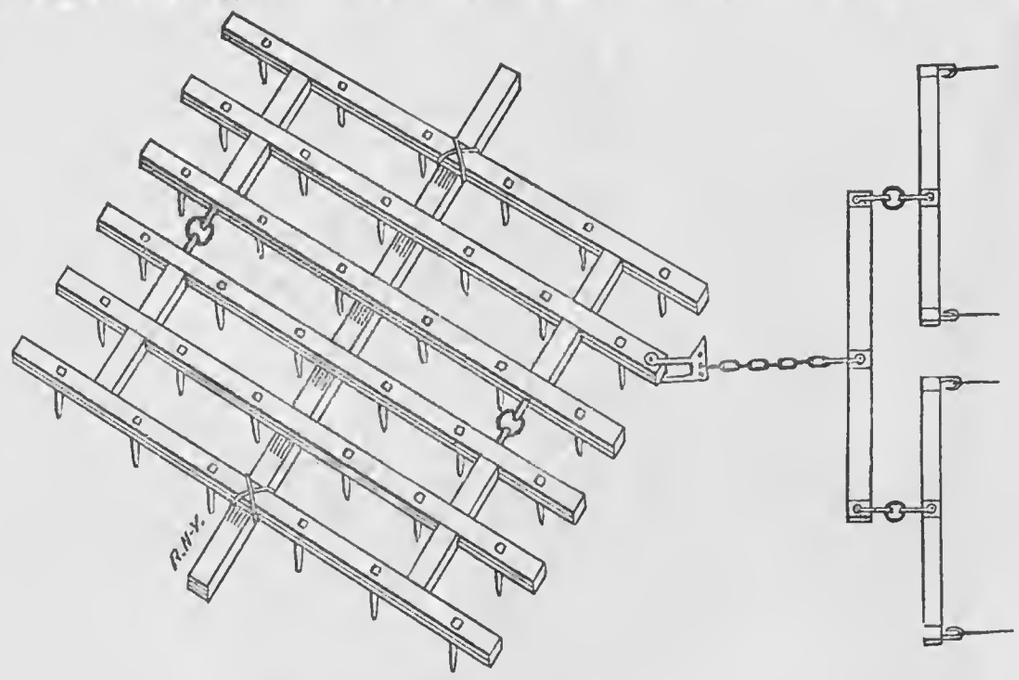
OWING to the drought our potato tests are not worth reporting—those, we mean, made at the Rural Farm. Those at the Rural Grounds (New Jersey) were satisfactory and will be reported in due time. Six kinds of new seedlings from Mr. E. S. Brownell; four from Mr. Frank Searle; several from B. K. Bliss & Sons, fifteen or twenty single potatoes from various subscribers were all cut to single eyes, carefully planted and staked. But the results need not be reported.....

WE may now report more definitely as to the "Cuban Queen" Watermelon extensively advertised and sold by W. Atlee Burpee & Co., of Philadelphia. We planted two hills April 29, using one shovelful of muck, wood-ashes and hen manure mixed together. The first and largest melon ripened Sept. 8, and measured 20 inches in length, 11 inches in thickness, and weighed, as we have stated, 27½ pounds. The flesh is a bright red in color, sugary, tender and excellent, extending to within three-quarters of an inch of the skin. The skin is irregularly and broadly streaked with whitish and dark green similar to the citron watermelon. The seeds are a dark brown. Each vine bore three melons varying greatly in size and shape, some being as round as an apple. But all were sweet and "thin-skinned," as is said when the colored or edible flesh extends to within an inch of the rind....

THE immense benefits gained by humanity at large from the improvements of all sorts in modern agriculture, are due chiefly to two grand sources. One, the establishment of freedom and equal rights on this broad continent of unoccupied soil, which has attracted people from all nations and provinces, who, by their intercourse and observation of each others' ways and procedures, have gradually rubbed off the blinding superstitions and false prejudices which had fettered all more or less. This has opened the way to belief in the possibilities of better ways than those trodden of old.

The other is the modern press and Post Office which not only enlarge the village interchange of opinions and experience to the limits of the nation, but take into weekly consideration the discoveries, and new sources of advantage developed in any and every civilized country of the whole wide world.....

SOME topics will for a time take the lead in arresting attention and exciting discussion in this universal arena of agricultural inquiry. Some, again, of extreme importance, will seem to be for a time neglected. Such is, perhaps, the great interest of sheep husbandry. It is easy to prove, in presence of a thriving flock of sheep that there is no sort of stock so profitable upon a farm. But in spite of extreme hardiness, there are many flocks that do not thrive but the reverse. One of our English exchanges, "The Live Stock Journal," commends Mr. A. M. Garland's remarks at a recent convention of sheep-breeders at Philadelphia, as touching a point vital to this interest. He said: "Many errors creep into print through the attempt of empirics to supply the demand coming from every section of the country for practical information relating to sheep husbandry. The ill effects of these can often be traced in fields whence better results would have ensued if those best qualified to teach had done what they might have done in that direc-



PULVERIZING HARROW.—SEE PAGE 710.—FIG. 492.

tion. . . . Let each flock-owner do what he can by way of contribution to our literature through such channels as are open to him. It is to your interest as wool-growers that you let your lights shine. If you know anything that by possibility may benefit your fellow-flock-owner, tell it to him. If you are doubting, seek his counsel; and, ninety-nine times in a hundred, you will get sympathy and assistance, in addition to good advice. If you are the victim of any prejudice— if you are running in a groove—get out of it. Find some higher stand-point, and you will discover, if you have not hitherto realized it, that there is more in your chosen industry than you or I have yet dreamed of."....

THE Washington Department of Agriculture is sending out a number of different kinds of Wheat:

RICE WHEAT is a beardless, reddish amber of medium-sized grains from Frederick Co., Maryland. It is said to be a vigorous grower, hardy and ripens early.

GERMAN AMBER WHEAT is said to have originated in Germany. It is said to be comparatively rust-proof and to yield well and make excellent flour. It is beardless and the berry is small.

CHAMPION AMBER WHEAT.—This is a beardless variety from York Co., Penn. It is said to have stiff straw, to be hardy and to yield well. It has a medium-sized grain of an amber color.

DALLAS WHEAT is a smooth, amber variety especially adapted, it is said, to those sections of the South where rust prevails. It ripens early and is said to be as nearly rust-proof as any good wheat in cultivation. It is an amber wheat and the kernel is of medium size.

LEMON WHEAT.—This is a beardless kind of medium size or rather small grain, from York Co., Penn. It is said to yield heavily and to bear stiff straw.

BENNET WHEAT. — Small, amber kernel; bearded head. From West Virginia. It is said to have stiff straw and to ripen with Fultz and make good flour.

WASHINGTON GLASS WHEAT.—This is a beardless kind from Cumberland Co., Penn. It is said to be a strong grower and to yield well. The grains are of a light amber color and of good size.

What Others Say.

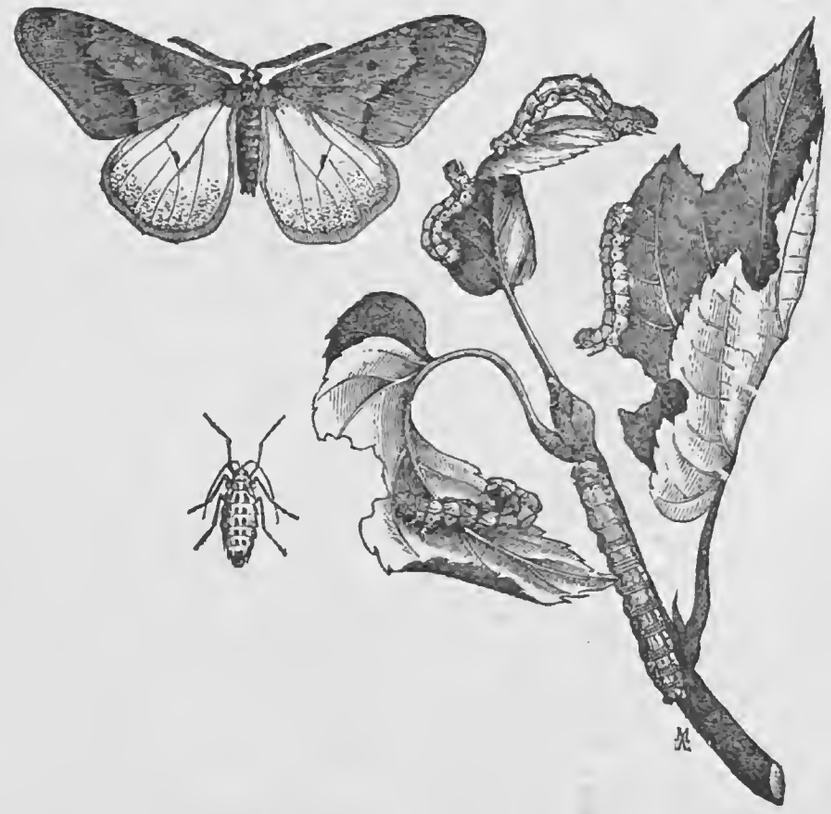
A VETERAN'S CHEERY AND CHEERING WORDS.—Marshall P. Wilder concludes his stirring address delivered before the Eighteenth Session of the American Pomological Society, as follows: "In conclusion, gentlemen, let me express again the great gratification that your presence affords me, here in old Boston, here at my old home, where, ere long, I shall cast off the thread bare covering of humanity, where this worn-out frame and this tired brain shall rest under the shadow of mine own trees in yonder cemetery. But while my life is spared, my earnest prayer will be for the perpetuation of our Society and the diffusion of its blessings to mankind. One after another of our friends will fall by the wayside, and ere long all of its founders will have joined those who have gone to that better land where fruits are immortal and whose harvests are eternal. But the progress of American pomology, rural economy, domestic comfort, and cultivated taste, which has been developed by our association, will continue its glorious march until all shall realize that fruits are one of the most beautiful emblems of Divine beneficence—one of the most perfect and useful gifts of God to man."

SAVING SEED CORN.—A writer in the Prairie Farmer picks his seed corn and hangs it up in the smoke-house and smokes it just as he does his meat. He builds a good smoke every day until both corn and cob are perfectly dry. He is not afraid of getting it too dry, he says. It must be kept in a dry place until planting time, and where there is plenty of air. He is careful not to let it heat in the shock before getting it hung up. When the weather is warm, corn will heat in a heap so as to injure the germ. He has saved his seed corn in this way for the past 20 years, and it never fails to grow.

JARRING FOR THE CURCULIO:—Mr. J. J. Thomas says (Albany Cultivator) he has had annually large crops of plums for the past 15 years by the jarring process, the only harm which has come from it being that too heavy and unthinned crops injure the vigor of the trees. From about 30 trees, the man who did the work this year caught and destroyed from 300 to 400 curculios a day for a few days, after which they were rapidly reduced in numbers. The most difficult fruit to protect is the nectarine, but no difficulty has occurred in securing loaded crops by the process he has employed, including the insertion of iron plugs to strike on with a heavy hammer, which brings down every beetle with the first blow.

SURFEITING LAND WITH FERTILIZERS.—Mr. C. S. Reed, who, it will be remembered, was one of the Royal English Commission to look into our agriculture, says of concentrated fertilizers, that continuous grain growing by their aid will not long succeed on some stiff soils. For two years the dressings answer well, but in the third they seem to lose their efficacy, and the land shows signs of being tired of grain growing. The Springs of the last few years have been cold and wet in England, and the most valuable portion of the nitrogenous fertilizers may have found its way into the nearest rivulet. But when the season has been favorable he finds that the land refuses to answer the whip as it does at first. The straw not only grows weaker, but a great deal turns white before it ripens, and produces hardly any grain; while, if the dressings are increased, the straw is flaggy and weak, and is sure to lodge with the first pelting rain.

ORCHARDS IN MICHIGAN.—The almost fabulous prices at which well developed fruit farms have exchanged hands in Western Michigan have led many to believe that it requires a large investment to enter the realm of successful fruit culture, says Sec. Garfield, in our esteemed contemporary, the Michigan Farmer. It is only in cases where orchards have come into successful bearing and are returning a large income that the lands command extravagant prices. The fruit region of Michigan is extensive, and only a small part of the land available for the production of even the more tender fruits has been improved. As good locations can be secured to-day at rates varying from ten to twenty-five dollars per acre as those which have changed hands at from $200 to $1,000 per acre after the plantations were in full bearing.



LIME TREE MOTH.—SEE PAGE 710.—FIG. 493.

TRANSPLANTING.—As the season for transplanting has arrived, we give the following account of how the operation had best be done, from a late catalogue received from Ellwanger & Barry, of Rochester, N. Y.:

1st. The Preparation of the Soil.—For fruit trees the soil should be *dry*, either naturally or made so by thorough drainage, as they will not live or thrive on a soil constantly saturated with stagnant moisture. It should also be well prepared by twice plowing, at least, beforehand, using the subsoil plow after the common one, at the second plowing. On new, fresh lands, manuring will be unnecessary; but on lands exhausted by cropping, fertilizers must be applied, either by turning in heavy crops of clover, or well decomposed manure or compost. To ensure a good growth of fruit trees, land should be in as good condition as for a crop of wheat, corn, or potatoes.

2d. The Preparation of the Trees.—In regard to this important operation there are more fatal errors committed than in any other. As a general thing, trees are placed in the ground precisely as they are sent from the nursery. In removing a tree, no matter how carefully it may be done, a portion of the roots are broken and destroyed, and consequently the balance that existed in the structure of the tree is deranged. This must be restored by a proper pruning, adapted to the size, form and condition of the tree, as follows:

Standard Orchard Trees.—These, as sent from the nursery, vary from five to seven feet in hight, with naked stems or trunks, and a number of branches at the top forming a head. These branches should be all cut back to within three or four buds of their base. This lessens the demand upon the roots, and enables the remaining buds to push with vigor. Cut off smoothly all bruised or broken roots up to the sound wood. In case of older trees of extra size, the pruning must be in proportion; as a general thing it will be safe to shorten all the previous year's shoots to three or four buds at their base, and where the branches are very numerous some may be cut out entirely.

3d. Planting.—Dig holes, in the first place, large enough to admit the roots of the tree to spread out in their natural position; then, having the tree pruned as above directed, let one person hold it in an upright position and the other shovel in the earth, carefully putting the finest and the best from the surface in among the roots, filling every interstice, and bringing every root in contact with the soil. When the earth is nearly filled in, a pail of water may be thrown on to settle and wash in the earth around the roots; then fill in the remainder, and tread gently with the foot. The use of water is seldom necessary, except in dry weather, early in Fall or late in Spring. Guard against planting *too deep;* the trees, after the ground settles, should stand in this respect as they did in the nursery. Trees on dwarf stocks should stand so that *all the stock* be under the ground, and *no more*. In very dry, gravelly ground, the holes should be dug twice the usual size and depth, and filled in with good loamy soil.

4th. Staking.—If trees are tall and much exposed to winds, a stake should be planted with the tree, to which it should be tied in such a manner as to avoid chafing. A piece of matting or cloth may be put between the tree and the stake.

5th. Mulching.—When the tree is planted, throw around it as far as the roots extend, and a foot beyond, five or six inches deep of rough manure or litter. This is particularly necessary in dry ground, and is highly advantageous everywhere, both in Spring and in Fall planting. It prevents the ground from baking or cracking, and maintains an equal temperature about the roots.

6th. After Culture.—The grass should not be allowed to grow around young trees after being planted, as it stunts their growth and utterly ruins them. The ground should be kept clean and loose around them, until, at least, they are of bearing size.

SNAILS AND TRUFFLES IN FRANCE.—The trade in snails and truffles in the Paris markets is enormous, and something that the outside world can scarcely understand. It is stated that about 90,000 pounds of snails are sent to the Paris market daily from the gardens of Poitou, Burgundy and Provence, where the breeding of this mollusk is made a specialty. The natural delicate flavor of their flesh is improved by feeding them on aromatic herbs. In other parts of France truffles are produced in vast quantities, and the total value of the entire product is estimated at from 18,000,000 to 20,000,000 francs. Neither of these industries has as yet been introduced into this country. Snail culture might be readily undertaken, but the propagation of the truffle is as yet somewhat of a mystery.

HANDLING APPLES.—The Maine Board of Agriculture concludes a bulletin as follows: Fruit growers may reasonably expect fairly remunerative prices for all the apples they can put upon the market in good order. Pick before heavy frosts, and before over-ripening, handle with *extreme care*; store in cool cellars, and guard against extremes of temperature By observing these precautions they may be kept, if desired, till late in the season without loss, or till the trade calls for them.

THE APPLE CROP.—It also says that the apple crop in Maine the present season is a bountiful one. In those counties not especially adapted to fruit growing, there is no more than an average crop, and in some localities it falls below; but in the great fruit-growing belt of the State—Western York County, Cumberland, Oxford, Androscoggin, Franklin and Kennebec—the crop is abundant. Throughout this belt, with limited local exceptions, the Baldwin is the leading variety grown. In many towns there will be more of this variety harvested than ever before in one season. In Sagadahoc, Knox, Waldo and Southern Penobscot the crop is a full average, but the Baldwin does not lead to the extent that it does in the counties first named. The apple crop in the great fruit-growing States outside of Maine is a light one. Michigan, through its highest authority, reports "the shortest crop in many years." Such is the scarcity in Illinois that "they are now selling for four to five times their usual price." In New York the crop reports to the State Agricultural Society give apples "a light crop," "a very light crop," and in seven of the best fruit-growing counties "almost no crop." An extended trip through the best apple sections of Massachusetts found the trees almost barren of fruit.

THE Society of Public Analysts of Grea Britain and Ireland have adopted as a standard for the poorest pure milk, 9 per cent. of solids minus fats, and 2.5 per cent. of fats—a total of 11.5 per cent. of solids. There is little doubt that milk containing less than this percentage of solids is watered or skimmed.

RELATIVE COST OF CORN AND PORK.—When corn is worth 30 cents per bushel, it pays to convert it into pork, if the latter sells for $3 per 100 pounds. With corn at 40 cents, pork should sell at $4 per 100 pounds; corn at 50 cents, pork $5; and so on, adding $1 to pork for every increase of 10 cents per bushel in corn. This is the estimate placed on the relative prices of these two articles by the Prairie Farmer. If the pork sells for less than is represented by the corresponding price of corn it is fed at a loss; if more, the advance is profit —in each case regarding the manure as pay for the trouble.

A LONDON paper says, as to the term "cornering:" "We are greatly indebted to our American cousins for supplying us with terms which express in one word the meaning of half a dozen sentences." . . . . . Clare Sewell Read thinks every farmer who makes even the roughest experiments should give the results to the public, stating faithfully failure or success. . . . . Some men make you feel as though the warm sun had just broken through the clouds, while others make you feel as though a sudden east wind, with its arms full of a cold fog, had caught you with too thin clothing on. . . . . Sample copies, posters etc., of the RURAL NEW-YORKER will be sent free to all who apply. Let all who can do it without telling a story, speak a good word for the RURAL. A good word is the next thing to a subscription. . . . . Why not eat woodchuck? It is a cleanly creature that feeds on clover and similar forage. A New-Yorker who entertained this view invited some friends to dine, and served them with meat of this neglected farm stock, prepared in different ways, and they, not being prejudiced by knowledge of the character of the repast, pronounced it, "delicious."—Food and Health. . . . . Mr. John A. Phelps of Conn., according to The Farmer of that State, inculcates in his boys a love of country life and the paternal acres in this way —which is as sensible as it is effective: "He rents them plots of ground for potatoes and tomatoes; sells them manure to enrich their crops, taking pay in labor; teaches them to make their own sales, keep their own accounts and carry their own 'scrip' etc., etc."—N. Y. Tribune. . . . . Speaking of Venus's Fly-Trap (Dionœa muscipula) Dr. Thurber tells the following: "The sashes of the green-house, in Summer, are, of course, open, and insects of all sorts get caught in the Fly-traps The other day a "potato-bug" tried it. The rascal was caught, but though it gnawed a hole through the fly-trap, I am glad to say that it did not get out. Dionœa was quite too much for Doryphora. Still the catching of such big insects seems to exhaust the Fly-trap, and after a leaf has caught one, it loses its sensitiveness. . . . . Unfortunately, the trade in chemical manures is not confined to honorable houses, says a noted Frenchman, M. Marchaud, and therefore your self-interest dictates that you should be especially careful not to imperil your success by purchasing manures which unprincipled dealers offer under imposing titles and perhaps even false descriptions, with the intention of deceiving you, that they may thereby enrich themselves. . . . . J. K. Hudson has resigned his position as Secretary of the Kansas State

Board of Agriculture. Mr. F. D. Coburn has been elected to fill the vacancy. . . . .

A set of rascals in Chicago have been palming off rotten fruit upon poor people, at low prices, under cover of a nice-looking layer of sound fruit on top of the basket and a gauze netting over all. . . . . A dollar invested in wheat-middlings will pay for 100 pounds, and this will feed a calf a long time, and really add double its cost to the value of the young animal. So says Col. Curtis in the N. Y. Tribune. . . . . Another writer in the same journal says that he is of the opinion that the coming harrow will not be a harrow at all, but a cylinder armed with strong curved knives or teeth revolving at considerable speed, and it is not unlikely that the same implement can be easily and quickly converted into a roller. This, of course, only applies to Western farms where the fields are free from stone and stumps. The spring-toothed harrow is a very good implement but too expensive. Another Western tool that answers a good purpose is called the Jack-plane harrow, a better implement than the spring-tooth, but, like it, too costly—$25. . . . . Elderberries are not so named because they are any older than any other berries. They derived their name from the fact that an elder of a church first discovered their color by sitting down upon a bunch of them at a picnic.—Afloat.....Brudderly feeling goes a good way in case of sickness, or want, or death, but it seldom reaches down to a hoss trade.—Detroit Free Press via N. Y. Tribune. . . . . Mr. Randolph Peters, the experienced nurseryman of Wilmington, Del., says that in the future for Maryland and Delaware he should plant dwarf pears rather than standards. In those States they have been found to pay better.

Everywhere.

NOTES FROM KANSAS.

I AM living in the southeast corner of Douglas County, Kansas, where I first "pitched my tent" in 1860, since which time vast changes have been wrought. During this time I have passed through droughts, grasshoppers, chinch bugs, the civil war, etc., but in spite of all these seeming drawbacks in the past, I love my adopted State no less than when I first landed here in the then Territory of Kansas.

Disasters are not, as a rule, as great as they at first appear, and hence in regard to our State, although we would not claim grasshoppers to "be a blessing in disguise," yet their advent "played out" the noxious weeds, and the ground seemed to have absorbed a fresh store of plant food from the atmosphere, and we had a succession of fruitful seasons. Neither have chinch bugs done much damage since then, in fact they "quit" about that time and only in the last year or two have they been around much. Our dry weather is generally from the middle of July to the middle of August. The last few years our rains here have come about the 19th or 20th of August; hence we usually have a good growing season for crops before the dry spell, and our practical farmers are learning to plant so as to secure the maturity of their crops as early in the season as possible, or else to postpone planting such things as late potatoes, sorghum, etc., so as to have them grow and perfect themselves after the Fall rains and before the killing frosts. On the uplands, a killing frost does not usually occur before the 17th of October; but on the bottom land "truck" is usually "cooked" two weeks sooner. The pastures get very dry here during the "heated term." D. R. Locke says the grass is greener in England than in America and I am inclined to the opinion that during midsummer, this greenness of the grass grows gradually less as one journeys westward across the continent.

But in spite of all that could truthfully be said against this State, her course is onward to future greatness and increasing prosperity. She is situated near the center of the continent and the transportation of all her products to the the sea-board is somewhat against her; but this matter is measurably overcome by converting the corn into pork and beef. This is the money-making business of the country.

Our "feeders" who buy up their feeding cattle during the Fall—who raise their own pigs and make a business of getting as many pounds of flesh as possible upon the animals in the shortest time and at the least cost, are the thrifty farmers, as a rule. But they add also to the prosperity of others. They feed large quantities of corn besides what they raise themselves, and they buy up all the scattered stock through the county, for which they usually pay good prices. But this year it is thought that there will not be more than one-third of a crop of corn in this part of the State, and hence our "feeders" are slow about engaging largely in the business. Now corn will be worth 45 to 55 cents per bushel, and hence the cattle to feed on corn at that price would have to be bought "right" in order to secure the usual margin of profit.

Douglas Co., Kansas. M. A. O'N.

RURAL SPECIAL REPORTS.

Idaho Territory.

BLACKFOOT FARM, Oneida Co., Sept. 26.—When I first subscribed for the RURAL NEW-YORKER, it was the seeds I wanted, but now since I have become acquainted with the paper, it is the paper first and the seeds next. I am satisfied that those having the success of the best interests of our great and glorious country at heart, should do all in their power to advance it and promote its usefulness. As regards the seeds, I received all in due time except the white Elephant Potato, which was not received until about May 10. Not being ready for the others, I planted only the Branching Sorghum, the Washington Oats and the White Elephant Potato. The first I planted, I believe, too early, for only one seed came up: it grew, but turned out small and of no importance. I think the soil and climate are not suitable for it here. The oats grew splendidly and I think will prosper here, but the rust almost entirely destroyed those I planted. The White Elephant Potato had 12 eyes. I planted them separately on May 12; 10 came up and grew very thriftily, except four which, compared with the others, were rather feeble. I dug them September 12 and got 79 tubers; 40 were marketable, one weighed 2¼ pounds; the others were from the size of a hen's egg down to the size of small marbles; all weighed 31¾ pounds—I think an enormous yield. The land was well manured and well watered by irrigation. P. B.

Illinois.

CHAMPAIGN, Champaign Co., Sept. 27.—Since the 10 hours' rain on the 15th inst. we have had several light showers, but hardly more than enough to lay the dust. But it has been raining north, less copiously south and the indications seem to be we shall be approached from both sides and deluged with several downpours. But I have no expectation of a wet Autumn and hardly think we shall see much more rain this side of the Autumn equinox than we had upon the other. But as moderate as they have been, the late rains have done a world of good in helping out the corn crop, in softening the soil so it could be seeded and in germinating the newly sown wheat. Besides, the pastures and meadows have been freshened up and where the soil has not been too much impoverished the sward has become a mass of living green. But still the creeks are not increased, the sloughs are dry and all but the best (say 25 per cent.) of the wells of the country, afford no water. Nor will they till from three to six inches of rain have fallen within a limited time. Nothing but actual experience can afford an adequate idea of extra work, trouble, anxiety and money loss, involved in a drought such as the farmers of the south two-thirds of Illinois have passed through since early July; even if we consider only so much of these as a scarcity or failure of water insures. Think of having from seventy-five to a hundred head of stock and half as many hogs to furnish water daily for; when sloughs are dry, wells giving out, creeks five or six miles off, pastures short, the sun shining through a sky of fire, the mercury ranging from 80° at sunrise to 95° and sometimes 100° at noon, and this continued for weeks without interruption—and consider, further, that water enough having been secured for one day, the same task had to be done the next, with the reasonable fear that water cannot longer be had, the animals must be sold, or, if kept inclosed, they will die, or turned out, wander away in search of water. Though the crop losses in Illinois from the drought have been confined mostly to the thin, light-colored soils south of the general direction of the old Terre Haute and Alton Railroad, the stock losses from shrinkage and enforced sale from water scarcity have been half as large, and possibly more. After such enormous losses in the grain and cattle States north of the Ohio and Missouri Rivers, to which must be added the failure of the cane crop in the Cotton States, and a decrease in the cotton yield from 25 to 35 per cent., the total of which will reach several hundred millions, it cannot be otherwise than the business of the country will feel these in a very marked way and perhaps new fashion. Meantime in the Chicago market, the advance over this time last year in the five leading cereals, has been equal to an average of 48 per cent., the date being Sept. 24. Thus wheat has advanced from 90⅝c. to $1.31½, or 45 per cent. Corn from 39⅜c. to 68c.—70 per cent. advance. Oats from 29c. to 41½c., or 43 per cent. advance. Rye from 82c. to $1.09¼, or 33 per cent. advance, and barley, from 75c. to $1.13½, or an advance of 50 per cent. In regard to the character of next Winter there is nothing to prophesy about it, the whole matter of a cold or warm Winter being a question of a less or greater amount of rainfall absorbed in the soil or lying on the surface. If the first condition obtains (in the Mississippi Valley) over one or two hundred thousand square miles, the Winter will be dry and very cold; if the second, that is, if the ground is saturated with water, the Winter will be a moderate one. B. F. J.

Iowa.

MAGNOLIA, Harrison Co., Sept. 28.—The Washington Oats I put into rich ground and they broke down, but I will have a quart of seed. From the White Elephant Potato I get 38 good-sized tubers and it must be remembered that in Western Iowa we have suffered dreadfully from dry weather. Potatoes are selling for $1 to $1.25 per bushel now. My asparagus has grown finely and I will have a fine bed next year. My wife's pink seeds were a failure. Wheat yielded only four or five bushels per acre; oats good; corn half a crop. O. V. B.

Kansas.

WHITING, Jackson Co., Sept. 29.—A very dry Summer. RURAL seeds well attended to, but only to see them burnt up along with the rest of the garden "truck." Rye good; wheat rather light; corn poor. Rye, $1 per bushel; wheat, $1.25; old corn, 50c.; new corn, 35c.; potatoes, $1. J. E.

Michigan.

CARO, Tuscola Co.—We live in the burnt district and have saved nothing but our house, and feel heart-thankful for a shelter. Pen cannot describe the scenes of misery which prevail. Many are now dying from "gangrene," the flesh dropping from the bones. L. P. R.

LITCHFIELD, Hillsdale Co., Sept. 28.—The drought still continues, though on the 9th, 10th and 27th we had some fine showers—enough to to make wheat sowing pleasant. Late corn will be very light. Wheat makes a better yield than expected, judging by the straw. My Branching Sorghum grew finely; was seven feet high. I cut some off in July and it is now three feet high again. My White Elephant Potato I cut to single eyes. I have 27½ pounds of as nice tubers as I ever saw. I also planted one pound of Mammoth Pearl—very fine tubers—and got over half a bushel. I must say that I am very highly pleased that the RURAL takes such a deep interest in the welfare of the farmer. I hope the farmers will take an interest in keeping the RURAL flourishing. May it have a long, pleasant life. I had the Russian White Oat this year, but it did not yield as heavily as some of the advertisements promised, though it grew large and looked very fine. G. K.

ST. LOUIS, Gratiot Co., Sept. 26.—I cut the W. E. Potato into 14 pieces of one eye each, and planted one eye in a place 22 inches apart in the row, in good garden soil. The vines grew very strong, promising a big yield. The crop counted 90 tubers, 60 of which were fair-sized. Weight of crop 24 pounds. The same number of eyes of the Beauty of Hebron gave 22 pounds, planted in the same manner and beside the W. E. The Washington Oats grew finely, without smut or rust, but yielded only six pounds of tolerably fair grain. The R. B. Sorghum—what we did not cut early—now stands 7 feet high. Nearly every seed grew and branched out prodigiously. Our cow pronounced it excellent feed. I think her judgment good. The second growth is about two feet high. The asparagus has grown finely, but I can see no difference in the two kinds. Our Spring was wet and cold; our Summer dry and hot. Corn a good crop, but potatoes light and selling at 80 cents per bushel. Wheat was light, but oats good, and selling at $1.30 and 40 cents respectively. Butter, 28 cents; eggs, 15 cents. Our county is comparatively new: flat or gently undulating, and heavily timbered with beech, maple, ash, oak, some pine, basswood, elm, soft maple, etc. We get flowing wells of excellent water at a depth of 40 to 200 feet. I feel like complimenting the RURAL on its great improvement since removing to New York. Father was a subscriber to the old Genesee Farmer of Rochester, and later to the RURAL under D. D. T. Moore, and it came to us regularly till it went to New York City, "us" children thinking very much of its coming. I have the issue of 1853 complete, and enjoy looking the old book over occasionally, partly to awaken old sympathies and to note the difference between the old and the present manner of conducting an agricultural journal. You will find my $2.00 ready for years to come, or while I live and am able to get 2 00 cents in a pile. Success to the present administration! [Thanks.—EDS.] J. W. S.

Nebraska.

AUSTIN, Sherman Co., Sept. 22.—Other papers as well as the RURAL NEW-YORKER, contain so many complaints about dry weather, that it occurs to me to give an account of the rainfalls here: June, 10 rainy days; July, 10 days; August, four days; Sept, four days to date. Among these four the rainfall on the 6th was the heaviest during the whole year. J. B. N.

New Jersey.

MARKSBOROUGH, Warren Co., Oct. 3.—The W. E. Potatoes have done very well, although it was too dry for potatoes. I got 17 eyes out of the two small potatoes sent me, and planted a single eye in a place and got 16½ pounds of nice-sized tubers. I sowed the Washington Oats in my garden; there were quite a number of smutty heads, but the grain was fair, the straw medium-sized and the yield 8½ pounds. The R. B. Sorghum did not do very well; it came up very poorly and did not make any growth. P. W. S.

New York.

AUSABLE, Clinton Co.—All the RURAL seeds were planted in my garden—heavy, stony ground, manured lightly every Spring with barnyard manure plowed under. The R. B. Sorghum seeds did not come up, unless the grubs took them before I could see them. The Asparagus seeds all grew. The plants are looking fine. The oats came up well, and grew very fast until ready to head; then it was too dry and they had to wait a while, and rusted badly, and there were a great many heads of smut. I let the hens harvest them. My potato I cut into 18 pieces and planted them on May 9. They got no extra care, but were sprinkled twice with Paris-green and plaster to keep off the bugs. I dug them Sept. 20, and got 153 tubers; one weighed 25 ounces; 30 of them weighed 29¾ pounds, and they all weighed 65¾ pounds. Who beats my elephant? The flower seeds did nicely. My wife and sister say they are splendid. S. H. C

CATO, Cayuga Co., Sept. 29.—It has been very dry here the past season, but the RURAL seeds have done well. The White Elephant Potato was planted May 13th, 25 eyes making 25 hills; 24 grew. I dug them Sept. 1; had 73 pounds of nice tubers, the 13 largest weighing 10 pounds; one weighed 1¼ pound. The asparagus is doing nicely; it is 15 inches high. The Washington Oats were partly destroyed by hens, but I have four quarts of nice seed, The R. B. Sorghum is making a nice second growth. I have left a dozen hills which I think will mature seed if frost holds off 10 days more; it is nearly in the dough state now. The flower seeds were not sown this season.

I have been testing the Amber Cane this year. I planted 24 square rods. Mr. Charles Kellogg, living about a mile from me, tried it last year, using an old feed-cutter for a crusher, which did not get half the juice. This year he has 60 square rods and has purchased a three-roll Diamond Mill of Geo. L. Squiers & Bros, of Buffalo, N. Y. The first day he crushed out 200 gallons of juice. He had altogether 340 gallons of juice which made 54 gallons of nice molasses. From my 24 rods I got 22 gallons, worth 80 cents per gallon. Several farmers will plant Amber Cane largely next season as it has proved a success with us. I followed your example and planted my corn in drills, using an Albany planter, dropping the kernels 10 inches apart; the result is I have a heavy piece of corn, well eared, while corn in hills is less than half a crop. J. K. R.

GRAFTON, Renns. Co., Sept. 27.—I planted 28 nice White Elephant eyes in ordinary garden soil, May 7, with no other manure at planting than a spoonful of Lister's Superphosphate to each piece. They were placed 18 inches apart in rows three feet apart. They soon came up, were hoed and watered three times with liquid manure dipped from depressions in the barnyard during the fore part of the season, and once with a weak solution of potash. I dug them Sept. 26; the heaviest yield from one piece or sprout was 4 pounds and 13 ounces; the heaviest tuber was 1 pound 15 ounces; heaviest 12 tubers weighed 15 pounds 12 ounces; the weight of the entire lot was 87½ pounds. Query: Is the White Elephant a white potato? I supposed it was until I dug mine, which I find to closely resemble the Beauty of Hebron in color. This latter variety sent out by the RURAL, has now been planted and harvested the third time with entire satisfaction; we consider it a great acquisition, yielding this year double what the Early Rose does alongside of it receiving the same treatment and cultivation, although with us ripening somewhat later. The Washington Oats stood about six feet high, with strong straw. They were sowed in drills in common garden soil, with no manure. There were many smut heads found, which I at first attributed to the variety, but afterwards found that not only the Washington Oats, but my other varieties in the field were badly smutted, as were also those of the neighborhood generally. After cutting, the chickens obtained access to them and destroyed many, so I estimate that from smut and chickens I lost fully one-third. I thrashed and saved 12 pounds of good heavy grain. Both varieties of asparagus came up well. I have 127 fine plants in all, but can say nothing as to the merits or

demerits of the thing, having never raised any before and knowing nothing of it. The sorghum seeds were planted, and nearly all germinated; they have made a rather slow growth. I think it hardly adapted to this climate. The Golden Rural Tomato of a former distribution is, with us, a great acquisition, it being not only earlier, but so hardy, and above all such a prolific bearer. [We have said little about this excellent tomato for the simple reason that it is yellow.—EDS.] The potato crop in this vicinity is very light. Corn an average crop. Oats heavy. Buckwheat very light, perhaps owing to the hot, dry weather. Springs and wells the lowest known for years. D. J. P.

LYONS, Wayne Co., Sept. 29.—The White Elephant Potato had 11 eyes, and I planted them in 11 hills on May 9, at the same time as Rural Branching Sorghum and Washington Oats. I planted them on clover and Timothy sod, the first row being next to a strong piece of grass—three tons per acre. This did not quite give them a fair chance. I dug the potatoes Sept. 23 and got 58 tubers—15 pounds in all; there were only three small ones; the rest were all larger than the sample sent. The price of the RURAL could not buy them. Although I have taken it for over thirty years without a break, it has never been better than now. The Washington Oats grew very nicely—no smut or rust. The R. B. Sorghum made a good growth. I am going to save all the seed to plant next year. Just in my locality we are experiencing the greatest drought we have ever had. Many farmers are sowing their wheat for the second time, and this is the very garden of Central New York. Wheat turns out better than expected; it is of good quality, though the crop is 25 per cent. short. Oats and barley good; potatoes short on account of drought; apples short 75 per cent., although one of the best apple counties in the State. Pears a good crop. Small fruits short. J. B.

PERU, Clinton Co., Sept. 29.—Crops better than last year. The drought did not last very long; but the oats were somewhat injured by it. From the package of Washington Oats I harvested five pounds. The White Elephant Potato was very small; it had nine eyes: received no extra cultivation; yielded 63 pounds. A number of tubers weighed from 1¼ to 2½ pounds. They are splendid. The asparagus seed came up finely. The pinks were very nice. M. A. H.

Nova Scotia.

WEYMOUTH, Digby Co., Sept. 24.—Wheat did not thrash out as well as was anticipated, the straw rusted slightly, and the grain was more or less shrunken. Potatoes below an average. Hay an immense crop, but a good deal damaged in harvesting. Apples, pears and plums very plentiful. Have had beautiful weather for harvesting grain this month with about enough rain for the pastures and late root crops. A frost on the night of Sept. 21, injured tender crops. I cut the White Elephant Potato to single eyes; had 20; planted them about May 10, in hills two feet apart, one eye to a hill, on a piece of low, rich land. About a week after planting a heavy rain deluged the land, leaving only the tops of the hills out of the water. Cut seed of any old variety of potatoes would, no doubt, have rotted in the hill, but out of 20 hills of the White Elephant I had 19 strong plants; the other hill came up but made a feeble growth. I dug them a few days ago and had 44 pounds of fine potatoes; the largest weighed 18 ounces; six of the largest, 5½ pounds. I have several varieties of excellent potatoes, including Beauty of Hebron, and I am satisfied that the White Elephant for a late potato is a decided acquisition. The Washington Oats were planted about one inch apart in drills eighteen inches apart, on soil of medium quality, to which was added a small quantity of rock superphosphate. The oats grew about five feet high, many of the leaves were over an inch in width. About one-third of the heads were smut; the rest splendid grain, many of the panicles having 150 spikelets. They thrashed out seven pounds. The Rural Branching Sorghum is a failure with me; the weather being cold I did not plant it until the 9th of June, on rather poor soil; but few of the seeds germinated and they have only grown about three feet high. The season was very unfavorable. The asparagus seeds were planted close to the potatoes, and at the same time; they were a long time coming up and did not all germinate. I have 150 nice plants. The flower seeds were sown in pans in the house and came up very quickly, and I think every seed germinated. When large enough they were transplanted to the garden and have been a mass of bloom for some time. We have not seen anything like them for variety and beauty. I am much pleased with the RURAL NEW-YORKER. It comes to me regularly every week, crowded with practical information, and, I may add, free of cost, as I am satisfied that the seeds alone have paid me for time and money expended. W. H. S. D.

Pennsylvania.

BERWICK, Columbia Co., Sept. 27.—Wheat hardly an average crop—not as good as last year. Corn about one-fourth of a crop. Oats good in the straw, but not so good in the grain. Potatoes not half a crop. Hay good. My Elephants did nicely for the season. I planted two quite small tubers and got 28½ pounds, some nice-sized tubers, but most were small. The weather is very dry. Everything is drying up; runs, springs and wells like the rest, and the river is the lowest I ever saw it, and I have been about it for 60 years. The grain that is in the ground and is coming up is wilting, drying and dying, and if rain does not come soon, the next crop of wheat will not be much. Prices are as follows: Wheat, $1.40; corn, 75c.; oats, 45c.; potatoes, $1; hay, $12; clover seed, $8; butter, 30c.; eggs, 20c. Business good; work abundant, and money enough to back it up. I. S.

The Querist.

ANSWERS TO CORRESPONDENTS.

[Every query must be accompanied by the name and address of the writer to insure attention.]

RASPBERRY BLIGHT.

C. W. Evanston, Ill., sends a specimen of his raspberry vines which are badly spotted, and he asks what ails them and how to treat them. Last year's vines bore some berries the past season, but were drying up and dying out; this year's vines made a growth, but they became spotted like last year's vines.

ANS.—We submitted the specimen to Mr. E. Williams, of Montclair, N. J., Secretary of the New Jersey Horticultural Society, who has devoted much attention to the matter, and he says: "This malady is no new thing to me. It has troubled my Black-caps for years, so that I had to discard them entirely. It was this same disease which was submitted to our Experiment Station last year, the result of whose investigation was published in the RURAL of June 19th, 1880, page 390. We progress very slowly in this matter. This much has been learned—that it is due to a fungus. Prof. Lockwood so stated at the Winter meeting of the New Jersey Horticultural Society, Feb. 6th, 1879, and illustrated its growth. He could not give any preventive or remedy except cutting and *burning* the affected canes. In view of the little we know regarding this particular fungus the case stands about thus: If the RURAL'S correspondent does not destroy his affected plants and the fungus with them, the fungus will destroy his plants for him to all intents and purposes, as it has done for others, and burning is the *only* remedy I know of. He can judge as to his best course. I sent the letter and specimens to Mr. Ellis, of Newfield, N. J., a recognized authority on microscopic fungi, whose opinion on the matter appeared in the RURAL of June 19, 1880, with the hope and request that subsequent examinations would enable him to give us a little more light on this dark subject. I append his reply, and remark that if, as he states, the disease does not exist in his locality, it is more than I can say of any locality I have visited this season. My observations lead me to assert that this fungus thrives under all the favorable and unfavorable conditions named, and I can conceive of no conditions of weather or temperature that seem to materially impede its progress.

I also sent an apple leaf infested with a gall or fungus, which is fearfully prevalent up the Hudson River, the entire foliage of large trees being as yellow as the yellowest of Autumn leaves, and no fruit being on any of them. I find a few leaves on some of my young trees similarly affected, and I fear its ravages since seeing it in the vicinity of Newburgh, N. Y." Mr. Ellis says:—

"The disease on the Black-cap canes is new to me. There is nothing like it here. The trouble is caused by a fungus growth which is closely allied to the production known as Ascochyta Rubi, which affects the leaves of various species of Rubus, but without producing any injurious effects, so far as I know. The fungus on the specimen sent has spores much like the above-named species—oblong, eliptical, hyaline, nucleate .0025-.0031 *m m* long by half or one-third as wide, produced abundantly in little cavities (perithecia) which are situated in the central part of the pallid spots on the affected canes. This fungus growth, if it is desirable to give it a name, might be called Ascochyta necator, being apparently quite destructive in its effects. It belongs to that class of productions known as imperfect fungi, being probably the first stage of development in the growth of some ascomycetous fungus.

"I said the trouble was caused by this fungus. That assertion needs, perhaps, some qualification. Fungi, like other plants, appear and grow only under favorable conditions of heat and moisture and, as far as the parasitic fungi are concerned, there is in general, if not always, some special condition in the affected plant which invites and promotes the parasitic growth. If a plant has become enfeebled by long-continued drought, or if its tissues have been gorged by long-continued wet weather or by over-stimulation with unfermented manures, it is, of course, much more liable to the attacks of various fungoid growths. The present season has been an unusual one, and the atmospheric influences may have been such as to start into life and active growth the germs of various organisms which might perhaps otherwise have lain dormant.

"It may be that your advice to root out the affected plants is the best that can be given. If, however, the roots are not yet seriously affected, it may be that next year they will send up a healthy growth. Past experience shows that the diseases which have at various times threatened the destruction of various crops, have after a while either passed by entirely, or lost so much of their first virulence that they are no longer formidable. Witness the potato rot, and I hope we may add in a few years, the grape rot.

"The fungus on apple leaf is Roestelia lacerata *Tul*, and is a real fungus and not insect work. It is common here. Prof. Oersted supposed that the cedar apple fungus was only another stage in the growth of this Roestelia, but this view has not yet been fully confirmed."

TIMBER-GROWING IN DAKOTA.

"*Subscriber*," *Stuttman Co., Dakota*, asks, 1, what is the most valuable rapid-growing tree for outside shelter belts in that country; 2, will the sweet chestnut do well in Dakota; 3, when is the best time to set strawberries there.

ANSWER BY PROF. J. L. BUDD, OF THE IOWA AGRICULTURAL COLLEGE.

1. Back from the river bottoms timber-growing on the uplands of Dakota will be fraught with much difficulty unless careful attention be given to the selection of varieties. In the hot, dry air and soil of that region the cottonwood and willow will prove short-lived and unprofitable. Beyond a reasonable shadow of doubt, the White Poplar, often known as Abele or Silver Poplar, should take their place in the formation of quick growing outside shelter trees on these great, storm-swept prairies. It will maintain health and make very rapid growth under conditions, as to aridity and heat, that would injure or kill most other trees. The real value of its timber for economic uses is yet little known in this country; but it has long been recognized in all parts of Europe. In reality, it is the heaviest, closest-grained timber found among all the species of the poplar genus. It has another merit in a section needing shelter belts, so badly as Dakota—viz.: Every piece of root two inches long will, in a single season, make quite a miniature tree. It also grows from cuttings of the limbs with more certainty than most of the poplars. The sprouts may become something of a nuisance on the sides next to cultivated fields, but they will amount to nothing in the dense shade of the timber belt. With the shelter of the poplars on the south and west, the Box Elder, Green Ash, Black Wild Cherry, Black Walnut, Butternut, Honey Locust, and the Hardy Catalpa can be started as time and means permit. A pamphlet of 36 pages, published by the Iowa State Horticultural Society, giving explicit instructions in the propagation, setting and management of forest trees on the prairies, will be sent to applicants who forward a three-cent stamp. 2. After providing outside shelters on the south and west, the chestnut can be grown, if the nuts be planted where wanted and protected somewhat for two years, to carry them through Winter, until they become deeply rooted. 3. In that dry country always set as early in Spring as the ground becomes in good condition for working. Keep the plants in rows and keep the ground between the rows heavily mulched Summer and Winter, in Winter covering the plants also with a light coating of prairie hay.

MAKING GRAPE WINE.

S. P., Massingford, Va., asks how to make grape wine for family use.

ANS.—To obtain good wine, good grapes are necessary. They should not be gathered when moist with dew or rain, and none but sound, thoroughly ripe grapes should go into the press. The grapes may be crushed by hand in a tub, in small quantities, and any small cider or wine press will do for pressing. After crushing put the "mare" into a tub where an equable temperature may be kept, not falling below 65 degrees. Fermentation will begin about the third day and after this has continued actively for 36 hours or so, the free juice may be drawn off, and put into a cask. The remaining "mare" must be pressed at once. When the fermentation of the extracted juice has abated so that a bung may be driven into the cask, the wine may be said to be made. When the fermentation has wholly ceased and the wine become clear it should be drawn off into another cask, and after fermentation in this has stopped, the wine may be bottled for use. After the grapes are assorted every operation should proceed rapidly, the stemming, crushing and pressing processes following in rapid succession. The wine cellar should have a considerable evenness of temperature, freedom from wetness and good ventilation so that the temperature can be changed gradually when necessary. Large casks are claimed to be better than small ones as a large body of wine will ferment more perfectly than a small one. A common house-cellar will answer the purpose for a small quantity of wine if it can be kept cool enough in Summer. A temperature of 45 degrees is then desirable.

FLOWERS AND "THINGS" FOR SAN FRANCISCO BAY REGION.

J. C. M., Mt. Eden, Cal., asks, 1, the names of a dozen silver-leaved and golden-bronzed geraniums, 2, what kind of palms would we recommend, in addition to Brahea filamentosa and Chamærops excelsa which he has now growing; 3, the names of 12 double and single fuchsias; 4, the best manure for roses and how should it be applied.

ANS.—1. Silver-leaved—Bijou, Flower o the Day, Lass o'Gowrie, Mrs. Laing, Pearl and Mountain of Snow. Golden-bronze.—Marechal Macmahon, Black Douglas, Beauty of Calderdale, Pride of Mount Hope, Count Munster and Emperor of Brazil. 2. There are very few palms as hardy as Chamærops excelsa, or judging from its native habitat, as Washingtonia filifera (the species you call Brahea.) You had better find out what kinds are grown as hardy about San Francisco. We would suggest Sabal Palmetto, serrulata and Adansoni; Chamærops hystrix, Martiana, humilis, and its varieties and Fortunei. The last named is barely distinct from excelsa. 3. Single—Earl of Beaconsfield, splendens, Spitfire, Lord Byron, Covent Garden White and Improvement: Double—Mrs. H. Cannell, Tower of London, Snow Fairy, Alpha, George Peabody and Prince Leopold. 4. Farm yard manure, and in quantity according to the condition of your ground and vigor of your plants, bearing in mind that Roses are gross feeders.

RAISING BALSAM FIRS FROM SEED.

P. R. L., Kalamazoo, Mich., asks how to raise Balsam Firs from seed. Last Fall and again this Spring he planted some, having soaked some of the seed and put in the rest unsoaked, but only a single plant came up, and he would like to learn the cause of the failure.

ANS.—Not knowing the method pursued in sowing the seeds, we cannot say why they failed. It is very likely, however, that the seeds were imperfect. The seeds being sound, one should have reasonable success by sowing in shallow boxes in a sandy soil, covering the seeds about a quarter of an inch deep, watering as needed, and shading by slats, or in any way that will allow the air to circulate over the boxes. The young plants will need watching to prevent "damping off" when they appear above ground. One can buy plants a few inches high cheaper than he can raise them.

Miscellaneous

P. Mc D., West Fork, Ind., asks, 1, for information about the Perkins and Kallista Grape.

ANS.—1, The Perkins is a Labrusca grape. Husmann describes it thus:—"Bunch medium, rather loose, shouldered; berry oblong, pale red; with fine lilac bloom, sweet but foxy; apt to drop from the bunch when very ripe. Ripens as early as the Hartford Prolific, healthy, hardy, and very productive; generally sells well in market; a strong grower, with thick, leathery leaves. We know nothing of the Kallista.

G. K., Litchfield, Mich., asks whether the RURAL Dent Corn will mature in that section.

ANS.—Very likely it will, with an ordinarily favorable season. The Blount Corn matured in some places as far north, although it originated much farther south. We expect the Rural Heavy Dent will thrive over as wide a range of country as any of the well known varieties.

J. K. R., Cato, N. Y., sends specimens of ears of the R. B. Sorghum, cut Sept. 22, and asks whether it will mature seed.

ANS.—The seed sent would mature even though frost came at once after they were cut.

Geo. T. Whitmore, West Union, Fayette Co., Iowa, asks for the names and addresses of some breeders or dealers in Polled cattle in that or one of the adjoining States.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, OCT. 8, 1881.

THE
Rural New-Yorker,
A National Journal for the Country and Suburban Home.
PUBLISHED EVERY SATURDAY.

Conducted by
ELBERT S. CARMAN.

Address
THE RURAL NEW-YORKER,
No. 34 Park Row, New York.

SATURDAY, OCT. 15, 1881.

If the Rural New-Yorker is not received promptly when it is due, subscribers will confer a favor by notifying us at once.

Put your name and address upon the box or package or parcel, friends, when you send us grapes, apples, pears, insects, flowers, or anything. Please bear in mind that we receive many such, and that we cannot place the letters or postal cards which may arrive, days before or after, with the parcels, unless the address is written upon them in full.

"A farmer who places his corn in a silo should clearly understand that in doing so he destroys a considerable amount of the food which the corn contained when introduced." See Dr. Lawes's article, page 705.

Thanks—thanks for a gentle little rain that has invigorated our drooping wheat plants. We could have sacrificed our main wheat plots without loud murmurs; but our little plots—our specialties that we have worked so hard to get together—our pets, we could *not* spare them. Their loss would be irreparable to us—indeed to our readers.

We find that our reproduction of the Shropshire Ram "Dudmaston Hero," Fig. 476, page 669, is presented without credit to the London Agricultural Gazette, in which the original engraving appeared. We should have made this acknowlegement to any paper, under any circumstances, but we are the more anxious to reproach ourselves for the oversight to the Agricultural Gazette, because that journal is always scrupulously careful to give credit where credit is due.

Latest.—The first frost occurred at the Rural Farm, Oct. 5. The drought is not yet broken and the farmers cannot plow for wheat. Some of the wheat sown at the Rural Farm about Sept. 20, is dying. The lower the roots of the young plants extend the less moisture they find. What little moisture there is in the soil seems to be confined to within a few inches of the surface. It is safe to predict thus early that the wheat crop in this section of country for 1882 will be *light!*

We find the followiug item in our respected contemporary the London Agricultural Gazette, the first farm journal of England: "And an American contemporary which has just arrived (the Annual Fair edition of the Rural New-Yorker) is brimful of the same teaching. It gives long accounts of comparative trials of cereals; stating the average length of ear, of straw, the yield in bushels, and weight per bushel, with a minuteness of detail of which, except at Rothamsted, we have no parallel in Great Britain."

A prominent member of the Illinois State Board of Agriculture said to our Western agent a few days since, that our Wheat Special was worth $10,000 to the farmers of Illinois alone, and that the State would do a good thing if it would appropriate $10,000 for subscriptions to the Rural New-Yorker—said papers to be sent to prominent farmers throughout the State so that they could get the benefit of our Experiment Station, as the great State of Illinois is too mean to run one for itself.

The average ear of the 12 ears of the Rural White Dent, which took the first premium at the Mineola Fair, is 12½ inches long, has 16 rows and 52 kernels to the row. All were well filled out at both ends; the kernels are large and placed as closely as possible. This well-marked variety shrinks far less than the Chester Co. Mammoth and is, judging by the past most unfavorable season, the best white dent corn we have ever raised or seen. The illustration in the Fair Number of the Rural as the typical ear, is not at all exaggerated.

National Finances.—The financial affairs of the Government are in a very prosperous condition, judging from the debt statement for the first quarter of the fiscal year, which closed on the 30th ult. The aggregate receipts for that time were over $107,000,000; for the same time last year they were $98,000,000, or an increase of $9,000,000, which isn't so bad, after all! Should the reduction of the public debt continue for the three quarters ensuing, in the same proportion, the total amount of reduction July 1, 1882, would be, in round numbers, $148,000,000, as the estimate for the first quarter is $37,000,000. However, we should be content if that magnificent sum is not quite reached.

The Weather.—Until the 5th inst. we had not fully realized that Autumn had come, so long had Summer prolonged its stay, but the frost of Tuesday night served as a reminder. There is nothing phenomenal in the coming of frost at this time of the season, except its suddenness, for last year, according to the Signal Service reports, frosts were recorded as early as Aug. 16 in Massachusetts, New Hampshire, New York and Pennsylvania, while by Sept. 15 they were quite general. From our news columns it will be seen that nearly every section of the country was visited with frosts last week, and that considerable damage was done to ungathered fruits and vegetables. In Pennsylvania grapes were frozen on the vines, while in the most northern tobacco-raising States the "weed" was much injured. The prospects now are that a warmer wave is approaching and that we may yet enjoy our usual Indian Summer.

The Michigan Relief Fund has grown to nearly a quarter of a million dollars, but it is estimated that at least five times this amount will be needed to keep the people of the afflicted region from absolute want during the coming Winter. In the time of Ireland's distress, a couple of years ago, America generously sent food and money to relieve the famishing and clothe the ragged. Shall America be less liberal to her own children than to her neighbors? The contributions to the fund for Mrs. Garfield have already amounted to over $350,000, and with the insurance on her husband's life, the liberal appropriation in her behalf which Congress is sure to make, and her present possessions, it is estimated that she will have at least $500,000. Many of our most influential papers are therefore suggesting that all future contributions which the generous and philanthropic may feel disposed to make, should help to relieve the deplorable need of thousands in the burnt district rather than further swell the Garfield fund, already large enough to meet all reasonable wants or wishes. We hope that thousands of our readers have already contributed the price of that "Michigan Bushel" of wheat towards helping their co-workers, and those who have delayed doing so we would remind that he doubles his gift who gives it promptly.

THE RURAL CROP FORECASTS AND H OUTCOME.

In our Special Crop Number of June 25 last, in summing up our conclusions drawn from upwards of 2,000 reports sent to us from all parts of the country, we ventured to predict that the total wheat crop of 1881 would be 20 per cent. below that of 1880. "The latter," said we, "has been estimated by the Agricultural Department at 480,849,723 bushels, so that, on this basis, this year's aggregate crop can hardly be far from the neighborhood of 380,000,000 bushels." Furthermore, for reasons previously given, we expressed an opinion that the Department's estimate was from fifteen to twenty million bushels too high, and that, therefore, a corresponding reduction should be made on the above estimate of ours. This would make the aggregate yield this year from 360,000,000 to 365,000,000 bus. This estimate was made six weeks before the average harvest time. After the harvest has been completed, Bradstreet's has made a careful investigation of the aggregate yield of wheat and corn, and from 3,000 trustworthy reports estimates the total yield of wheat at 368,962,000 bushels—or within three million bushels of our estimate nearly four months earlier.

Of the corn crop of 1881 we said in the same issue: "According to the Department of Agriculture the total yield last year was 1,537,535,000 bushels, from which a deduction of 15 per cent. would leave 1,308,535,000 bushels as the aggregate of this year's crop. Inasmuch as the corn crop is made in July or August, however, there is still time for a great deal of improvement," or, of course, of injury. With anything like an ordinary season for making the corn crop our estimate of the out-turn of this would, we have no doubt, have proved comparatively as close to correctness as our estimate of the wheat crop. Owing to the very unusual drought that afflicted most of the country during the critical period for corn, the injury to the crop has been greater than could have been foreseen at the date of our report. Bradstreet's estimates this year's total crop at 1,193,641,000 bushels, or about 115,000,000 bushels less than our estimate—by no means too high an estimation of the loss from the widespread severity of the drought. In the shorter interval between our estimate of the wheat crop and the harvesting of it, the weather was ordinarily favorable for wheat, and therefore our conclusions approximated very closely to the truth; in the longer interval between our estimate of the corn crop and the harvesting of it, the weather was unusually unfavorable for corn, and therefore our original estimate of the shortage was too low; but since then we have several times revised our original views as the drought extended its ill effects.

THE RURAL'S PRETENSIONS.

Why is it that so little attention has been paid to the improvement of our cereal crops—the most valuable of the world? It is hard to answer, unless it is that we are so prone to overlook the great problems of life while wasting our energies upon those trifles that can yield no substantial benefit to mankind. Suppose that Charles Darwin, instead of spending years upon the investigation of so-called carnivorous plants, had devoted his incomparable talents to the improvement of those plants immediately serviceable to man, what might we not have looked for as the results! Until of late years, no systematic, scientific labor has been bestowed upon the corn plant; which, we cannot doubt, is destined, at no distant day, to stand first among America's farm crops. And yet no other plant is more susceptible to improvement by careful crossing and selection. And with wheat—who, until within a few years past, has attempted its improvement? Among the Experiment Stations of this country, the Rural Farm stands almost, if not quite, alone in its endeavors to originate and disseminate superior varieties of grain. We have now 25 different kinds of wheat which have originated at the Rural Farm, nearly all of which, in its sandy soil, promise to far excel the Fultz and Clawson which—as if there were no other wheats—are the reigning favorites of our country.

In our present Free Seed Distribution we send out Mr. Wysor's Fultzo-Clawson and Surprise Wheats, after testing them for several years. This is the beginning of the dissemination of improved cross-bred varieties, and ere the merits of these have become well known, we hope to be ready to distribute other kinds of our own origination, which shall succeed at least where those fail.

The Rural New-Yorker has naturally been looked upon as seeking merely to advance its own interests through its Free Seed and Plant Distribution. The truth, however is becoming *felt*. The amount of money expended in our work of the past four years, and the earnestness with which that work has been conducted begin to tell their own story, viz., that the Rural has merely been selected as a medium—and an excellent one—of testing over a wide extent of country the seeds and plants which in its Experiment Grounds have given high promise of superiority, and of giving to them a quick and just celebrity or death. But decidedly improved kinds of plants can not always, or generally, be determined in one year or five, and we make bold to state our belief that the five years to come will afford our good readers far better evidence of the efficiency of our work than the past five years have done.

The Rural has received little encouragement from its brother agricultural journals. They have made no reference, as a class, to the corn, oats, wheats and other plants we have cultivated and disseminated over the country purely at our own expense, and without the faintest knowledge as to whether it would add a name to our subscription list or a mite to our income. As a matter of good faith to our readers; as a proof of the justice of our pretensions, we have in *every* case refused to sell a plant or seed to our subscribers, since to have done so would at once have impaired the reasonableness of our claim that "we are working in the interests of agriculture as our foremost aim."

But, as we have intimated, the truth is beginning to be *felt*. Our subscribers confide in us because we are consistent. The seeds and plants we have sent them according to their own testimony have in many cases proven more valuable than the cost of many subcriptions to this journal. Our subscribers—thanks to them—are beginning to do our motives justice; and our friends of the big-hearted agricultural press will follow them some day. It is a long lane that has no turning; but the longest lane will be found for those who profess a benevolent interest in any class or community merely to secure a livelihood to themselves. May the truth prosper; may we be successful in providing the means of doing good to farmers and gardeners according to our deserts; for there are few greater privileges or pleasures in life to those who have studied vegetable nature.

BREVITIES.

If the Rural New-Yorker is not received promptly when it is due, subscribers will confer a favor by notifying us at once.

We have never seen California pears so abundant and cheap as during the present season.

If the Rural New-Yorker is not received promptly when it is due, subscribers will confer a favor by notifying us at once.

Mr. Lovett's colored picture of the Manchester Strawberry in his catalogue, by no means does the size of that berry justice, as it grew at the Rural Grounds the past season.

At the New York State Fair there were 20 Clydesdales and 26 Percheron horses. A special prize of $100 was awarded to the Clydesdale stallion, Brown Glancer, whose portrait appeared in the Fair Number of the Rural New-Yorker.

The cabbages along the route to and from our farm present a deplorable sight. They are literally eaten up by cabbage worms. Cabbages are being peddled about the country for from 10 to 20 cents for poor heads. Would it not pay Western gardeners to ship to New York?

All of our young friends who desire to remain active members of our Youths' Horticultural club, are requested to send in their names and addresses before December 1st. We have selected a certain kind of seed to distribute among the members for another year and premiums for the best yields will be offered.

A new use for broom-corn is announced from Sutter Country, California, where a considerable amount of it is raised. A process is said to have been lately discovered by which "the finest and most delicious flour can be made from the seed" to the extent of half its weight, leaving the remainder a valuable cattle feed. It is predicted that the discovery will at no distant day "revolutionize the breadstuffs of the world."

The Seckel at the Rural Farm this year ripens two weeks earlier than the Seckel at the Rural Grounds. No rain, to speak of, has fallen in either place for about the same length of time. The soil of the Rural Farm, where the land is level, is sandy. That of the Rural Grounds, situated in a valley, is clayey. The Seckels of the latter are fully one-third larger than those of the former. We mention these particulars to show how a popular fruit may vary in localities separated by only 40 miles.

During the year ending January 1st 1881 we imported 56,000 bales of jute, worth $20 each. This was principally used for bagging, and came all the way from British India, paying a freight of $12 per ton; in addition to which the government levies an import duty on it. Jute culture has been successfully tried in Louisiana and Florida, and we learn from Jacksonville that the Okeechobee Land Company which has contracted to construct a canal across the Florida Peninsula and to reclaim a vast tract of swamp land by draining Lake Okeechobee, intends to experiment with jute culture on a large scale next year.

So much importance has the Illinois Central Railroad attached to the article, "Rye to the Rescue," written by our contributor B. F. Johnson and published in our Wheat Special of September 10, that the President, W. K. Ackerman, has had it republished in pamphlet form and is sending it to all the officers and agents of the road with the following note:

"I send herewith a number of copies of an article which appeared in the Rural New-Yorker, a short time ago, on the cultivation of Winter Rye. At the present juncture I think the suggestions in the article are well worth consideration, and shall be glad if you will circulate the pamphlet among the farmers in your vicinity, and send copies also to the newspapers."

In the case of Bliss vs. the New York Central Railroad Company, the facts were these: An engine drawing a cattle train was driven through the water on the track, although it was evident the engine fires would be extinguished and the cattle could not be taken out; and when the conductor was urged to telegraph for an engine to a town forty miles away, he refused to do so. The plaintiff recovered for injury to the cattle caused by the unusual confinement, and the company appealed. In delivering the opinion of the New York Court of Appeals, Judge Finch said that whether or not there was gross negligence in failing to send for the engines was for the jury to decide, and that it was negligence in the company not to supply sufficient motive power to move the train.

Farm Economy.

ENSILAGE.

J. B. LAWES, LL.D., F.R.S.

ENSILAGE has met with no favor in Great Britain. This is, I think, more due to the general growth of roots, which furnish abundance of food for the wintering of stock, than to any distinct investigations into the merits or demerits of the process.

Near London brewers' grains are sometimes placed in silos during the Summer months, when the supply is much greater than the demand and they will pay for storing; but these grains have already gone through the process of fermentation and have lost the greater portion of their starch and sugar.

The same may be said of the pulp of the sugar beet: here again most of the sugar has been abstracted, and it must further be borne in mind that both these substances are the refuse of some manufacturing process, which must be disposed of, and, if worthless, be either given or thrown away.

To make a silo of succulent vegetation abounding in sugar and other valuable elements of food—with the certainty that a very considerable amount will be destroyed—can only be advocated on very different grounds.

We know that corn, in the more succulent stages of its growth, contains a considerable amount of sugar—so much, indeed, that its manufacture has been suggested as an article of commerce.

I have myself never seen the products of a corn silo, but when I read of alcohol and acids as forming part of them, it is not difficult to conclude that the source of these is the sugar of the corn, and probably very little of this will be found remaining.

A farmer who places his corn in a silo should clearly understand that in doing so he destroys a considerable amount of the food which the corn contained when introduced.

With regard to the value of the process to a farmer in the States, I cannot pretend to form an opinion. The value of food may be so great at one period of the year, as compared with another, that the loss attending the operation may possibly yet result in a gain.

Corn is grown so cheaply in the States that a loss of food which would be considered ruinous in England might be there disregarded.

The advocates of the system say that although a good deal of the food of the corn is destroyed, some of the woody matter, which in its natural state would be indigestible, is during fermentation converted into food. It is quite probable that such may be the case. Experiments are still wanting to show what is the real loss which takes place. In order to arrive at any just conclusion, 40 or 50 tons of corn should be weighed into and out of the silo, and samples of the corn, as it goes in and comes out, should be submitted to careful analyses.

When the results were known it is possible that the exaggerated opinions which appear to prevail in some places with regard to the value of this process, might be reduced to a more rational level.

Rothamsted, Eng., Sept. 12.

Miscellaneous.

WHEAT IS QUEEN.

Rural Ramblings Down Red River.

MESSRS. HOLMES AND SWEETLAND.

[Special Correspondents of the RURAL NEW-YORKER.]

No one properly appreciates the attractions of scenes he is perfectly familiar with. The citizen who lives within a stone's throw of Niagara fails to compass the grandeur of the view. The Indian who stands with folded arms gazing idly at the beautiful Yosemite mutters his native "ugh!" and, wrapping his dirty blanket closely around him, seeks his smoky wigwam. So, to a great extent, we found the inhabitants who people the park region of Minnesota seemingly oblivious to the fact that Fate has cast their lines in one of the happiest localities we have ever chanced to visit. Not grand, not massive with giant hills, gaunt bluffs and mountains kissing the clouds, but a continuous "park" for over 100 miles after leaving the eastern terminus by either line of the St. Paul, Minneapolis and Manitoba Railway—a rolling, undulating, never-ceasing panorama of scenic beauties, coming in rapid succession as the swiftly-moving train rattles on to the famous wheat fields of the Red River Valley. As we swiftly pass, first on one side, then on the other, in quick succession appear the pebbly shores of pretty lakes—God's own mirrors—in which are daily, aye hourly, reflected the beauties of the skies, cloud pictures never-ending, ever-changing. Around the banks is a growth of forest timber from which even yet the timid deer is often seen emerging, while at varied distances are thrifty villages which have sprung to life, many of them since the building of the railway. At times we reach an elevation from which we can view the landscape for 20 miles around, and perhaps see a dozen lakes at once and the thrifty farms scattered along their borders. Speeding thus along we see hunters laden with spoils of the chase—ducks, prairie chickens, geese, etc.; sportsmen who prefer the rod to the gun, dragging from the shore magnificent strings of fish—pickerel, pike, bass and perch. By a special invitation we spent the Sabbath at "Fairview Place," the home of K. Kneutson of Osakis, which is upon the southern bank of Osakis Lake, 130 miles from St. Paul. Osakis is one of the thousand beautiful lakes which dot the park region, and it unites all the advantages desirable for a resort for hunting, fishing or pleasure. Fairview Place is all its name indicates and more. Here are a handsome, well-kept house, a number of cottages, a wealth of natural timber, a fleet of sixteen boats, etc., and the genial proprietor intends to do still more the coming season to increase the pleasure of tourists, sportsmen or travelers, who wish to pass a week in the health-giving pursuits for which opportunity is here afforded.

ON TO THE RED RIVER.

Once more seated in the clean cars of the "Manitoba Route" we speed along past many bodies of pellucid water, varying in size, until we emerge at last upon a level, which extends as far as the eye can reach. Here are thousands of acres just shorn of their wealth of golden grain, which appears in groups of conical stacks at varied distances, like the wigwams of the aborigines, who but a few years since peopled this region. We are in the famous Red River Valley, and we know it instinctively, but it is not as we expected to see it—an undulating plateau; but as level as a table as far as the eye of man can reach, with here and there a little strip of timber which indicates a stream meandering along, watering the fertile soil and at length finding its way to the Red River of the North; near which, we sped "down north" past the great divide and in frequent sight of waters which seek the great ocean through the far-distant Hudson's Bay. And this river—how we were disappointed! Instead of the magnificent current our mind had pictured, we found a sluggish, narrow stream, as brown and turbid as the Big Muddy, but of great consequence to this region, as it is navigable as far up as Moorhead and Fargo and traversed by nearly 30 passenger and freight steamers, receiving along its course many incoming streams, some of which are also navigable.

The wheat yield of the United States is estimated for this year to be between 350,000,000 and 400,000,000 bushels—furnishing the world to a great extent with bread. Is Cotton king? If so, then wheat should certainly hold the position and obtain the soubriquet of queen. A Cincinnati paper says, in a recent issue: "The progress in wheat culture in the United States possesses much interest and especially in view of the high price which it it now brings as compared with a few years ago. As recently as 1850 only about 9,000,000 acres of land in this country were devoted to wheat culture. By 1876 the acreage had increased to about 20,000,000, and in 1880 to about 38,000,000. Passing some other statements, we will comment briefly upon the following: "In average yield per acre, Stark Co., Ohio, occupies the front rank, producing 24,7 bushels per acre in 1879." Query? why not give the crop of 1880, in the same locality? "Next comes Portage Co., Ohio, producing 22½ bushels per acre." Inquiry will satisfy the writer of his mistake as to the best yields. Kittson Co., Minn., produced a yield of 22.92 bushels. "Michigan has 17 counties that in 1880 yielded over a million bushels of wheat; Illinois, 11 counties; Ohio, 7 counties—" which he kindly names, the largest yield being that of Seneca, 1,574,522.

He forgets(?) to mention, however, that during the same year Minnesota had thirteen counties with a yield of over one million bushels each; one having 2,740,962 bushels, and that, too, with the disadvantage of a far smaller population, and a newer country. We simply draw these comparisons because we do not want that Cincinnati paper to harbor the delusion that Ohio is the only wheat field in the world, and for the purpose of seeing fair play at all hazzards.

From Harpers' Magazine for September we quote a sentence suggesting quite the reverse. "The Red River of the North rises near the head waters of the Mississippi, but, flowing in the opposite direction to the larger river, forms the boundary between Minnesota and Dakota, and entering the Candian province of Manitoba, finally discharges itself into Lake Winnipeg. The prairie drained by this river and its tributaries contains, roughly estimated, 40,000,000 acres, and from our standpoint is the beginning of the vast section of fertile land, which stretching in a widening belt to the Rocky Mountains, is drained by the Saskatchewan River, and further north by the Attrabasca and the Peace," and no portion of it can excel or equal the fertility of the valley traversed by the St. P. M. and M. R. R. along the line of which, we gleaned the following statistical information, as being more satisfactory than conjecture. We should, however, state that the figures given include also also the counties in the park region, adjoining the prairie lands of the valley of the Red River of the North to the southeast, but all of them tributary to the Manitoba route. The yield for 1880 was 10,227,580 bushels of wheat, an average of 16.88 bushels to the acre for this tract as compared with the official statements of 13.30 bushels for the entire State while, dividing the sections of country named, the average yield for the Red River Valley of the crop for 1880, reaches 21.17 bushels of wheat to the acre; and this is increased in the crop of 1881, so far as results have been obtainable, to an average of over 24 bushels. The same tract produced also 149,950 bushels of oats. Of potatoes the yield was 1,096,706 bushels from 9,506 acres or an average of over 113 bushels to the acre. We saw also beets and other root crops of enormous size and remarkably large yield, evincing the versatility of the soil for an extensive range of products.

It would be difficult to fully comprehend the present, or anticipate the future of either the portion of Minnesota referred to or Northwestern Dakota, already resounding with the tread of the iron horse, with hundreds of miles of railway in process of construction and immigrants pouring in daily by the train-load. On the train which brought us up from Saint Paul on the St. P. M. & M,, we counted five well filled coaches. The population of the twenty counties through which we have traveled in Minnesota, was in 1875 by the State Census, 87,964, while the national enumeration of 1880 gave them 154,298, both being exclusive of Hennepin County. Parties interested in studying and familiarizing themselves with the topography of this State, or of the section of which we write, would find a valuable auxiliary, as we have, by consulting a sectional and railway map of Minnesota and Northwestern Wisconsin published by the Merchants' Lithographing Co., formerly of St. Paul, now (we believe) located at Fargo D. T., and comparing the statistics and resources therein given with the total area of the State, comprising 83,520 square miles—50,759,840 acres of land besides the 2,700,000 acres of water surface.

There are still opportunities here and there for securing Government lands under the homestead and other acts, although they are rapidly diminishing, as the entries in 1880 aggregated 18,271, covering 2,197,160 acres; besides 210,200 acres sold by the St. P., M. and M. from their immense land grant. Of the former it is impossible to ascertain the amount brought under cultivation, but of the latter there were 54,472 acres, this large amount being doubtless stimulated by the liberal rebates offered by the company, of $2.50 per acre for breaking and 50 cents per acre for the first crop produced. Standing where the Atlantic's roar greets one's ears, one thinks of this country as one far distant, and associates it with the golden tints and shades of the setting sun, or the trials and deprivations of the sturdy pioneer; but, standing here, we view the social, religious and educational privileges of our Eastern home, and with the great lakes, navigable rivers, and nearly 3,500 miles of railway in this State extending its steel length eastward, we cannot but deem our Eastern or Southern markets as right to the very doors of this inexhaustible wealth. The St. P., M. and M. Railway alone reports an increase exceeding 100 per cent. in its traffic over that of the same month of last year. The climate in this portion of the Northwest is pleasing, healthful and invigorating, and begets a just pride upon the part of its citizens in its position in the mortality statistics of the world, which show the death rate in Minnesota at one in 121; in the whole of the United States at one in 74, and in Great Britain and Ireland, one in 46. Supplement all these advantages and resources with the intelligent character of the people, the provision by law for free and universal education, with most of the religious and æsthetic surroundings of older State, and one realizes how great are its advantages for settlement.

CATALOGUES, ETC.

J. T. LOVETT, Monmouth Nursey, Little Silver, Monmouth Co., New Jersey. Catalogue of the new and promising Manchester Strawberry, with a colored plate.

ALSO, general catalogue of small fruits, with a showy colored plate of the popular Pocklington Grape.

QUARTERLY REPORT of the Kansas State Board of Ag., for the quarter ending June 30, 1881, J. K. Hudson, Sec'y., Topeka, Kansas.

Societies, &c.

SESSION OF THE AMERICAN POMOLOGICAL SOCIETY AT BOSTON.

[Rural Special Report.]

A PREVIOUS article ends with the close of the first day's session.

The report of the committee on foreign fruits was read by Mr. Ellwanger, of Rochester, N. Y., at the opening of the morning session on Thursday. In it the committee remarked upon the diminished demand for foreign fruits—a circumstance which they attribute, no doubt correctly, to the more perfect adaptation of the now numerous native varieties to our climates and soils. The subject of

GRAPES AND GRAPE CULTURE

was then taken up. Its consideration was opened by a carefully-prepared paper from the foster-father of the Delaware Grape, George W. Campbell, of Ohio, in which he confined himself mainly to the improvement of this fruit by artificial crossing and hybridization. He held that by this process varieties are likely to be produced equal to the best foreign kinds. As warranting this expectation, he referred to the wonderful improvements of the last few years, and hoped for still more wonderful results yet to come. He remarked that, even in our Northern States, we have a better climate than that of sunny France, and that the time is not far distant when America will stand first among vine-producing countries.

This essay was followed by the discussion of varieties in the order named in the catalogue of the Society.

ADIRONDAC elicited a considerable divergence of opinion. It was said to be successful in Rhode Island when grafted upon hardy stocks. It was also said to be successful with some growers in Michigan, while several others urged that it be stricken from the catalogue.

AGAWAM was commended by President Wilder, except that the bunches were often small. Rev. Mr. Burnet, of Ontario, said the proper way to get good bunches is to give the vine room and let it run. It was commended for Michigan, Ontario and Eastern New York, although Mr. Strong, of Massachusetts, differed from the President as to its desirability for that State.

ALVEY found no one disposed to commend it, for it was generally regarded as unsatisfactory.

BARRY was commended by the President as an excellent grape, as handsome as the Black Hamburgh and much like Herbert. Several others similarly commended it.

BRIGHTON was commended as worthy of a star in Michigan, Ohio, Ontario and Virginia, but as only doubtfully successful in Missouri, when grown upon clay.

CHAMPION elicited wide differences of opinion. A motion to strike it from the catalogue was met by the statement that in Ohio it is the most profitable grape, while it was claimed to be profitable in New Jersey, Pennsylvania and Western New York. Yet another gentleman, in reply to the statement that this is profitable in the Canadian Provinces, asserted that in Montreal it cannot be sold at a cent a pound. Still it was said to be good for wine.

COTTAGE received but faint praise, although a star was proposed for Missouri.

CREVELING received the same treatment. It was found so unproductive at Philadelphia that a 50-acre vineyard had been dug up.

CROTON was universally condemned as unsatisfactory, doubtless on account of its tendency to mildew.

CYNTHIANA was passed, with little discussion, as a grape mainly valued at the South.

DELAWARE also was passed, with little discussion, as successful in Maine, one of the most valuable in Massachusetts, though liable to mildew. In New York it is but partially successful. In Missouri it does better than Concord. [This does not accord with my observation in that State.] In Michigan it is one of the most valuable.

DIANA, much to my surprise, was most strongly commended for Georgia.

ELSINBURG, Elvira, Essex, Eumelan and Goethe each received at best very doubtful commendations.

HERBEMONT was commended from Ohio and Texas as their best wine grape.

IONA received the highest commendation as to quality, but was said to be only locally successful. It was thought that it would be found successful when grafted on vigorous, healthy stocks.

The successful varieties in Georgia were spoken of somewhat at length by Mr. Bertram, of that State.

THE JOHNSON GRAPE was recommended from Virginia and South Carolina.

LADY was commended as early and good, following Moore's Early.

LINDLEY was commended by President Wilder as the best of the Rogers's red hybrids.

MASSASOIT was commended as one of the

best in Rhode Island, Ohio and Western New York.

MARTHA was condemned in Rhode Island and Ontario, but was said to be more profitable than the Concord in the Hudson River region, and successful in Connecticut. [Where are the olfactories of the purchasers?]

MERRIMAC was said to be superior to Wilder in Western New York.

MOORE'S EARLY is claimed to be two or three weeks earlier than Concord, with larger berry, but of less vigorous growth.

PERKINS was commended from Georgia, but was thought too poor to be retained on the list. It was evidently more popular at the extreme South.

SALEM was said to be very fine in Michigan, New Jersey, Virginia and Pennsylvania, but was condemned in Rhode Island and Connecticut.

TELEGRAPH, UNION VILLAGE and WALTER received little or no commendation.

WILDER was commended as the best of the Rogers's hybrids.

WORDEN was held to be best of all the black grapes in Georgia; earlier and better than Concord. Also esteemed in Connecticut, New Jersey, Ontario and parts of Massachusetts.

After going through with the list, opportunity was afforded for the consideration of new varieties, whereupon the following were named and discussed:—

EARLY DAWN, one of the best in quality, but doubtful as to foliage.

MONROE, a cross between Delaware and Concord; early, vigorous, delicious.

NORWOOD, said to be larger and better than the Concord; "very good" to "best;" vigorous, a long keeper.

MCDONALD'S ANN ARBOR: very large, black; quality like that of Concord.

WHITE ANN ARBOR (Woodruff's) on exhibition, with berries dropping badly from the stem.

RED SEEDLING (Woodruff's): bunches very large; a week or ten days earlier than Concord.

The last three are exhibited in the Michigan collection.

JEFFERSON looks like Lindley; not foxy; almost as good as Iona, and better adapted to the climate of Massachusetts.

NAOMI: large clustors, but not large berries.

POUGHKEEPSIE RED, although called "now," was on the Society's tables 21 years ago.

POCKLINGTON, NIAGARA, DUCHESS, PRENTISS and LADY WASHINGTON, all of which had been examined by the Fruit Committee two years since, were again under consideration; but the discussion elicited no new or important facts respecting them.

On the conclusion of the discussion the Society adjourned to three o'clock P. M.

The afternoon session was opened by P. T. Quinn, of Newark, N. J., with an address on

STRAWBERRY CULTURE.

He had, within the last dozen years, changed his views as to the proper methods of growing strawberries. He was now assured that the best of soil, with thorough culture, is required for the production of fine berries and profitable crops. Until recently he had planted in Summer, but he had found Spring planting more profitable. He gives clean culture till the middle of September and then mulches for the Winter, raking off the covering in Spring. He does not use horse power in cultivation during the bearing year, because the feeding roots come too near the surface. After describing his method of dealing with pickers, he stated that he had produced over 171 bushels from a single acre. He expected next year to produce from 125 to 160 bushels to the acre. He thought almost any good soil could be made to produce 100 bushels to the acre. He makes it a rule to test the promising new varieties. He considered the Charles Downing the best, all things considered. Boyden's 30 was popular with dealers. His last crop netted him 14 cents per quart.

Dr. Hexamer followed, dwelling largely on the importance of irrigation. He agreed with the previous speaker in his preference for Spring planting, and thought the Wilson one of the best shipping berries.

The meeting then proceeded to the consideration of the varieties named in the catalogue. Owing to unavoidable duties at the exhibition hall I was not present at this discussion. I learn, however, that, as might have been anticipated, the broad extent of territory represented developed great contrariety of experience with the varieties considered. I learn also that when the second fruit on the list—the Bidwell—came under consideration its originator, B. Hathaway, of Michigan, was found to be present, and, when called out, he gave a history of its origin and parentage, thus dissipating the uncertainties that have heretofore prevailed respecting it. ***

MONTREAL HORTICULTURAL SOCIETY SHOW.

[Special report to the RURAL NEW-YORKER.]

THE constant and increasing success of this active society ought to be an encouragement to those interested in horticultural pursuits in and around every city or large village in the country. It seems evident that when the right methods are used, such societies are maintained, I cannot say without difficulty, but with no more difficulty than attends all useful enterprises. "No good thing without labor," is a universal rule. The work of a horticultural society is eminently useful, yet there seems a lack of disposition almost unaccountable, to put the needful labor into the work among horticulturists everywhere. The city of Springfield, Mass., is filled and surrounded with gardens and cultured people, yet the Springfield Republican, recently alluding to their horticultural society, said that last Winter, when for a joke there was a rumor spread that a considerable balance in the society's treasury was to be divided among the membership, there was a full attendance, but that since then hardly half a dozen could be got to the meetings, and the society was evidently dead. Are the lovers of fruits and flowers throughout the country so sordid as this, and are such the reasons why the continuous success of our societies is so difficult? I cannot think so, and yet it is evident that the steady progress of any such organization is almost always based on the unremunerated and self-sacrificing labors of a very few. A lady once said to me that it seemed to her that gardeners were generally a churlish sort of persons; and I was moved to say in reply that there was, indeed, much in the conduct of those who visited their grounds to make them so. Even among themselves, however, there frequently appears a lack of fraternity, such as the editor of the RURAL sometimes complains of as existing among the members of the agricultural and horticultural press. Selfishness is, indeed, too common amongst men and women in all grades and occupations.

The recent exhibition of our Montreal brethren was a real triumph and a marked step in advance even of their previous very excellent shows. The display of large and well grown tropical plants was truly most extensive and magnificent, testifying not only to the skill of the gardeners of the city, but to the taste and liberality of their employers. The same can be said also of the show of greenhouse plants of every class, of ferns and cut flowers of every description, and of fruits grown under glass, especially grapes and peaches. The display of the products of the vegetable garden was most creditable, and in this poor year for melons it was remarkable to see the magnificent specimens displayed not only here, but in the markets and upon the hotel tables. I was told that considerable shipments of Montreal-grown melons had been made to Boston and New York this season, and that they brought the highest prices in those markets.

The show of out-door grapes was also surprisingly fine, embracing several hundred plates and nearly 90 varieties, including all of the newer sorts, and some nearly entire suites of the Rogers's, Arnold's and Ricketts's seedlings, with others less known to fame. These grapes were, most of them, very well matured, and the Brighton, Niagara, Prentiss, Pocklington, and Wellington were shown in a condition to to give a very favorable opinion of their merits.

Since at the American Pomological Show at Boston one of the members of the Montreal Society won a medal for his beautiful exhibit of apples, it need not surprise any one that in a combined effort the tables devoted to this fruit glowed with the beauties of form and color. It seems unquestionable that the long days of high latitudes tend to the development of bright colors in fruit, and it is certainly a distinguishing characteristic of Canadian apples. Along with these high colors go also high and spicy flavors and aromas, as is amply attested by many favorite varieties which, aside from the Fameuse, are little known outside of the province of Quebec. The RURAL has presented cuts and descriptions of some of these to its readers, the chief of which for excellence, the Fameuse Sucree, the Decarie and the Bourassa, ought to be more widely known.

The electric light was brought into requisition at the Montreal show during the evenings, and its effect in bringing out the colors not only of the fruit—and the flowers, but also of the gay and tasteful apparel of the thousands of ladies who thronged the immense hall of the Victoria Skating Rink in which this exhibition was held, demonstrated that this method of illumination had here found a most fitting opportunity. T. H. H.

ILLINOIS STATE FAIR.

[RURAL Special Report.]

THE 29th annual fair of the Illinois State Agricultural Association opened at Peoria, Ill., September 26th and lasted until October 1st. The grounds are pleasantly situated about a mile from the center of the city, and are probably the handsomest grounds used by this Association, which holds its fairs generally in different places each year. They have plenty of shade, and the people of Peoria have shown great enterprise in fixing them up so that, with the buildings put up by exhibitors, there is every convenience for making a fine exhibit. The hotel accommodations at this place are miserable, and if it had not been for the Committee of Public Comfort, who made arrangements for rooms and board outside, and the great number of people who threw their houses open to visitors, I do not know what the great crowd of Thursday would have done. Wednesday and Thursday were the two fine days of the fair, and the attendance was very large, amounting to over 30,000 people on Thursday, running the gate receipts up to nearly $14,000. This is the largest day's receipts ever taken in by this Society. About 4,000 visited the fair on Friday in a drenching rain that drove exhibitors and all to shelter; but they were there to see the fair and no rain could keep them back. The show in all departments was very large and fine, and as the Society, even with the rainy weather, find a handsome surplus in its coffers, and exhibitors, as a rule, are well satisfied, there is a good prospect that a still larger fair will be held at this same point next year.

I heard a great many complaints about the judging of cattle, and I think this Society, as well as some others I could mention, should pay more attention to the selection of competent and expert judges to decide on the merits of pure-bred stock. They should pay them well and compel their attendance. This picking up of judges at the last moment on a fair ground to fill vacancies often results in getting men who, while they may be perfectly honest in their convictions, are not sufficiently acquainted with the breeds which they are called upon to judge. I heard one member of a committee ask one of the breeders of Polled Angus cattle, "Are those cattle imported from Poland?" and I saw one or two cases where a great deal of dissatisfaction was given through similar ignorance.

There were 543 horses on exhibition, about equally divided between draft and roadsters. The exhibits of imported and grade Normans and Clydesdales were especially fine, and the show they made in the ring attracted, for a wonder, nearly as much attention as the agricultural horse-trot, which, I am sorry to say, is again encouraged by this Society. Mr. E. Dillon, of Bloomington, Ill., made a very handsome exhibit of Normans, and carried off 15 first and second prizes. E. Hodgson and E. D. Fuller also made large exhibits in this class. In Clydesdales Robert Halloway, of Alexis, Ill., made the largest exhibit and carried off five first and three second prizes. The sweepstakes agricultural stallion prize in this class went to one of Powell Brothers' horses, exhibited by E. Hodgson. The number of exhibitors in this class was very large, and the show in the ring for sweepstakes numbered 24 stallions and 13 mares.

The show of cattle was very fine and extra-large, no less than eight herds competing for the beef sweepstakes, and 13 for the dairy sweepstakes. New York and Ohio were well represented. The Short-horns numbered 71. Messrs. J. H. Potts & Son, Sandowski and Rayburn were the largest exhibitors. The herds shown by Potts and Sandowski were the same exhibited at the Chicago fair, where Messrs. Potts & Son carried off the sweepstakes premium for beef. This herd is headed by the bull "Master of Richmond," which won six first and five second premiums here. H. Sandowski's fine herd bore away the sweepstakes beef premium here after a very sharp competition, eight herds competing, comprising Short-horns, Herefords and Polled Angus.

Of Herefords there were 75 on exhibition. C. M. Culbertson's fine herd, headed by the bull "Sir Garnet," attracted a great deal of attention, as did also the herds of Thomas Clark and William Constable. It seems curious that these purely beef cattle should be beaten by what you Eastern men call a milk-and-dairy breed, but out here Short-horns are bred mostly for beef.

As a beef breed, the Polled Angus promise in a short time to compete closely here for preëminence with both the Short-horns and Herefords, as they are already doing in Great Britain. Of the 23 on exhibition Frank Redfield, of Batavia, N. Y., exhibited a fine young herd, headed by the young bull "Manrico," and including Princess Eighth, whose picture appeared in the Cattle Number of the RURAL. He carried off first premium in each class where he could enter, having done the same at the Chicago fair. Messrs. Anderson & Findlay also showed a herd of this breed, but they were not in as good condition as they might have been.

In Holsteins there were 42 competitors for honors, but New York bore them all away with the fine herd of the Unadilla Valley Association, of West Edmiston, N. Y., known as the Dutch Friesland herd. This is the same herd that carried off the $500 sweepstake dairy prize at Minneapolis, and it won the same prize here after a very sharp competition, over 13 herds contesting for it, including Jerseys, Ayrshires and Devons. The Holsteins are making a good impression wherever they are exhibited. W. A. Pratt also exhibited a fine herd of Holsteins and was awarded a sweepstakes premium for his cow "Astria."

There were 60 Ayrshires and the competition between them was very strong. Fine herds were shown by J. F. Converse, Woodville, N. Y.; John Stewart, Illinois; A. J. Wilson, Ohio; W. F. May, Illinois, and others. Mr. Converse carried off the herd premium with the same herd that won the young herd premiums at Chicago and Minneapolis. He also got six first and two second prizes.

In numbers the exhibit of Jerseys surpassed any other breed, amounting to 112 head. As might be expected, the competition here was keener than in any other class, no less than 13 cows competing for the four-year-old-and-over prize. It was as fine a show of cattle as I ever saw in any ring. The largest exhibitors in this class were Messrs. Hoover & Co., Columbus, Ohio; E. H. & S. S. Tripp, Illinois; W. L. Gardner, Ohio; George Merna, Illinois, and others. Messrs. Hoover & Co. showed their fine "Eastwood herd," including the fine cow, "Pride of Eastwood," that took the sweepstakes premium at Chicago for the best dairy cow of any breed and any age. He was also awarded the sweepstakes dairy herd prize at Chicago. Much dissatisfaction was expressed in this class, as well as in the Ayrshire, at the awards made by the judges, not only in some of the classes, but also in regard to herd premiums.

Messrs. D. J. Whittemore, Ohio; O. B. King, Connecticut; William Younger, Illinois, and L. F. Ross, Illinois, were the largest exhibitors of Devons, which numbered 83. Some very fine cattle were shown, including Mr. King's fine herd from Connecticut. Mr. Younger carried off the herd premium.

Of sheep there were 243 long wools, 208 fine wools and 195 middle wools. Not only were most of the breeders in the State well represented, but a large entry was also made in each class by Messrs. E. & O. Sorley, of Canada, who brought down some very fine animals and carried off a number of premiums.

The swine show, as is usual in this State, was truly excellent. There were 201 Berkshires; 96 Essex; 200 Poland-Chinas; 51 Jersey Reds; 112 Chester Whites; 102 Yorkshires and 63 Suffolks. The black breeds, it will be seen, made the largest showing, although the white breeds are increasing fast in this vicinity.

Fruit, Flower and Domestic Hall was very attractive. The exhibit of cut flowers made by E. Wyman & Co., Rockwood, Ill., was very fine; but the amateur show, on account of the drought, was not as good as usual. Mr. Baller, of Bloomington, Ill., exhibited a good collection of plants. The fruit show was good and large, but I did not see anything novel. Apples and fruit generally—what there were of them—looked better than expected. Hiram Sibley made a very handsome exhibit of floral requisites and horticultural tools in this building.

In Manufacturers', Vegetable and Dairy Hall the show was light. The Union Pacific Railroad Company's exhibit of grasses, cereals and vegetables grown in the Mississippi Valley, and occupying a corner of one wing of the building, was the feature of the display in this hall. In the dairy department two samples each of butter and cheese constituted the show. Messrs. Cornish & Curtis made a handsome display of rectangular and box churns and butter-workers, and the Cooley Creamer was shown up in good shape by John Boyd, of Chicago, Ill.

The agricultural implement and machinery exhibit was the largest ever seen on the State Fair Grounds. All of the principal plow sulky, cultivator and harvester manufacturers were on hand, and some of the machines were finished up in a style fine enough for parlor ornaments. Kingman & Co., of Peoria, had a fine building and represented 14 large firms. Many other dealers had also erected buildings and represented numerous parties. Large and prominent concerns, like John Deere & Co., had buildings of their own well filled with the products of their factories. P. P. Mast & Co. made a very handsome display of grain drills. Walter A. Wood showed automatic binders and full lines of reapers and mowers. Saw mills, tile mills, thrashers, traction engines, wind mills, corn shellers, etc., were in profusion; but, with the exception of a hay and hog rack combined, there was nothing strictly new. Many improvements were shown, and, take it all in all, if we except the rainy Friday, the 29th Illinois State Fair was a success. I must tender thanks to the officers of the Society for many courtesies. W. H. K.

THE VERMONT STATE FAIR.

[Special Report to the RURAL NEW-YORKER.]

AS usual, the State Fair at Montpelier was favored with good weather, and the pecuniary results were quite satisfactory. The exhibi-

tion of horned stock, though very good in quality, was not nearly as large as at some former fairs; and, judging by the last three, there is a steady lessening in interest in this department. Geo. L. Reynolds of Burlington, made the largest exhibit of Short-horns—13 from his herd of 63, headed by Kirkleavington Le Grand 3d, bred by L. B. Cannon, of the same locality, who has lately sold his herd of Bates cattle, mostly to the West. Kirkleavington is said to be the only pure Bates bull in New England at this time. The only other herd exhibited was by C. K. Gray, of East Montpelier, though a dozen or so of individual specimens were brought in. The interest in Short-horns is decidedly on the wane in Vermont. The same may be said of Devons, though the number of these shown was in excess of that of the Durhams. Hungerford & Dyke, of Shelburne, showed a fine herd of 17, eight of which were a recent purchase from Mr. Sessions, editor of the Devon Herd Book. Geo. Daves, of East Montpelier, had a good herd of seven, and there were some minor exhibits. There was a still greater falling-off in Ayrshires, which seem to have retired, thoroughly beaten in public opinion by the Jerseys. Even of this popular breed the exhibit was small compared with those of former years, only two parties contributing, the chief of whom, in numbers at least, was H. W. Keyes, of Newberry, who had an excellent herd of 13. A few Holsteins and Guernseys, with a meager show of grades, working oxen and fat cattle, seemed to make it plain that the close devotion of Vermont farmers to butter dairying is excluding from our farms nearly every sort of cattle but Jerseys and Jersey grades.

In the sheep show the Merino took the lead as usual, yet only four flocks were in competition, Dean and Jennings, of West Cornwall, getting the gold, and L. P. Clark, of Addison, the silver medal for flocks. The other prizes were divided between all the competitors pretty evenly. Down sheep, Shropshire and South, were represented by two flocks and a few smaller entries, all very good. Cotswolds, hitherto a distinguishing feature of this fair, hardly second to Merinos, showed an equal or greater falling-off, our Canadian friends being conspicuous by their absence, and the State breeders represented only by a single flock and a few single specimens. I am unable to say what is the cause of this general falling-off, but certain it is that many county fairs have had better and larger exhibits of live stock than were to be seen at our State Fair this year.

As for swine, they are never many, and were less than usual here; while of poultry, which last year were brought out in by far the largest and best collection ever seen in the State, some 20 exhibitors, more than half local, comprised the entire exhibition this year.

The exhibit of farm machinery and implements of all sorts was as large and varied as usual, and is really of more general interest and importance than any other part of our fairs, judging by the attention bestowed upon it by visitors. Space does not admit of particularization, but about all that was of note or value find a place in the RURAL from time to time. Dairy implements and mowers have hitherto drawn the bulk of the attention, but I am glad to report a rapidly increasing interest in instruments of tillage, indicative of a profitable drift in the agricultural mind. Grass and butter are the main things for Vermont, but our excellent soil is capable of yielding profitable crops for shipment in much greater profusion than hitherto, and the indications are that we are increasing the area of tillage throughout the State, without any decrease of our grass products.

The only thing in which a great and decided increase was shown at this fair was in the department of fruit. Fruit in all the ripening colors of Autumn blazed in every nook and corner of Mechanics' Hall. It usurped the tables extending through its center and overflowed upon the tables extending along the sides. There was never so large an exhibition in Vermont. There were some 30 exhibitors and 700 plates of specimens. This fine and instructive show was simply the result of a little energy and work on the part of the venerable Judge Miller, superintendent of this department, who, though past his three score and ten, has set an example, which, if followed by his coadjutors in other departments, will enable me to give the RURAL a more encouraging account of succeeding fairs by our State Society. Very little money (not nearly enough) was appropriated for this department, but *work* did it.

The show of dairy products, maple sugar and other Vermont staples is always, for some reason, very meager, and this year it was even less considerable than in years past. A little zeal expended here would yield proportionately as remarkable results as in the fruit department. The floral show, limited chiefly to amateurs, was yet very fine, the vicinity of Montpelier being noted for the taste and horticultural skill of its lady gardeners, and the liberality with which they bring out their treasures for exhibition on occasions like this.

Our State Society (unlike that of New York) is in close alliance with the trotting horse (or rather the horse-trotting) interest, and spends the bulk of its money on this department. Here, too, the results of energy *and* money are seen in many entries and very good sport for those that like it. Horses are class "first" on the premium list, and this is right enough. There was a fair count of entries for legitimate premiums, and superior animals took the gold and silver medals and other prizes in this class. But the largest appropriation went to the trotting purses, and here concentrated the rowdy, gambling crowd which this use of money tends to encourage and increase, and which exercises so vile and demoralizing an influence upon the young men of the farm who assemble on such occasions. It is an unmistakable curse which almost, if not quite, offsets the benefits of these exhibitions. But the farmers, the religious farmers of the State, are alone to blame. By becoming members of the State Society and attending its business meetings they may easily make it all that they desire. Leaving it, as they do, to a small number—practically almost a close corporation—in which the horsemen are a majority, they must take the responsibility which belongs to them for whatever is amiss in our chief agricultural holiday season. T. H. H.

THE RHODE ISLAND STATE FAIR.

[RURAL Special Report.]

THE 61st annual meeting of the Rhode Island Society for the Encouragement of Domestic Industry, was held at Narragansett Park, near Providence, commencing Sept. 27, and continuing four days. The weather was particularly fine, the attendance good, and the exhibition throughout a complete success. It has not been my good fortune to visit this place in former years; but I am credibly informed that in many respects this meeting has been more successful than any held for many years.

The pomological display was, however, deficient in quality and quantity here as at other fairs I have attended during the year, the drought having materially affected this part of the exhibition.

In the stove department I noticed a fine display made by the Rumford Chemical Works of Providence; and as a convicing proof of the excellence of their baking powder, they dispensed thousands of biscuits made by their preparation much to the satisfaction of the hungry crowd of visitors congregated in front of their booth.

The cattle department was unusually fine, and contained some of the finest animals ever shown on the grounds. The Hon. Joseph F. Brown, president of the Association, had, for exhibition only, a fine collection of Ayrshires, including a fine bull three years old, and several of his progeny. Fine Ayrshires were also shown by Obadiah Brown, Henry E. Smith, John Dimon, Isaac Hazard, Seth R. Davis, the Dexter Asylum and the State Farm. Some very fine Swiss cattle were exhibited by D. G. Aldrich and John H. Bancroft, of Worcester, Mass., the latter carrying off the first herd premium for his excellent herd of this breed, as well as the second premium for his three-year-old bull. George J. Martin showed seven head of fine Devons, and Harvey Dodge, 12 head of the same breed. The Guernsey breed was well represented by Joseph F. Brown's exhibit. At the head of A. Warner's herd of the same breed was Gypsy Boy, dropped September, 1877, one of the finest specimens of this breed in the country. William H. Hopkins showed 16 head of Ayrshires, 18 Jerseys, and one grade from his famous stock farm, which did credit to his care and success in breeding. Jerseys were also shown by Judge C. S. Bradley who received several premiums. Twenty-four head of grade Ayshires were shown by W. P. Larkin. Among bulls entered for the special premium offered by Hon. E. D. Pearce, president of the Ayrshire Breeders' Association, was one owned by Bela J. Stone, Westboro', Mass., which the RURAL will probably soon illustrate. The tent for the display of agricultural implements is filled nearly full with the displays of local hardware dealers, and but little room is left for manufacturers. In fact, the tent is too small by one-half for the purpose intended and in this particular the officers might make a decided improvement, by allotting more space for this department. Plows made by the Wiard Plow Company, Smith, Whitcomb & Company, Ames Plow Company, Remington and Syracuse Plow Company, were among the exhibits. The Monitor, Yankee, Bay State and J. H. Thomas & Sons' hay rakes attracted a considerable attention. The Acme harrow, the La Dow disc harrow, and others were noticeable, and so were the Warrior and Buckeye mowers. Road machines made by S. Pennock Sons & Co., and the Eureka, were seen in operation, doing their work well and to the satisfaction of all. Dairy implements were well represented.

The Vermont Farm Machine Company, of Bellows Falls, Vt., exhibited a full line of their Cooley Creamers, the Davis Swing Churn, Nesbit Butter Press, and the Eureka Butter-Worker. These implements attracted much attention, the principles of submerging milk for raising cream being so useful and practical that all visitors were interested and satisfied that the Cooley creamer possesses merits which make it a leading creamer of this country. The committee awarded it and the Davis Swing Churn each a first premium. The Cooley also received first premiums at the New Jersey State Fair, the Connecticut State Fair, the Pennsylvania State Fair, the Ohio State Fair, and the tri-State Fair at Toledo, Ohio. As a further evidence of the merits of the Cooley, butter made by this creamer received the first, second and third premiums at the New England fair at Worcester, Mass., the first premium, a $50 silk dress pattern, at the St. Lawrence County fair, a $60 silk dress pattern at the Broome County fair, and many other premiums at other fairs where premiums were offered. The sales have increased largely every year, and in all cases the workings of the creamer have been satisfactory and the results far exceeded the purchasers' expectations. The Stoddard and Blanchard Churns, and Moseley's Creamery were also shown. G. B. B.

Domestic Economy

CONDUCTED BY EMILY MAPLE.

HINTS.

A LITTLE lard or butter improves bread or cake made of Graham or Indian meal—it makes them more light and tender.

Soda or baking-powder biscuits must be handled as little and made as rapidly as possible.

Fresh lard is better than butter to grease cake-pans.

Ink stains on mahogany or black-walnut furniture may be removed by touching the stains with a feather wet in a solution of niter and water—eight drops to a spoonful of water. As soon as the spots disappear rub the place *at once* with a cloth wet in cold water. If the ink stains then remain, repeat, making the solution stronger.

Silver that is not in use may be kept from tarnishing by burying it in a box or barrel of oat-meal.

Pencil marks can easily be removed from walls, wood-work and marble by rubbing with a damp woolen cloth and a little sapolio.

Fine wire milk-pail strainers that become stopped up may be readily cleaned by rubbing with a damp cloth dipped into baking soda.

To tell Good Flour.

It should be white with a yellowish tint. Squeeze some in your hand, it will retain the shape given by the pressure. Throw a little against a perpendicular surface it will adhere or fall in a mass.

Shammy Skins

Although these skins were originally from the chamois, the most now in use are taken from the flesh side of sheep-skins which have been split. The skin, after passing through the ordinary processes of washing, etc., are soaked first in lime-water and then in a mixture of bran and water or in a weak solution of sulphuric acid, after which they are beaten in a mill until no moisture remains in them. They are then saturated with fish-oil, again beaten and more oil applied. When thoroughly impregnated with oil they are hung for a short time in a room heated to a given temperature after which they are carefully washed in a solution of potash.

To Detect Adulteration in Ground Coffee.

Place a few grains in a saucer and moisten them with a little cold water. Chicory will very soon become soft, while coffee will take a long time to soften. Again, fill a tumbler full of water and gently drop a pinch of the coffee on the surface. Pure coffee will float some time while chicory or other soft roots will soon sink, changing the water to a brownish or yellowish color.

Rhubarb for Summer Complaints.

Rhubarb I find to be the best medicine in derangements of the stomach and bowels, as Summer complaint, cholera infantum, cholera morbus and such like. Every family ought to keep this harmless and yet effective drug on hand, particularly where there are children. Put in a teacup one teaspoonful of the powdered rhubarb, a little bicarbonate of soda (saleratus), a few drops of essence of peppermint and sugar enough to sweeten. Pour the cup nearly full of boiling water. Let it settle and get cool, then give a teaspoonful of the clear liquid every hour or oftener, and more if necessary. Rhubarb is a purge, yet given in often-repeated, small doses it checks looseness of the bowels effectually and leaves them in a better and healthier state than any other remedy I am acquainted with. T. GR.

DOMESTIC RECIPES.

Fried Egg-Plant.

Make a thin batter of two beaten eggs, one-half cup of milk, a little salt and flour to thicken. Slice and pare an egg-plant and place in salt and water for an hour. Dry the slices between a towel, dip each piece into the batter and fry in hot fat to a good brown.

To Wash Bed Flannel.

Mix a handful of flour with a quart of cold water, put over the fire and boil ten minutes. Add this to some warm suds and wash the goods very gently. Rinse in three or four warm waters. A. E, M.

Baked Pears.

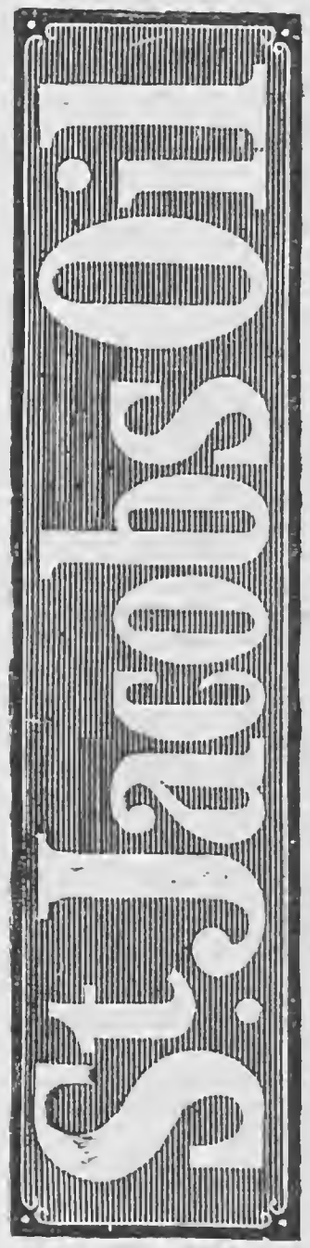
Peel ripe pears, cut in halves and pack in layers in a stone-ware jar. Strew a little sugar over each layer. Pour a small cupful of water, to prevent burning. Cover tightly and bake three or four hours in a well-heated oven. Let them get very cold before serving. Eat with sweet cream.

To Prepare Ox-Gall for Washing Colored Clothing.

Empty the gall into a bottle, put in a handful of salt and keep closely covered. A teacupful to five gallons of water will prevent colored articles from fading. J. V. D.

Miscellaneous.

The Philadelphia Easy Hour mentions Mr. J. A. Walton, of 1245 N. Twelfth street, that city, as an enthusiastic endorser of St. Jacobs Oil for the relief and cure of diseases of horses.



THE GREAT GERMAN REMEDY FOR RHEUMATISM, NEURALGIA, SCIATICA, LUMBAGO, BACKACHE, GOUT, SORENESS OF THE CHEST, SORE THROAT, QUINSY, SWELLINGS AND SPRAINS, FROSTED FEET AND EARS, BURNS AND SCALDS, General Bodily Pains, TOOTH, EAR AND HEADACHE, AND ALL OTHER PAINS AND ACHES.

No Preparation on earth equals ST. JACOBS OIL as a SAFE, SURE, SIMPLE and CHEAP External Remedy. A trial entails but the comparatively trifling outlay of 50 CENTS, and every one suffering with pain can have cheap and positive proof of its claims. DIRECTIONS IN ELEVEN LANGUAGES.

SOLD BY ALL DRUGGISTS AND DEALERS IN MEDICINE.

News of the Week.

HOME NEWS.

MONDAY, Oct. 10, 1881.

THE Republican State Convention was held in this city on the 5th, and was organized under the Presidency of Ex-Senator Thomas C. Platt. Senator Warner Miller was the temporary, and Mr. Chauncey M. Depew the permanent, Chairman. The nominations were:—General Joseph B. Carr for Secretary of State; State Senator Ira Davenport for Comptroller; Leslie W. Russell for Attorney General; General Husted, of Westchester, for State Treasurer; Silas Seymour for State Engineer, and Judge Francis M. Finch for Judge of the Court of Appeals.

In the vote for a United States Senator, taken in the separate houses of the General Assembly of Rhode Island on the 4th, Mr. Nelson W. Aldrich received 55, a majority of all the members of the Assembly.

On the night of the 4th inst. frost was reported to the U. S. Signal Station in this city from Erie, Pa., Boston, Mass., Davenport, Iowa, Detroit, Mich., Grand Haven, Mich., LaCrosse, Wis., Oswego, N. Y., Pittsburgh, Pa., Portland, Me., Sandusky, O., St. Paul, Minn., and from our exchanges we notice that the sudden change was general throughout the country. In New England the temperature fell from 17 to 30 degrees, in the lake region from 14 to 20, in the Ohio Valley from 10 to 22 and in the Mississippi Valley from 10 to 22. The greatest fall was at Nashville, where a difference of 47 degrees was marked, the mercury falling from 59 to 12 degrees in twenty-four hours. At Norfolk there was a change of 40 degrees, at Chicago 36 and at Milwaukee 30. At Lewiston, Me., Stove, Vt., Wolfboro, N. H., Bangor, Me., Manchester, N. H., and other northern towns, snow fell and ice was formed. Much damage was also done to the tobacco crop in the South. The lowest temperature (38 degrees above zero) in this city was reached Wednesday morning at six o'clock, the average temperature for the day being 44 degrees.

The French guests arrived here on the Canada. They were met with an ovation at the pier, and were escorted by the Seventh regiment up Broadway to the Fifth Avenue Hotel.

In company with the State Reception Committee, they visited the Military Academy at West Point on Friday last. The ships-of-war Kearsage and Vandalia transferred the distinguished company to that point. On Saturday they proceeded to Niagara Falls.

Seoville, Guiteau's brother-in-law, has consented to act as the latter's counsel. He does not anticipate a speedy trial. He says the defense will be insanity, and that he undertakes the case at the urgency of his wife, Guiteau's sister, and almost the only friend the assassin has on earth.

Director of the Mint Burchard has issued the following: "The Government has fixed no valuation upon mutilated silver coin other than the market value of the silver they contain. They are purchased at the mints by weight, as bullion, and the value depends on the price of silver on the day the coin is received at the mint."

Two European steamships landed 1,483 immigants at Castle Garden on the 4th, the Sailor, from Bremen, 916, and the Erin, from Liverpool, 567. Among the latter are sixty-three of the exiled Hebrews from Russia, fourteen of whom will be sent to Houston, Texas; the remainder will be taken care of by the Local Committee until places are found for them.

The public will be gratified to learn that the work of repairing and renovating the White House is going on briskly; that plumbers are specially busy there; that the gas and sewer pipes are to be taken out and replaced with porcelain-lined piping; and that particular attention is to be paid to the condition of the bath-rooms, and their sanitary improving. There are to be new carpets also, with new furniture, altogether costing $10,000. The public received an impression during the illness of President Garfield that the White House was not a safe edifice to live in.

Geueral Francis A. Walker has been asked to accept the presidency of the World's Fair at Boston, contingently, we presume!

Forty-eight of the expatriated Jews who are now on their way to seek homes in this country arrived at the Castle Garden emigrant depot recently by the steamer Egypt, from Liverpool. There were 10 families among them, and all appeared to be active energetic, healthy people. They were met by a deputation of the committee lately organized in this city to advise and aid them and their suffering compatriots, and were sent to Chicago and Toledo, where efforts will be made to locate them and get them employment.

An Overworked School-Girl.

From one of this large class of sufferers we have the following testimonial:

"CINNAMINSON, N. J., Aug. 1, 1880.

"From a feeling of gratitude and a desire to benefit others in a like situation, I voluntarily give my experience with the Compound Oxygen Treatment. When I began it I had for more than a year been suffering from nervous prostration; for I belong to a class which increases yearly, viz. *overworked school-girls.* My general improvement for nearly two months after I began the Home Treatment was scarcely perceptible, but at the end of that time I began to improve, and now, after eleven months have passed, I can safely say that I have been cured. *I sleep and rest well, and am generally in the possession of a good appetite, while headaches and backaches are quite unheard of.* My throat is cured, and my voice is stronger than ever before. I surprise my friends by my greatly increased physical strength. The fact that I have induced several friends to try this Treatment is an evidence of my faith in its curative power." Our Treatise on Compound Oxygen, containing large reports of cases, and full information, *sent free.* DRS. STARKEY & PALEN, 1109 and 1111 Girard Street, Philadelphia, Pa.—*Adv.*

AGRICULTURAL NEWS.

MONDAY, Oct. 10, 1881.

THE following agricultural news has been culled from telegrams received here from Friday noon to date: EASTERN STATES.—Portland, Me.: The advance in breadstuffs is the most noticeable feature of the week's trade. Provisions and all country produce are likewise buoyant.....Boston, Mass.: There is a good healthy tone in the wool market and prices are well sustained with a good demand from manufactories. Sales of all kinds amounted to 2,500,000 lbs., including Penn. and O. fleeces at 43@45c. for X, XX, XXX, and above, Mich. at 41@43c., principally 42c. There has been a noticeable advance in flour and pork, the former reaching $10 a barrel wholesale, and the latter $24 a barrel for first class—the highest prices for several years. Demand consumptive rather than speculative. .....MIDDLE STATES.—Buffalo, N. Y.: Wheat dull; $1.58 bid for hard Duluth on spot. No. 2 corn, 72c. Cattle receipts for week, 10,355 head; prices stronger.....Philadelphia, Pa.: Three cargoes of wheat taken for Lisbon; but British shippers are not buying, and supplies of all grains are in excess of terminal storage. Prices ruling too high for large export trade. Demurrage of $1 per car being paid to railroad companies under protest. Owing to the break of the Chicago corner in corn, the closing prices of wheat and corn have dropped 2c per bush. Wool quiet, but prices very firm; the week's sales aggregate 650,000 lbs.....WESTERN STATES.—Detroit, Mich.: Wheat less active; most of it held against "options" (that is, against contracts for future delivery). Supply of pork and lard unusually small. Apples, beans, and potatoes scarce, with upward tendency. Local mills grinding to full capacity. No. 1 white wheat, $1.42⅝ cash; Nov., $1.45⅝. Corn, No. 2, Oct., 69c.; Nov., 70c.....Grand Rapids, Mich.: Owing to the drought there has been an increase of price in all farm products and every-day necessaries. Butter, eggs, potatoes, meat, poultry, etc., rule higher now than at any time since the war, and prices are still going up..... .....Chicago, Ill.: The "corner" in corn has burst up. Until Friday the receipts of grain were very heavy, as it was rushed forward to meet the obligations of the "shorts." Arrivals were 3,130,339 bush. of corn; 333,671 bush. of wheat, and 408,624 bush. of oats. Shipments: 1,133,704 bush. of corn; 209,679 bush. of wheat; and 440,022 bush. of oats, leaving 11,300,000 bushels of grain in store against 7,622,451 at same time last year. Elevator capacity is 19,000,000.....Cleveland, Ohio: No. 2 red winter wheat, $1.50; Timothy, $2.90; clover, $5.50@5.75.....Cincinnati, Ohio: Grain and provisions quiet. Wheat until Wednesday dull, but rallied on Thursday. Corn and oats slow and lower.....Dayton, Ohio: Tobacco raising an important industry here; the yield will be larger than was expected..... Milwaukee, Wis.: Weather changeful and stormy: considerble damage to unthrashed grain as the result. A large yield of potatoes, but the shortage in other parts of the country has caused prices to be double those of last year. Receipts amount to 15,000 barrels per day. Wheat changeful; prices 1@2c lower..... Minneapolis, Minn.: A good deal of threshing during the week; millers purchasing 100,000 bushels of wheat a day at the highest price for eight years—60 per cent. above last year's prices. Other crops turning out well. Large crops of potatoes selling for shipment at double usual prices, 80 cents. Over $120,000 daily required by millers to pay for wheat .....St. Paul, Minn.: Weather gloomy. The agricultural machinery trade reports a surprising promptness in the payment of farmers' notes. Prices for labor high.... Omaha, Neb.: Produce dealers jubilant at present high prices, which hold firm with an upward tendency. Labor high. Reports from all over the State show advances in grain, and farmers who have crops are doing well.....Denver, Col.: Flour and wheat steady. Hay on demand at better prices. Vegetables plenty.....St. Louis, Mo.: The Fair is attracting an unusually large attendance. Few fat cattle or good packing hogs are offered here now. The thin stock received goes off slowly and at raisers' loss. Sheep offerings are mean.

In Bradstreet's—the excellent paper published by the large mercantile agency of that name—there appeared last Saturday an estimate of the wheat and corn crops for 1881, founded on 3,000 reports from all the grain-growing sections. Of it this is a summary:

WHEAT.

	Bushels.
Western States	248,137,000
Pacific coast	33,325,000
Colorado and Territories	12,000,000
New England	1,000,000
Middle States	34,500,000
Southern States	40,000,000
Total	368,962,000

This is against 480,000,000 bushels in 1880, showing a loss of 111,038 bushels. Following is a summary of the yield of wheat in the Western States in bushels:

	1880.	1881.
Illinois	56,500,000	24,675,000
Indiana	48,400,000	29,750,000
Iowa	34,750,000	24,000,000
Nebraska	11,900,000	14,686,000
Michigan	23,375,000	18,640,000
Minnesota	41,500,000	33,170,000
Missouri	28,000,000	18,890,000
Ohio	48,500,000	35,815,000
Kentucky	9,000,000	8,087,000
Wisconsin	16,000,000	19,500,000
Kansas	19,500,000	19,949,000
Total	343,570,000	248,137,000

Returns of the corn crop are less favorable than those of wheat, but nevertheless will not be pleasantly regarded by the operators who have gambled upon a half crop. Summarized the corn crop of 1881 is as follows:

	Bushels.
Western States	869,241,000
Southern States	247,500,000
Middle States	62,400,000
New England States	7,000,000
Pacific coast	2,500,000
Territories	5,000,000
Total	1,193,641,000

The yield of corn in the Western States is shown by the following table:

	1880.	1881.
Ohio	119,910,000	74,250,000
Michigan	31,816,000	25,470,000
Indiana	98,228,000	75,950,000
Illinois	240,452,000	166,268,000
Wisconsin	38,767,000	37,200,000
Minnesota	15,478,000	17,200,000
Iowa	260,192,000	191,880,000
Missouri	160,463,000	125,240,000
Kansas	106,218,000	73,388,000
Nebraska	52,507,000	81,705,000
Total	1,130,052,000	869,241,000

The Southern States suffered largely from the drought, and the corn crop in Kentucky reaches only 40,500,600 in 1881 against 86,039,000 in 1880. Tennessee reports a shortage of 48 per cent—Virginia and Texas 40 per cent.—and nearly the same for West Virginia. Altogether the corn crop of the United States of 1881 is short about one-third of a usual yield. .....The value of the hay crop in New York in 1879 the census puts at $60,267,240—the most valuable in the Union..... One of the largest second crops of hay ever known in Maine—fully one-third of the fine first crop, quality greatly superior.....The International Dairy Fair at Cedar Rapids, Ia., takes place Nov. 29 and 30 and Dec. 1 and 2.....Christian Kroeger, dairyman, Sheboygan Falls, Wis., has just been fined $10 and costs for skimming milk he took to a cheese factory. Afterwards he paid the parties $60 damages rather than stand a suit..... ....At the late auction sale of the pure Polled Ayrshire herd of the bankrupt Marquis of Huntly, 32 head were offered, including 24 cows, the rest being bulls and calves. The cow Vine Smith brought $580, and the herd averaged $250 per head.....

The Louisville Commercial cites the case of Capt. Chas. N. Corri, of that city, who was cured by St. Jacobs Oil, after suffering for years with rheumatism.—York (Neb.) Republican.

Truths.

The truth is that no person pursuing indoor occupations, can expect to escape the consequences. Those great organs, the liver and kidneys, will become inactive, and they need just such a remedy as Kidney-Wort to keep them in healthy condition.—Household.

Prof. Horsford's Baking Powder.

BARON LIEBIG, the eminent German Chemist, said, "The Baking Powder of Prof. Horsford, I hold to be one of the weightiest and most beneficent inventions which has been made in recent times."

WE again call attention to the Robbins Washer and Bleacher of the Bissel Manufacturing Co., whose large advertisement appears in this issue. We have frequently spoken in strong terms of praise of both the article and the manufacturers. Our readers who want a really first class labor saver will do well to send for this washer.

Thousands of ladies have found sudden relief from all their woes by the use of Lydia E. Pinkham's Vegetable Compound, the great remedy for diseases peculiar to females. Send to Mrs. Lydia E. Pinkham, 233 Western Ave., Lynn, Mass., for pamphlets.

TROPIC-FRUIT LAXATIVE is the best and most agreeable preparation in the world for constipation, biliousness, etc. One-half to one lozenge is enough. Price 25 and 60 cents per box.

BURNETT'S COCOAINE

Promotes the Growth of the Hair,

And renders it dark and glossy. It holds, in a liquid form, a large proportion of deodorized COCOANUT OIL, prepared expressly for this purpose. *No other compound* possesses the peculiar properties which so exactly suit the various conditions of the human hair.

The Markets.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Oct. 8, 1881.

BEANS AND PEAS.—Beans hold their strong course, a good demand attending the higher rates. Red kidneys are wanted. New green peas in a small way quoted $2.10@2.15; old, $1.90@2. Southern B. E. peas $2.20@2.25 ₱ 2-bush. bag.

Marrow beans, new, $3.55@3.60; mediums, $3.50; pea, $3.35@3.50; white kidney, $3.50@3.55; black or turtle soup, $2; red kidney, new, $3.

Receipts of beans for the week, 11,692 bush.

Exports do. 265 bbls.

BEESWAX—Unchanged at 21@22c., the latter for Southern.

BUTTER.—Another quiet week is recorded. Fancy grades have sold up to arrival, but there is a large proportion of the supply that cannot be rated fancy, and it begins to look as if sweet and useful grades have been claiming too close a relationship with choice creamery. The butter market is not in good shape. Interior owners hold on stubbornly for nearly what is quoted here and quotations here have already restricted consumption. Such a combination would be apt to weaken any commodity, and fair table grades of butter are not indispensable when they go above the popular purse, especially when oleomargarine has tightened its hold upon so many outlets. Buyers are trying to induce holders of dairies to break off the tops, but it is too early in the season. A good many dairies are showing poor ends of Sept. owing to the heat of that month.

Creamery, finest tubs, 36@37c.; good to prime, 32@34c.; other quality, 24@26c.; sweet cream, 29@31c.; State dairies do. 25@28c.; do. half tubs, choice, 30@31c.; do. fair to prime, 25@29c.; Welsh tubs, 25@30c.; poor State, 20@25c.; Western imitation creamery, 20@30c.; do. dairy, choice, 26@28c.; other, 17@22c.; factory or ladle-packed June and Iowa, 18@19c.; other, 15@17½c.; common Western, 15c.

Receipts for the week, 42,345 pkgs.

Exports do. 1,142 do.

Cold storage to C. R., 90s.

The official figures of the amount of stock in this city for October are as follows:—

State creamery, tubs and pails	8,031
State creamery, firkins	1,819
Western creamery, tubs	18,432
State dairy, tubs and pails	7,810
State dairy, firkins	4,282
Western dairy, tubs	8,329
Western factory, tubs	48,669
Western factory, firkins	2,855
Total packages	100,227
Stock in Boston (pkgs)	42,945

CHEESE.—The stock in this city Oct. 1st is stated at 122,795 boxes, in Boston at 20,517 boxes, in Liverpool at 130,000 boxes. The market has been a counterpart of last week, dull and unsettled. Fine September cheese have been of uncertain value; some lots are reported to have been offered at 13c. The home trade has paid our quotations, or perhaps a shade more, for a limited quantity of State cheese. We hear of no sales of Wisconsin cheese. Ohio cheddars are scarce and nominal. Medium grades are dull; no export demand for them. Heavy skims are in very bad position. Receivers have been compelled to force lots not keeping well upon the peddlers at 25@30c. a box.

State factory, fine, 12½@13c.; good to prime, 11½@12c.; fair to good, 10½@11½c.; poor to fair, 10@10½c.; Ohio factory, flat, fine mild, 12½@13c.; good to prime, 11@12c.; fair to good, 10@11c.; creamery, partly skimmed, choice, 10@11c.; poor to good, 4@7c.; fully skimmed, ½@2c.; full-skimmed factory, ½@2c.

Receipts for the week, 40,258 pkgs.

Exports do. 18,080 do.

Liverpool cable, 64s.

Steam to Liverpool, 46s. 3d.@20s.

DRIED FRUITS.—Fine qualities of apples are firm and quite a number of evaporated have changed hands latterly in sellers' favor. Peeled peaches scarce and firm; unpeeled easier.

Apples, evaporated, new, 11@13c.; do. old, rings, choice, 13c.; do. fair to prime, 11@12c.; N. C. new, sliced, extra fancy, 8½@9½c.; choice, 7½@8c.; fair to good, 5½@7c.; Southern, new quarters, choice, 6@7c.; fair to prime, 5½@6c.; inferior, 5@5½c.; State, old, fine-cut, choice, 6½@7c.; quarters, do. 6¼@6½c.; small lots, 6¾c.; Ohio and Mich. choice, 6@6½c.; Western, fair to good, 5½@6c. Peaches, evaporated, peeled, 18@, 33c.; unpeeled, 26c.; N. C. peeled, new, fancy, 23@24c.; choice, 22@23c.; Ga. peeled, choice, 22@23c.; Southern, peeled, fair to good, 18@20c.; unpeeled halves, N. C. 9c.; halves, Tenn. 8½@8¾c. Plums, State, black, 17c.; Southern Damson, 14½@15c. Blackberries, 13@13½c. Cherries, Southern, dry, 19@20c. Raspberries, 28c. Huckleberries, 15½c.

EGGS.—Receipts for the week, 6,769 bbls.; do. last week, 7,357 do. Cool weather has given the market a good push and prices firm and quite close for all grades. Ice house eggs are hard to sell; they turn out poor this year. Limed are offering with a place for cheap use.

Near points, 25@26c.; State and Pa. 24@25c.; Canadian, 23@23½c.; Western, 23½@24c., under grades 22@22½c.; limed State 19@20c.; Western, 17@18c.

FLOUR.—In general sales flour has fallen off in prices, and were it not for the moderate supplies a sharp decline would be threatened. Buyers stocked quite freely when the offering was liberal, though in the excited feeling of the time they paid high figures. There is now a disposition manifested to hold off as long as possible in the expectancy of a favorable turn in rates.

No. 2, $4.50@5.10; State and Western, superfine, $5.50@6.10; city mills, extra, $7.60@7.85; Spring wheat, extra, $6.40@6.85; Spring XX and XXX, $7@8; patents, $8@9.50; Ohio round hoop shipping, $6.30@7.00; trade brands, $7.25@7.75; St. Louis extra, $6.75@7.25; do. double extra, $7.40@7.85; do. family, $8@8.25; Southern extra shipping, $7@7.50; do. XX and family, $7.75@8.50. Rye flour, superfine, $6@6.40. Corn-meal, Brandywine, $3.85@4; do. Western, $3.60@3.90.

Receipts of flour for the week, 97,486 bbls.; corn-meal 2,266 do.

Exports of flour for the week, 51,422 bbls.; corn-meal 1,675 do.

FRESH FRUITS.—Choice apples are firm and in demand. Exports for week 7,830 bbls. Many are going from Canada. Pears have advanced. Prime grapes doing better; common lots show. Cranberries have a fair outside demand. A supply of peaches is made up of odds and ends.

Apples, Western New York, prime mixed lots, ₱ bbl. $2.25@2.50; fair do. $1.50@2. Sweet, $1@1.50; King, $2.75; 20-oz. $2.37@2.62; Maiden Blush, $2..50@2.75; Fall Pippin, $2.25@2.37; Baldwin, Jersey, ₱ bbl. $1.75@2; Greening, do. $1.75@2. Baldwin, Jersey, bulk

$2,000 Worth of Valuable Gifts

For those who raise the best crops from the Rural New-Yorker's Free Seed Distribution of next year!

Its Free Seed and Plant Distributions during the past four years have placed in the hands of farmers and horticulturists some of the most valuable farm and garden plants in cultivation.

Its Experiment Farm (the first to have been established in connection with journalism), is worked in the interest of its Subscribers.

The Fair Number of the Rural New-Yorker explains all. It will be sent to applicants free.

You should subscribe for the Rural New-Yorker. It is a national weekly 16-page journal, with over 500 Original Illustrations per year. The best artists---the best writers. Ask those who know. Address

34 Park Row, New York.

$1.25@1.50. Pears, Bartlett, ice-house, prime ₱ bbl. $9@10; prime to good $5@8; prime, ₱ keg, $4@5; do. inferior, $2@3; Sheldon, Western N. Y. ₱ bbl. $3.50@5; Beurre Bosc, $4@7; Duchess, $3.50@4.50; Virgalieu, $4@5; Bourre d'Anjou, $4@5.50; Seckle, choice, $6@7; fair to good, $1@3; ₱ keg, $2.50@4; cooking, ₱ bbl. $2@2.50. Peaches, NewJersey and up-river select, fancy, ₱ bskt, $2.50; choice lines, $1.75@2; fair $1.25@1.50; common, $1@1.25; culls, 75@80c. Quinces, apple, up-river prime ₱ bbl. $3@5. Grapes, Del., State, case of 18 3-lb boxs, $4.50@5; bskts, choice, ₱ lb, 9@10c.; poor to fair, 6@8c.; Catawba State, bskts, ₱ lb, 5@6½c.; Concord, case 18lb bxs, $1.75@2; do. in bskt. ₱ lb, 3@4c.; up-river, loose, ₱ lb, 3@4c. Cranberries, Cape Cod, choice, ₱ bbl. $7; do. fair to good, $4.50@5.50; do. poor to fair, $4.50@5; ₱ crate, $1.75@2.50; Jersey, prime, ₱ crate, $1.50@1.75; do. poor to fair, $1@1.50.

Peanuts quiet and steady. Choice new shellbarks are in fair demand at $1.25@1.50 ₱ bushel; old and new inferior lots of new have sold at $1. Chestnuts scarce and in good demand; prices higher.

Peanuts, Va., hand-picked, ₱ lb, 7¼@7½c.; fancy, 6¾@7c.; extra prime, 6½@6¾c.; good to prime, 5½@6¼c. shelled, screened, 6@6½c.; unscreened, 5½@6c.; pecan nuts, 9@11c.; hickory, shell-bark, new, ₱ bu; $1.25@1.50; chestnuts, $9@9.50.

GRAIN.—The wheat market has lost its vitality and at the moment the outlook is dark and threatening. A number of failures at the West have cooled speculative ardor and spot and visible supplies begin to regain their natural influence in transactions. Shippers are sending grain products along with more regularity than they could or would while speculation was at fever-heat. No item of grain exhibits the full high-priced confidence that has ruled so long and the general tone of the market is downwards.
